THE PREPARATION OF LIQUID GOLD.  
&c., &c., &c.****TESTIMONIALS.**

MR. C. G. PICKING, Brick and Tile Manufacturer, London.

I have the pleasure to enclose my cheque in payment of your Book of Recipes. I think it well worth the amount; it must have cost you a great deal of time and money.

MESSRS. CARTER &amp; CO., Pottery, Poole.

We are perfectly satisfied with your Book; we consider it by far the best collection we have ever seen.

MR. JAMES PLANT, Stoke-on-Trent.

In reply to your inquiry as to the Book of Recipes, I beg to say that I am perfectly satisfied with the bargain.

JOHNSON WARDLAW, ESQ., Britannia Works, Glasgow.

I received safely the Book of Recipes you sent me. I am pleased with it, and consider it at the high price you charge much cheaper than many Books of Recipes sold for a great deal less money.

MR. C. E. COATES, Mold.

In reply to your letter of the 6th inst., I beg to say that I have tested many of the Recipes you sold me, and so far am thoroughly pleased. I consider the Glazes for one burning cannot be excelled, and the Red Staining process is highly satisfactory.

MR. W. J. WESCOMBE, Ashford, Kent.

So far as I have proceeded I am quite satisfied with the Glazing Recipes.

ADOLPH SIMON &amp; CO., Brick and Terra Cotta Works, Bohmen, Austria.

We are well pleased with the Recipes you supplied to us some weeks ago. We consider the Purple Slip used on our common clay the most valuable secret we possess.

M. SARGENT, Avenue de Orleans, Paris.

I find the matter very interesting, and hope to derive a substantial advantage therefrom.

JAPY FRERES &amp; CO., Lafeschotte, France.

We are much interested and pleased with them.

Published at **£30.** A few Copies may be had at **£5** each,  
on application, with remittance, to**GILBERT WOOD & CO., PUBLISHERS, 175 STRAND, LONDON, W.C.**

# The Architect.

## THE WEEK.

ALTHOUGH a complete series of works illustrative of the history of painting seems at present unattainable, owing to the difficulty of obtaining examples of Greek work, yet it is absurd to lead people to imagine that painting arose with CIMABUE. By introducing some Egyptian portraits out of Mr. FLINDERS PETRIE'S collection in the National Gallery, the old bounds are broken through. We may in consequence expect to see in the Gallery not only paintings of a very early date, but examples of English and foreign sculpture. Although the portraits were found by Mr. FLINDERS PETRIE in Egypt, it does not follow that they were portraits of Egyptians. They may represent foreign settlers who were buried according to the local rites. It must not be supposed that they are comparable to the Egyptian sculpture in the British Museum. They are interesting for their age, and as being the earliest examples of distemper painting in England. Of course great care will have to be taken of the portraits. The Egyptian papyri with which visitors to the British Museum were long familiar have had to be removed from the staircase walls, through fear of injury to the colours from exposure to the light. We may be confident that in the National Gallery no less care will be taken, and the old portraits could hardly be under more watchful eyes than the Director's.

THE exhibition of the Royal Society of Artists was opened in Birmingham on Tuesday. There are several works which have been seen in Burlington House, such as Mr. GOODALL'S *Misery and Mercy*, Mr. WATERHOUSE'S *Consulting the Oracle*, Mr. PETTIE'S *Scene from "Peveril of the Peak,"* Mr. SCHLOESSER'S *Beethoven*, Mr. HERMAN HERKOMER'S *Hubert Herkomer, A.R.A.*, Mr. MURRAY'S *Uplands of Picardy*, &c. The exhibition is therefore above the average. Whether provincial societies are wise in seeking so many works from the metropolis is another question. Unless we are mistaken, visitors rarely pay much attention to the works by local artists which are found in the round room of Birmingham. They seek out what comes from a distance, and the artists of Birmingham do not derive as much profit from the exhibition as they have a right to expect. Unfortunately it is necessary to think of the expenses of the exhibition, and consequently a crowd must be attracted.

AN Exhibition of Paintings by Old Masters was opened on Tuesday in the Municipal Art Gallery of Birmingham. The curator, Mr. WHITWORTH WALLIS, has been successful in obtaining works from the Duke of NORFOLK, the Duke of WESTMINSTER, the Earl of COVENTRY, &c. But it is probable that the pictures which will have most interest for connoisseurs are those from the gallery of Sir THOMAS BARRETT-LENNARD, of Essex. His collection has hitherto been unknown to the general public, but more than ninety pictures have been lent from it to the Birmingham Gallery, mainly portraits of the DACRE-LENNARD family. One of them is by HOLBEIN, a portrait of the Lord DACRE who was executed for his share in a poaching affray. Among the works lent by the Duke of WESTMINSTER is a *Holy Family* by FRA BARTOLOMEO, the most genial of the monastic painters. The *Tobias and the Angel*, by CLAUDE, well known from the English engraving, is also in the Gallery. Both REYNOLDS and GAINSBOROUGH are well represented.

THE staircase of the Hôtel de Ville, Brussels, on the walls of which M. WAUTERS painted two remarkable historic works, has been further adorned with six portrait-statues in alabaster by M. DE GROOT. The figures are portraits of eminent members of the Municipal Council arrayed in the costume of ancient celebrities. Thus, M. BULS, the well-known burgomaster, appears as ROGER DE LEEFDAEL, who was châtelain of the city in the thirteenth century. The militant councillor, M. GODEFROY, has the rôle of JEAN DE RELEGEM, who was a man of war as well as a scholar. The figures are shown in animated attitudes, and in that way appear more suitable for the ancient edifice than if they

were represented as immobile, and from the variety of costumes—military and civil—additional interest is imparted to the sculpture.

MR. ELLIS LEVER, who has the courage to support his convictions by his purse, proposes that an International Exhibition should be held next year in Dublin. After the fiasco this year in Kensington, few will care to see a repetition of that mode of rendering justice to Ireland. Mr. ELLIS LEVER would no doubt be willing to contribute liberally to an exhibition in Dublin, but he cannot be aware of what it would cost. In 1853 WILLIAM DARGAN, the contractor, who, like Mr. LEVER, believed in the efficacy of exhibitions, spent more than 50,000*l.* (some say more than 100,000*l.*) over one which was held on the premises of the Royal Dublin Society. It was thoroughly international, and a more attractive collection of paintings and other works of art was never seen within the walls of an exhibition. Several of the ablest experts in Ireland endeavoured to draw lessons from the exhibits for the benefit of their countrymen, but no gain of any sort was derived by Ireland from so much expense and enthusiasm. DARGAN was ruined by the exhibition, as the savings of many years of labour were expended in buildings and the payment of a horde of officials. Can Mr. ELLIS LEVER see any grounds for believing that a more fortunate issue awaits his proposed exhibition of next year?

WE are glad to find that Mr. HAWKSLEY has been successful in his action against the Liverpool Corporation; indeed, that result was to be anticipated, for the city on the Mersey has failed in all its undertakings of late years. It was shameful on the part of the Corporation to have defended the action. Mr. HAWKSLEY prepared the plans for the Liverpool Waterworks, and without the influence of his name no scheme of the Corporation was likely to be successful. But as soon as the Act was obtained and the works were started, Mr. HAWKSLEY was shelved. Allegations were made about his competency to design an embankment. The Liverpool Corporation seemed to think that the engineer who has had more experience than any man in England in hydraulic works could be ruined by their aspersions. An inquiry was got up, and, of course, Mr. HAWKSLEY was the gainer. He took an action to recover the balance of his fees, and the arbitrator has awarded every penny that was claimed. The unlucky ratepayers will have to pay the whole of the costs. No one will pity them, for in all questions relating to architecture and engineering, Liverpool has shown that the spirit of fair play has departed from the city.

THE August number of the *English Illustrated Magazine* contains an article on Rugby, for which Mr. W. H. OAKELEY has supplied sketches. His style is well suited for that class of work, as it conveys the impression made by buildings as a whole, and effect is not sacrificed for the sake of detail. Publishers have a prejudice against sketches by architects, believing that they are a sort of working drawings; but examples like those by Mr. OAKELEY in the *English Illustrated Magazine* are strong enough to disabuse people who hold notions of that kind. Mr. OAKELEY'S sketches show a power of recognising what is best in a building, and they are a great improvement on many of the architectural sketches which are seen in periodicals and newspapers.

THE new museum of the Luxembourg has been again reopened, after the closure which is necessary every year in order that the latest works purchased by the State may be introduced. But this time there are fewer changes than usual, for the most important of the works which were acquired from the last Salon will be kept for the International Exhibition of next year. The pedimental sculpture by M. CRAUK is now to be seen free from scaffolding and tarpaulins. While the relief was concealed it was supposed to be a glorification of sculpture, as the door over which the work is placed leads into the sculpture gallery. It is now found that painting has a share in the honours. In the centre is the figure of Glory, who with her right hand presents a crown to the representative of painting, and with her left hand honours Painting with a palm branch.

## THE BRITISH MUSEUM.

THE last return of the British Museum bears a close resemblance to a good many balance-sheets of public and private companies which appear about this time of year. The figures in it show signs of decline, as if the Museum had not escaped the general depression or was no longer able to compete with rival establishments. In 1885 there were 584,660 visitors to the General Collections, last year the number was 501,256. Taking the returns for the same years from the Natural History Museum, the numbers are respectively 421,350 and 358,178. If the totals of the two years are compared, we find a decrease of more than 146,000 people. Against the falling off in the visits of the general public may be set the increase of visits for study to special departments. Last year 182,778 people were admitted to the Reading Room, or an increase of more than 20,000 beyond the number for 1885; but, on the other hand, there were much fewer students in the Sculpture Gallery and the Gold Ornament and Gem Room.

The Trustees have more cause for dissatisfaction. The Turkish Government having declined in 1882 to renew the firman under which explorations were conducted for several years in Assyria and Babylonia, the most important sites have had to be abandoned. In consequence, the Arabs are seeking for treasures in their wild way, and stones which are records of the ancient empires are being scattered or destroyed. It was discovered that many tablets were in the possession of natives, but before any steps could be taken for their recovery they were seized by the Turkish Government and deposited in the Museum of Constantinople. The desire expressed by the Trustees for an opportunity to inspect the tablets and ascertain their character is a revelation of how the Turks aid in the diffusion of knowledge. Dog-in-the-manger fashion, the Turks will make no use of the tablets—possibly they are incompetent—nor allow any of their esteemed allies to do so. The Trustees say it is most desirable that they should have the support of the Government in seeking to obtain the authority to resume the excavations. It is not creditable to us as a nation that they should remain unfinished, and unless something is done to complete the work it would be better, for the sake of posterity, if we had not interfered with the places. All we have accomplished is to afford facilities for the dispersion and destruction of objects which were probably of extreme historic importance.

Another subject which demands prompt attention is the overcrowded state of the Reading Room in the Museum. Readers who have about twenty years' experience of the room often express surprise at the crowds which are now to be found there. To secure a seat it is indispensable to attend at an early hour. The extra tables which were supposed to serve in emergencies are constantly occupied. The number of readers has increased from 105,310 in 1875 to 182,778 in last year, and it may be assumed that this year there will be more of them. It would be satisfactory if one could be assured that the difference between the two years represented *bonâ-fide* students. But any supposition of that sort would be corrected by a walk through the room. The most cursory examination will discover that a very large proportion are employed in reading novels, or turning over the leaves of books of pictures. The Trustees fear that "literary men engaged in genuine research will gradually find themselves pressed out of the use of the room by the throng of readers for general information," or in other words, people who read for amusement will expel the men for whom the room was constructed. It is suggested that the difficulty might be met by having a special room with modern works for the seekers after general information; but it should also be possible to give less facilities to novel readers and seekers after amusement.

A cry for more room is also heard from the new Natural History Museum. It appears that within four years 270,000 specimens have been added to the Department of Zoology, and space is therefore much needed in galleries for mammals and fishes, and in the bird and insect rooms. Nowhere, it is said, is increased accommodation more necessary than in the "spirit building," which is so fully occupied that the collections of mammals and shells preserved in spirits have had to be transferred to the main building.

This state of things is a not uncommon case in Govern-

ment buildings. The officials dictate their requirements, and the business of the architect is to comply with them. But it generally happens that insufficient allowance is made for contingencies, and, as can be observed at the Natural History Museum, the additions of four years are enough to cause great inconvenience. What will be the state of the departments at the end of forty years, assuming that additions will regularly come in, it is not difficult to imagine.

The additions in the Book Department this year are mainly of a theological class. Among the manuscripts and documents acquired we find mention of a waxen book, 8 $\frac{3}{4}$  inches by 6 $\frac{1}{4}$  inches, consisting of seven wooden tablets, coated with black wax on both sides, and two covers waxed on the inner sides, inscribed with documents, written with the stylus in tachygraphic or shorthand symbols, and with a few memoranda in Greek. It is supposed to be of the third century. To the same period belongs a wooden board, 13 inches by 7 inches, painted white, and inscribed on both sides in ink, with thirteen lines from the "Iliad," iii. 272-285, probably for the purpose of teaching scholars. These objects are most interesting as revelations of ancient modes of teaching.

The report of the Departments of Prints and Drawings contains several interesting items. On the first page we find it stated that the series of drawings by JACQUES ANDROUET DU CERCEAU for his work "Les plus excellents Bastiments de France," which was formerly in the King's Library, are now in the Print Department, and therefore are more easily accessible. Among the additions are some studies by MICHEL ANGELO. On the back of sketches of ancient sculpture are eight studies of a figure of a child, which are supposed to be for the marble statue of the *Virgin and Child*, in the church of Nôtre Dame, Bruges. The design of this work is generally ascribed to the great artist, although the modelling having none of his "terrible manner" may have been entrusted to one of his pupils. A copy of the series of M. GUFFEN'S "Episodes de l'Histoire d'Anvers," which we reproduced this year, was also presented to the Department. The Museum has at length obtained the original design, by Sir R. WESTMACOTT, for the group of sculpture in the pediment of the portico. Additions have been made to the series of engravings illustrating the works of painters of all countries.

The acquisitions to the Department of Greek and Roman Antiquities comprise many things which are valuable. First is a collection from the excavations by Mr. FLINDERS PETRIE at Tel-Defenneh, or Daphnæ, in Lower Egypt. Admiral SPRATT has presented a marble torso of a *Dionysos*. Among the purchases are a large sarcophagus of terra-cotta richly painted, and of a late period of Etruscan art; a series of twenty-six moulds for terra-cotta from Tarentum; a gold necklace of delicate workmanship from Cyprus; a silver girdle of square panels connected with hinges, the ornament representing alternately two gryphons and a figure in Assyrian costume holding two wild goats; a lekythus or jug with figures—one of ATHENÊ differs from the rest in colour, as it is white with gilding, as if to suggest a chryselephantine statue.

Mr. A. W. FRANKS is not only the head of a Department, but one of the most liberal benefactors of the Museum. His name appears as presenting objects on almost every page. Among the gifts to his own Department are about 1,250 specimens of English pottery, including five of WEDGWOOD'S large portrait medallions, and several of the smaller ones. Mr. C. J. LUCAS has presented two Mediæval watering-pots found in Liverpool Street, which are rather rare objects. The Trustees of the Christy Collection have purchased the objects discovered by M. PECCADEAU DE L'ISLE on the banks of the river Aveyron, which represent prehistoric art. Among them are three sculptures in the round, two of them representing reindeer and the other a mammoth, and a number of drawings upon stone, some of which show great artistic power. They are well known to anthropologists, and are valuable, as they show that man's first attempts as an artist were not imitations of stitching, or the scratching of lines on gourds and pottery. Art began with imitations of living things, and the rude sculpture from Bruniquel demolishes the theory of SEMPER and other imaginative speculators of his type.

The acquisitions to the collections of Natural History do not much concern us, but it may be noted that Mr.

RUSKIN has presented his "Colenso Diamond," a magnificent symmetrical yellow crystal, weighing 130 carats, from South Africa; and his "Edwardes' Ruby," a unique crystal, weighing 163 carats, on the condition that the inscriptions he furnishes will always appear on the labels with the specimens.

### GLASGOW CATHEDRAL.\*

By JOHN HONEYMAN.

ALTHOUGH Glasgow Cathedral is one of the smallest, it is by no means the least interesting of British cathedrals. Like every other, it requires to be very carefully examined before it is understood; indeed, I know no other so likely to lead a hasty observer to false conclusions. The first thing which will probably strike the visitor to Glasgow Cathedral is the peculiarity of the site. Immediately to the west there is exactly the kind of site on which we would expect a cathedral to be built—the summit of a gentle eminence, with the ground sloping gradually from it in all directions, except north. But the building was reared entirely on the eastern slope, even the west gable being about 50 yards from the highest point, which was formerly somewhat further west than it is now. This peculiarity is not without significance. It points to the fact that even during the troublous times which preceded the constitution—or reconstitution—of the see by David I., all traces of the original Christian establishment had not been obliterated—that the spot where St. Mungo worshipped and was buried was still known and venerated. That spot was much more likely to be in the sheltered glen on the banks of the Molendinar than on the exposed knoll on which the castle latterly stood. Over the saint's tomb the new church would naturally be erected, regardless of the structural difficulties to be encountered.

As we have not even a fragment *in situ* of older date than 1180, we must begin our history there. That fragment, which is situated at the south-west corner of the present crypt, seems to indicate that the church built about that period had a crypt. Crypts were at that time fashionable, and here the configuration of the ground naturally suggested one. We know nothing more of this twelfth-century church, but it seems probable that it had no nave, as we find that very early in the thirteenth century a nave was designed and partly built, as it still stands. This has a Transitional base, and even its plan may be recognised as Transitional; but it is nevertheless unlikely that any of it was erected in the twelfth century—certainly no part of it above the level of the base course. Inside we find in this nave the bases on the bench-table with square plinths and delicate mouldings decidedly earlier in character than the bases in the crypt, but still distinctly thirteenth-century work. Towards the middle of the thirteenth century—not I think before 1240—the crypt and choir were erected. It seems quite evident that from the commencement of this great work operations on the nave were entirely suspended, but that the transept at least was completed about the same time as the choir. The work was thereafter carried on westward slowly but steadily till the nave was finished, about forty or fifty years after the choir. It will be noticed that the base of the choir is entirely different from that of the nave. The same base is carried round the chapter-house, which was probably founded at the same time; but the chapter-house above the level of the base was not built till after the completion of the nave—probably about 1425–1435. It was left down like the nave, so that nothing might interfere with the completion of the choir.

Immediately to the south of the transept there is a building carried up to the level of the choir floor, and evidently designed to be higher, which may have been intended as an extension of the transept, though I very much doubt it. This gives us the third variety of base which will be noticed on looking at the building, and no part of it was erected before 1480—probably later. It is, perhaps, as well when we come down to this period that our conclusions as to dates should be verified by documentary evidence, for whereas there is no material difference between English and Scotch contemporary styles down to the end of the thirteenth century, or nearly so, after that period they differ very considerably, and we find even local variations of Scotch styles. Anyone unfamiliar with the later Scotch styles, and who did not know that this crypt was erected by Bishop Blackadder in the sixteenth century, would be very much puzzled by this building. It is as unlike English work of the same period as can well be imagined. At first sight—looking at the outside of it—one would say that it was Early English. The builders seem to have done their best to copy from the adjoining crypt; the plan of the window jambs is very much the same, and even the mouldings, but I have never seen an instance where a late workman has managed to make an

early capital or base. The late work is sure to be detected there if nowhere else; and here, as both can be seen from the same spot, it is interesting to compare the one with the other.

The spire is the most modern portion of the building. The upper part of the tower was not erected till 1425 by Bishop Lauder, and the spire considerably later, so that we have the following sequence:—1st, portion of a building erected about 1170–1190; 2nd, a part of nave, circa 1200–1220; 3rd, crypt and choir, 1240–1280; 4th, upper part of nave, 1270–1300; 5th, chapter-house, circa 1425; 6th, tower, 1425 (Lauder); 7th, south crypt, 1500; 8th, spire. So that we have the remains of work done from time to time during a period of about 300 years.

I shall now refer to some of the most interesting and peculiar features of the building. The most interesting, of course, is the crypt. I have seen crypts which were as interesting to me, because more puzzling, but none so beautiful. In this respect there is nothing at all to compare with it. It was the last important crypt built in Britain, and the designer had at his disposal the whole resources of the perfected Pointed style. He had also a most suitable site for the purpose, and it must be admitted that he made the most of his opportunities, as both the general disposition and grouping of the parts and all the details are alike admirable. The approach to the crypt from the upper church is by two stairs going down north and south from the transept turning east into the aisles. The north approach, east from the transept, has been completed in accordance with what has no doubt been the architect's original design, but he has not been allowed to repeat his beautiful design on the south side. Here it is that the fragment of old work to which I have referred still remains. Even at the risk of spoiling the principal entrance to the crypt, and in spite of extraordinary difficulties, that ancient piece of wall and a few superficial yards of vaulting have been retained. It is difficult to imagine an adequate reason for taking so much trouble about this little bit. It will be seen that the walls of the small chamber have actually been built under its Transitional vault at three different periods! Perhaps the most striking feature of the crypt is the variety of effect produced by the disposition of the small piers carrying the floor of the choir. The usual formality of parallel rows of piers and arches of the same height is entirely absent; there is a symmetrical arrangement of groups, but even that is not at first sight apparent, so skilful is the plan and so varied the consequent treatment of the vaulting. The floor of the crypt under the lady chapel, following the slope of the ground, is on a lower level than that of the main crypt, so that here another element of variety is introduced. The eastmost bays are divided from each other by solid walls, no doubt for structural reasons. These walls however, are pierced by coupled trefoil arches utilised as piscinæ and credence tables combined—an unusual but very beautiful form. It will be observed that the one in the centre has been altered. The centre shaft and the trefoil arches have been cut out and a single arch inserted, in the beginning of the fourteenth century, as the arch mouldings plainly tell us. We have it also on record that Bishop Robert Wishart was buried here—between the altars of St. Peter and St. Andrew—in 1316.

At the south-east corner is a well, commonly called St. Mungo's Well, which has apparently been a source of danger to the building, which is here very much rent and twisted. At the opposite corner is a rich early door—the carving of which is much decayed—giving access to an apartment which I am inclined to think served as the chapter-house. I have never supposed that the apartment immediately above this was the chapter-house, but it did not occur to me that the one on the ground-floor (it is not sunk) may have been used for that purpose, till quite lately, when visiting it with Archbishop Eyre and Mr. Pugin, when the latter pointed to the raised canopied *sedile* at the centre of the east side as strong evidence of this. In the chapter-house at Inchcolm the seat is raised exactly in the same way, and at Crossraguel and elsewhere there is a similar niche formed. This lower apartment may have been in use ten years before the upper part was built. A turret stair connects it with the sacristy above, and with the lady chapel.

Returning to the transept by the north aisle, it will be observed that the vaulted porch at the transept door is much later work than the crypt. It is, in fact, late fifteenth-century work. I have no doubt that originally there was no communication between the aisles of the nave and those of the choir. The only communication between the nave and choir was in the centre, where the screen now stands. Perhaps the contraction of the central access by the erection of the screen suggested the idea of forming the connection between the aisles as we now find it—or nearly so. In the nave the most noticeable points are that the bases of the responds at the transept and the bases of the shafts on the aisle walls are distinctly older than the bases of the main piers and the bases of the west responds. The piers might at first sight be taken to be older than the piers of the choir, but while I think the builders have been influenced by an older design (as in the case of the chapter-house), they have taken such liberties with it in

\* From a paper read at the visit of the British Archaeological Association on the 27th inst.

matters of detail as to prove that the work was actually executed after the erection of the choir. Thus, on these piers we have not only the later base, but the fillets on the shafts, and a somewhat clumsy late variety of capital. Again, the mouldings of the arcades have rather an early look, but, of course, if I am right as to the piers, they cannot be early. I do not rely upon that, however. It is quite clear that these are not Transitional mouldings. We have such mouldings in their simplest form at Jedburgh, Dryburgh, and elsewhere, and there—as invariably during the Transitional period and for some time thereafter—each group of mouldings is in section square—at their greatest projection the mouldings would touch lines at right angles to each other. Here, however, each group would be enclosed by part of a circle, and being almost devoid of under-cutting they are entirely unlike anything to be found in the early part of the thirteenth century. They are also quite unlike the mouldings in the choir executed about the middle of that century, so that we really cannot find a place for them at all till near the close of the thirteenth century. We would not find a place for them then in England, but they illustrate the divergence in styles to which I have already alluded as beginning about this period; and, in fact, we find such mouldings with little relief slightly varied down to a very late period, as, for example, at Melrose and Haddington. The triforium is evidently later than that of the choir, and so is the clerestory. There is a peculiarity about the north clerestory wall which I sincerely wish did not exist, namely, that it is seriously “off the plumb.” I do not know the exact inclination, but I have no doubt it is more than two feet off the perpendicular. In the choir we have the somewhat unusual feature of a pier in the centre carrying the east gable, and over it four lancets, instead of the more usual five. The plate tracery of the aisle windows is also remarkable. The design of the lady chapel, and of its east end especially, is exceedingly elegant. At the south-east corner there is a piscina, which is peculiar, in that the drain is not taken down to the soil, but is simply taken through the wall and discharged through a gargoyle on the outside. I have not noticed such an arrangement anywhere else in this country, but it occurs, I believe, at Notre Dame, in Paris, where there is not the same excuse for it, the piscine being only a few feet above the level of the ground.

The chapter-house, as it is called—but what I prefer to call the sacristy—enters from the north side of the lady chapel. It is a lofty vaulted chamber, with a pier in the centre, but there is nothing to indicate that it was ever used as a chapter-house, but rather indications in its ample fireplace and ambries that it was meant for a sacristy. The south crypt, commonly called Blackadder’s aisle—or, more correctly, as Mr. Andrew Macgeorge has shown, the aisle of Fergus—is chiefly interesting as an illustration of the pertinacity with which the Scotch architects stuck to the earlier forms long after their use had been discontinued in England. From the outside this looks much more like Early English than sixteenth-century work, and even inside we can find no trace of the Perpendicular style, yet it was not begun till the very end of the fifteenth century, and was probably not completed till the early part of the sixteenth. With the exception of the effigy of Bishop Wishart, already referred to, and two stone coffins in the crypt—one of which has on its lid a very elegant foliated cross—there are at Glasgow no early monuments worthy of mention. This seems rather remarkable, especially as in the neighbouring churchyard at Govan a variety of most interesting pre-Norman monuments still remain. It is almost enough to raise a suspicion that St. Kentigern’s Cathedral has, after all, been reared on the wrong spot! The monument of Bishop Law at the south-east corner of the lady chapel is an interesting example of its kind, and there are several others in the same style outside worthy of notice.

Mr. Loftus Brock said it must be remembered that the British Archaeological Association existed not only to call attention to interesting points with respect to a building, but also to those which had regard to the stability of the structure itself. They had heard from Mr. Honeyman that some parts of the walls of the nave were actually 2 feet out of the perpendicular. Standing where he did he could see a defect in the structure which was far more serious than that. If they turned their attention to the lofty arch which supported the tower or spire they would notice a very dangerous crack not only on the north-east side, but also on the south-east side. It went right up through the spandrel of the arch, up to the roof, and through some modern facing, which was perhaps not yet twenty-five years old, showing that there was some motion in the building yet. He would venture to say that if the attention of the authorities was directed to it, grave structural loss would be saved. If the tower, which was unique in Scotland, fell down, it would not only be a heavy expense to rebuild it, but also a very great loss to the structure itself, because a tower rebuilt was never the same tower again. If it fell, it would fall to the east through the crypt and do a very great deal of harm. It must also be remembered that the foundations of old churches were never their strongest part.

Here they had the fact that the building had been erected on a hillside, and the movement with such a position was always downwards. Their warmest thanks were due to Mr. Honeyman for his paper; but he would ask Mr. Honeyman to reconsider the portion of his paper referring to the lady chapel. He ventured to think the arrangements on the east side would not be sufficient for a lady chapel, and he took it that this portion of the building was primarily intended for a retro-choir.

### TRONDHJEM CATHEDRAL.

IN an account of a visit just made to Norway, the following description of the cathedral at Trondhjem is given by the *City Press*. The old cathedral alone is worth a visit from London if only to gaze on such an ancient building, with its glories of the past, and its wondrous restoration of to-day. The Norwegians are proud of this old house of prayer, which has shared a worse fate than any English cathedral, the Abbey of St. Albans included. The accumulation of rubble and modern brick with which it has been patched up in the last two centuries is now giving way to stone, and most faithfully are the modern builders gathering together the fragments of the ancient builders’ skill of eight hundred years ago. The nave and aisles are now in the hands of the builder; huge engines are at work within, and the pavement is covered with a small tramway on which the stones are run in and out, and shot underneath the transepts, where service is now held, into the nave. The work completed is the exterior and interior of the eastern end. The southern door is a marvel of Norman architecture, and of Mediæval imagery and carving round the portal. The chapter-house is the most complete, and bears a great likeness to our own Temple Church, or rather the western end of it. The windows and pillars are said to have been designed and even worked by the same hands, and there is a stern simplicity about it quite unlike the adjacent part of the edifice, which is the choir or octagon, as it is called. The service of the English Church is here held during the summer months. The octagon or choir chapel is a masterpiece of architecture and of carving. There is a complete ambulatory, and in the wall of the sacred building itself most interesting features of Norman work, whilst the delicate carving of the arches which encircle the altar and its surroundings present the workmanship of a much later date. The reredos is of white marble, much resembling that of Exeter, about which so much litigation arose, and the altar is of white marble with grey plinths and pillars supporting it. In the transept, which is the most ancient part, wooden pews and seats, reminding one of the interior of St. Saviour’s, Southwark, are placed, but the shadow of antiquity is everywhere protesting against these modern abominations. On the altar table is a short surplice and a chasuble of red velvet and gold braid, whilst in the beautifully restored chapel of St. John the Baptist, now used as a vestry, are the plainer clerical garbs of the officiating Lutheran minister. Ascending some steps at the southern end of the transept, we pass along the triforium, and have a fine view of the cathedral below, and find ourselves in the chapel of St. Olaf, whose body the Danes have carried away, and in whose memory the great cathedral of St. Olaf, at Kirkwall, was also reared. The western end seems to have suffered the most, and the painstaking architect has gathered together fragments of pillars, windows, lancets, and arches, showing the missing links, and here from twelve to half-past one and from six till seven ladies of the district sell to the visitors pictures and views of the work of the restorer for the benefit of the fund. Sixteen thousand kroner are annually spent in a work which must go on for many years; two-thirds are found by the Norwegian Government and one-third by the communal or municipal authorities.

### NEWCASTLE SOCIETY OF ANTIQUARIES.

A VISIT was lately paid by this Society to South Durham, and in the course of the excursion the churches of Gainford, Winston, and Staindrop were visited, and described by the Rev. J. R. Boyle. He said that in the county of Durham the close of the eleventh century and the early part of the twelfth century must have been characterised by very great activity in the building of churches. There are very few churches which have not some architectural features belonging to that time. He believed he was right in saying of the majority of the churches in the county of Durham, that the principal portions of the structures belong either to the episcopacy of Bishop Pudsey or his immediate successors. The architecture of Gainford Church belongs to the time when the Norman features were passing away, and Early English features gradually were being introduced. In the grounds of the rectory there are a number of fragments of Saxon crosses; but in the structure of the church itself he believed there is nothing of an earlier date than the close of the twelfth century. He would

not be far from the truth if he said the arcades and chancel arches belong to about the year 1190. He explained various details in connection with the architecture of the church, and drew special attention to the decoration of the hollows of the capitals of two of the pillars, as being the first indication of decoration in such parts. The church, which has been carefully restored, was examined, and the old registers, which are well preserved, and the old communion plate, one piece of which is the manufacture of Ramsay, of Newcastle, were exhibited, and several interesting fragments of Saxon sculptured stones examined. At Winston Mr. Boyle briefly described the church, which, he said, judging by what remains of the original architecture, is of very little later date than Gainford Church; he fixed the date of the church at from 1210 to 1220. The walls of the chancel, a considerable portion of the north wall of the nave, and the arcade between the nave and the south aisle are old work; and the remainder of the church is modern work, and bad indeed as modern work. Built into the south wall of the chancel, on the outside, is a beautiful thirteenth-century grave cover. Mr. Boyle described the font, and expressed his belief that it is of the time of shortly after the middle of the thirteenth century. A well-preserved piece of Saxon cross was examined, and also the communion plate, one piece of which is dated 1632. Staindrop Church Mr. Boyle described as one of the most interesting churches in the county, because it still possesses features of pre-Conquest date. Early in the eleventh century King Canute, after a barefooted pilgrimage to the shrine of St. Cuthbert, gave certain territories in south Durham to the church at Durham, and among them was the vill of Staindrop. What were the ecclesiastical arrangements at Staindrop is not known, but there are portions of the church which can scarcely be of later date than the time of Canute. Mr. Boyle described the additions made to the old Saxon church, showing how carefully the builders have preserved the old original work, setting an example to modern "restorers." Mr. Boyle described the Neville monuments in the church, the earliest of which are to the ladies of the Neville family belonging to about 1250, judging by the style of costumes on the effigies. The monument of Ralph, Lord Neville (who died 1314), and his two wives, is one of the most magnificent sepulchral monuments in England; its proper place is the centre of the chancel, but it has been removed in comparatively recent times to make room for an extremely vulgar monument. In another part of the church is a wooden monument to the last Lord Neville and his two wives. It was suggested by Mr. Boyle that these two handsome Neville monuments should have railings around them in order to preserve them from the ill-usage of sightseers.

#### BAYHAM ABBEY.

AN excursion was lately made by the Sussex Archæological Society to Bayham, when the Abbey was visited and described by Mr. St. John Hope, of the Society of Antiquaries. The Abbey is, in its details, one of the best preserved in England. The stone used is from quarries in the neighbourhood, sandstone of the Hastings beds. But it is of great hardness, and has worn so well that the ornaments, capitals, &c., preserved retain a degree of sharp and clear outline which is really wonderful under the circumstances. In one sheltered place even traces of the original colour remain. Though there was, Mr. Hope said, a more or less complete history of the Abbey from its foundation to its fall in 1526, very little could be learned from it touching the history of the buildings. They must, therefore, see what the buildings themselves could tell them. Despite the apparent singularity of plan, the whole of the original setting out of the main building was perfectly normal. They had the cloister placed, as was most usual, on the south of the church which covered its north side, with the other buildings ranged round the east, south, and west sides on the ordinary Benedictine plan which White Canons adopted without any important variation. The architectural history of the church, which was the only building exhibiting any noteworthy changes, was particularly interesting. Although it was originally of the accepted normal type, the existing ground plan was of very remarkable character, and so far as his experience went was quite unique. The statutes of the White Canons ordained that no new house of the Order should be founded unless there were at least twelve clerics (or canons) to colonise it, and unless certain buildings should have been built for their reception, viz. a church, dorter (that is, dormitory), frater, guest-house, and gate-house. As the dorter and frater were invariably buildings on the first floor, this of necessity implied that other apartments, which were always found, viz. the vestry, chapter-house, and warming-house under the dorter, and cellars for stores, &c., under the frater, were also included in the original work. At first the buildings named in the statute were not necessarily of a permanent character, and the rule was considered sufficiently obeyed if temporary erections were set up

to go on with, but after the canons had taken up their abode in the new abbey, they forthwith commenced the construction of their permanent buildings if funds allowed. The order in which they worked was somewhat as follows:—First, they built so much of the church as was absolutely necessary for the services; then the vestry, chapter-house, and warming-house, while the floor above that formed the dormitorium, or dorter; then they built parallel with, but remote from the church, a series of cellars and other offices on the ground, with the refectory, or frater, above; and after these an important group of buildings on the west side of the cloister, known as the cellarium. The abbey kitchen generally stood west of the frater, or adjoined it on the south of its western end; the infirmitorium, or "farmery," usually stood to the east of the cloister, but clear of main buildings, with which it communicated by a passage. The cloister—the centre of everything—was a quadrangular area, which covered alleys on each of its four sides, enclosing a grass plot in the centre.

The extreme measurement of the nave from east to west, including the chancel, is 257 feet, and the height from the ground to the plate-beams of the roof 50 feet, whilst its width is only 24 feet. It is crossed by a transept 86 feet in length, and their intersection was formerly surmounted by a central tower "supported by clustered pillars, highly ornate and elegant." The general character of the architecture is that of the thirteenth century. The apse is trigonal, and resembles that in the Grey Friars or Franciscan monastery in Major Stileman's grounds at Winchelsea. In its present state the abbey ruin consists of the nave of the church, the cloisters, and a portion of the rectory. At the north-eastern end are the remains of a staircase which, passing behind the high altar, went round the interior of the church. Traces of the high altar are still perceptible, and near its site is a stone inscribed thus:—"Ella de Sackville, Doughter of Ralphe de Dene, founded this Priorie in honovr of St. Marie, in the reign of K. Richard ye First. The Grovnd was given bye Syr Richard de Thorneham. The Præmonstratensian Canons of Brockley, with those of Beavliev, were incorporated and placed here, and their charters were confirmed bye Kyng John, K. Henry III., and K. Edw. II. ;

#### TESSERÆ.

##### Marble in Ancient Rome.

A. THOMSON.

IN no respect do the ancient Romans appear to have been more profuse than in the expense they incurred to procure their favourite "marbles," and even at the present day the traveller is astonished by the incredible quantities still to be seen. It has been justly remarked that there is not a door-sole nor a guard-stone at the corner of the meanest court in Rome, which is not of marble or of granite from some ancient edifice. The palaces and churches of modern Rome owe all their ornaments to this taste of the ancients. St. Peter's presents us only with the accumulated importations of imperial Rome, for, if we except a few blocks lately brought from the Alps to restore S. Paolo fuori le Mura, we are satisfied there is not a pillar or a slab to be found which was not brought to Rome betwixt the end of the republic and the building of Constantinople—a period of betwixt 400 and 500 years. In the year 1700 the antiquary Ficoroni personally counted the columns in Rome, and he says he found 8,000 existing entire, and yet these can be but a very small proportion of what once were there. In the public buildings of London, with all its boasted luxury and splendour, we cannot at the moment remember more than four pillars worthy of the name, and they are those erected in the George III. Library at the British Museum. They are of red Scotch granite, cost about 1,000*l.* each, and are very respectable pillars, but they might "hide their diminished heads" if brought into comparison with many of those of Rome. How much wealth was expended, what human sufferings were endured, that Rome might be adorned! The quarries were the "penal settlements" of antiquity.

##### The Word "Picturesque."

R. P. KNIGHT.

No word corresponding to this, or of exactly similar meaning, is to be found in any of the languages of antiquity now extant, nor in any modern tongue, as far as I have been able to discover, except such as have borrowed it from the Italian, in which the earliest authority that I can find for it is that of Redi, one of the original academicians of La Crusca, who flourished towards the end of the sixteenth century. The Spanish does not appear to have received it; at least it is not to be found in the great authorised dictionary of that language, the completest work of the kind that has been hitherto executed, and far exceeding those of the French and Italian academies in every respect. In our own language it has been received into very general use; but, nevertheless, it has no

been considered as perfectly naturalised among us, for Johnson has not admitted it into his dictionary, though he has received the word *pictorial*, as the Spaniards have the word *pictórico*, both of which answer in meaning to the Greek adjective *γραφικός*, except that, in the Greek, the arts of writing, painting, and engraving being expressed by the same verb, any adjective or metaphor taken from it must of course have a more extensive and less determinate signification. The Abbé Winkelman, who understood nothing of the Greek language, translates *γραφικόν*, in a passage of Strabo, picturesque; and Price has received his interpretation without examining it, though as the object to which the epithet relates is an Egyptian temple of plain architecture, of which the geographer merely says that it had *οὐδὲν χαρίεν, οὐδὲ γραφικόν*, it does not afford much either of illustration or confirmation to his hypothesis. Had the German antiquary chanced to stumble upon such an expression as *γραφικὸν πῆθρον*, we cannot doubt from the specimen which we have already had of his learning and sagacity, but he would have translated it picturesque stream, and this would have exactly suited my friend's purpose. Unfortunately, however, had his usual accuracy of research or any suspicions of the infallibility of his guide led him to look at the context, or even to consult his lexicon, he would have found that this sonorous phrase only means ink, more commonly called *μέλαν γραφικόν*. According to the idiom of the Italian language, by which the meaning of all adjectives ending in *esco* is precisely ascertained, *pittoreesco* must mean after the manner of painters; whence we may reasonably infer that painting had at that time appropriated to itself certain descriptions of objects for representation, or had adopted some peculiar mode of representing them different from simple or common imitation, which peculiar mode would naturally give them a peculiar character in the eyes of persons familiar with and skilled in that art.

#### Classicists and Romanticists.

J. P. PROUDHON.

The romantics reproached the established tradition with two things: the first with setting aside fifteen centuries of history, whence the narrowness of its thought, and the want of life and originality and truth in its works; the second with not even understanding its models, and being thereby thrown into endless contradictions. Is the history of Christendom nothing? said they. Is it not as much matter for poetry as the pagan mythology and wars? And if it is artistic material, why are we to confine ourselves to the limits of your classics? And then with your worship of classic form, which is your ideal, you sacrifice expression, which is not less important, and so fall into conventionalism and monotony. The ancients carved their calm gods because they believed in them; we, who seek action and life, common labours and civic duties, cannot accept them as models. The classics argued that art is absolute, universal, and eternal; that its rules, which are the laws of the beautiful, are, like the rules of logic and geometry, immutable; that the ancients practised them because they understood them, and hence left us incomparable works; that there is only one and the same art in which nations more or less succeed; that the revolutions of history do not necessitate revolutions in literature and art, as the Renaissance artists proved; that to abandon a tradition, consecrated by so many masterpieces, would be to retrograde, and substitute the worship of the commonplace for the worship of form; finally, that if the new school thought it could excel the old, it had better try, and would then be judged by its performance.

#### Colour Sense of the Ancients.

M. LUBBOCK.

Mr. Gladstone was struck with the fewness of the colours mentioned by Homer, and the inexact manner in which the colour terms were used, and in 1858 he suggested that colours were probably not appreciated at that day as they are now, the organ of colour and its perceptions being probably in a comparatively undeveloped condition. The next to take up this question was Lazarus Geiger. In a paper read at Frankfort-on-the-Maine in 1867, he represented that the power of perceiving colour, as it now exists, must have been attained gradually and progressively, and that even within historic times. Suggesting that probably the organs of man's senses some thousand years ago were by no means in the same condition as now, and that they were then incapable of their present functions, he applied this idea to the power of distinguishing colours, and examined the indications of colour-perception presented by the works of different ages. Neither in the Vedas, the ancient religious works of the Hindus, which are supposed to have been written from fourteen to sixteen hundred years B.C., nor in the Zendavesta, or books of the Parsees, or Persians, which must have been written before the eighth century B.C., did he find indications of developed colour-perception. From both any mention of blue colour was entirely absent, a fact the more striking since the Vedas are full of descriptions of the sky, while the latter, the Zendavesta,

specially treats of light and fire, which are represented as originating in the sun. Similarly green colour is not mentioned either in the Rigveda hymns or in the Zendavesta, though both often speak of the earth. The size and height of trees are considered, but not the green colour of their leaves. Again, he finds, as Mr. Gladstone did, how inaccurate are Homer's descriptions of colour, and adopts the same suggestion, namely, that colours were probably not perceived at that time as they are now. In 1867 M. Hugo Magnus, in a work entitled *Die Entwicklung des Farbensinnes*, published at Iena, gave reasons for believing in the same progressive appreciation of colours as Geiger; in the same gradually increasing sensibility to colour impressions. Believing that at first mankind merely perceived white and black, the presence or absence of light, he believed red to have been the first true colour to be recognised, and that the power of perceiving the other colours was gradually acquired in the order of the colours in the solar spectrum. Thus he believed the perception of red to be followed by that of yellow, these two colours seemingly having the longest and most powerful waves of ether. The perception of green followed, then of blue, and lastly of violet. Dr. Magnus believed that it was whilst red and black were alone distinguished that the hymns of the Vedas were written, that yellow was also recognised in the time of Homer, and that it was only at a later date that the perception of green followed, and lastly that of blue and violet. He believed it to be only in quite recent times that the numerous shades of the solar spectrum have been defined with exactness, that the evolution of the colour-sense is still incomplete, and that the time will come when the ultra-violet rays will be perceptible to the eye, though their existence is only at present recognised on account of their chemical effects. It has already been pointed out that colour-blindness has been supposed to be a return to the primitive condition of vision in mankind. A further examination, however, shows that, even supposing primitive vision to have been such as Dr. Magnus suggested, this could not be the case. In colour-blindness the perception of red is almost invariably lost, while that of blue and violet is present. The reverse is supposed to have happened when colours were first appreciated by mankind. Red colours are thought to have been perceived, when blue and violet were not yet distinguished. Thus there is no resemblance between colour-blindness and the condition which is supposed by Dr. Magnus to have prevailed when the colour-sense was in a primitive condition, nor can it be looked upon as an indication that such an undeveloped state of the colour-sense ever existed.

#### Roman Architecture.

E. A. FREEMAN.

The architecture of classical Rome is, like the literature of classical Rome, imitative. Italy, the land to which the world practically owes the great discovery of the arched construction, may very likely have had a native architecture, as well as a native literature, in the days of the kings and the early consuls. But the architecture of classical Rome was a mere imitation of that of Greece. It was indeed but an imperfect imitation. The Roman architects were not so besotted as to cast away their own great invention of the arch, and to fall back on the less flexible, less diversified, constructive system of the Greek entablature. But, just as they spread a varnish of Greek forms, Greek metres, and what not, over their native Italian literature, so, in like sort, they spread a varnish of Greek decoration over their native Italian construction. Buildings whose real construction was that of piers and arches were masked with a decorative imitation of the columns and entablature of a Greek portico. But as it was in other things, so it was also in architecture. The true Roman spirit was masked only, and not destroyed, by the fashion of Greek imitation. As that spirit shows itself in the satirists, the historians, and even here and there in the poets themselves, as it stands out more clearly still in the mighty fabric of the Roman Law, so there are classes of Roman building in which the national arched construction stands out, masked but feebly, or not at all, by the varnish of Greek decoration. In an aqueduct or an amphitheatre, Greek features, columns and their entablatures, are either absent altogether or are something so secondary as to have but little share in the general effect. In buildings of this kind the round arch, the main constructive feature, does really stand out as the feature which gives the building its main architectural character. And, as Mr. Petit remarked long ago, the step from buildings of this kind to some of the plainer forms of the later Romanesque is very slight indeed. Some of the great German churches, such for instance as the three great Rhenish minsters of Mainz, Worms, and Speier, where the interior elevations consist of square piers supporting perfectly unadorned round arches, have surely a great deal in common with a Roman aqueduct. In both we see the round-arch construction standing boldly out in its most undisguised form. And buildings of this kind, whether aqueducts, amphitheatres, or churches, which rely almost

wholly on their unadorned constructive elements, may undoubtedly be grand and striking in the highest degree. Still a style of architecture would be narrowly limited in its resources, if it were for ever confined to such elements as these. The massive, unadorned, square pier was suited for many purposes; but there were also many purposes which asked for something more graceful, something which better offered itself for enrichment. There was one feature of the Greek constructive system which the Roman architect could do something more than blindly imitate. There was one feature which he could really adopt, for which he could find a place in his own system as appropriate as that which it had held in the system to which it belonged by birth. The Grecian column was freely employed by the Roman architects, but for a long time, in truth during the whole of the purely Classical period, it was used only in a feeble, hesitating, and inconsistent way. Roman architects built porticoes and colonnades after purely Grecian models, without bringing in any feature of the national constructive system at all. Or columns and entablatures after the Grecian model were attached as a mere decorative mask to buildings really built according to the national mode of construction. At last, in days which we are taught to look upon as days of decline, in days which are looked upon as days of degradation both for literature and for art, the great step was taken which was to give Roman architecture an harmonious and consistent form, the step which was to make its chief decorative feature become also the chief feature of its construction. In the Greek system the column had boldly and honestly supported the entablature. In the Roman system of construction the round arch answered to the entablature. What then was needed to make the column a real feature in the Roman system was to make it discharge in the Roman construction a duty strictly analogous to that which it had discharged in the Greek construction. In the Greek system the entablature had rested on the capitals of the columns; what was now needed was to make the round arch rest on the capitals of the columns also. This simple change at once gave Roman architecture a form both consistent in construction and graceful in decoration. Next to the introduction of the arch itself, no architectural revolution has been so great and so lasting in its results. The man who first boldly set his arch to rest on the capitals of his columns made a change which led the way to all future developments of arched architecture, round and pointed alike.

#### Vitruvius.

C. R. COCKERELL.

The æsthetical principles of architecture, as handed to us from the Greeks by Vitruvius, concur with the notions of ancient philosophy, and have not been controverted by the modern; and though subjected of late years to some rude attacks, they have never been superseded, and we can follow no better text-book in the consideration of our subject. Those principles apply to every style and invention of architecture which the world has hitherto known; they belong to our physical and intellectual nature, and will never change but with an alteration in these. When the works of Vitruvius were first discovered, they were accounted a revelation to the craft, and called "divine" by Sulpitius, the first translator; and, nearly 200 years after, Perrault, in his translation, calls them "a very singular piece, and an inestimable treasure in the opinion of the learned." Eighteen translations, in forty-one editions, are enumerated to this day. In 1807 the philologist Schneider republished Vitruvius. "My whole scope," says he, "has been to purify the text, so as to enable men learned in art to reconstruct and understand the theories of Vitruvius, hitherto obscured by interpolations and vicious translations." But he detracts from the merit of his work by a severity of criticism as uncandid as it is derogatory to the character of his author. He declines his apology, as "writing neither as an accomplished philosopher, an eloquent rhetorician, nor as an expert grammarian, but as an architect, laying down rules useful to those who build." He calls his language obsolete and plebeian, accuses him of pride and envy, and rates him as a morose, inept, infirm old man, querulous, and vulgar. But Schneider was the less justified in such treatment, as being weak upon those points in which his author was most strong, for he says:—"On architectural subjects, or that which has to do with the subtleties of the art, and the questions and disputes concerning them, I neither could nor would have anything to say." So that the science has received no direct advantage from the labours of Schneider, and yet how much was to be done might be understood by ten discoveries in confirmation of the theories of Vitruvius made within a few years. The slanders of Schneider had been adopted in this country with little honour to the parties, and no advantage to architecture. Vitruvius remained the father of our art, and was entitled to our respect as the text-book of our studies. Having been appointed surveyor to the warlike engines and stores of the empire by Augustus, Vitruvius was endowed with leisure, and very probably was instructed to collate the Greek authors on our

art, whom he enumerates, and who were collected and deposited in the magnificent library instituted at that period. He appears, then, with singular advantage as transmitting the well-digested and received principles of the greatest masters who had thought and written on architecture to modern times, and the principles thus derived directly from the Greeks merit our closest attention.

#### Technical Note Books.

H. CONYBEARE.

The power of analysis and methodic arrangement, which your previous mathematical training has been intended to confer, can alone enable you to master, in so short a time, even a general knowledge of so wide a field as the practice of civil engineering presents; and it is desirable that you should be most strongly impressed with the paramount importance of keeping note books and taking notes of every engineering work you read and every engineering fact you observe. Such notes should be as succinct and synoptical as possible, so as to occupy a minimum of space and time. It is impossible to overrate the importance of such a system of record—nothing fixes facts or formulæ so firmly in the memory as writing them out, and nothing clears the brain of the writer so efficiently as the mental manipulation essential in arranging his facts in their proper order of sequence, and putting them into the smallest number of words possible. Your note books should afford a permanent, succinct and classified index of your reading—a *catalogue raisonné* of the engineering facts and results you have possessed yourselves of, either by study or personal observation. In each note you should always refer intelligibly to your authorities, in order that, if ever actually engaged on the particular description of work to which it refers, you may be able to read up your authorities over again. George III. used to say that "he did not believe his lawyers knew more law than other people, but they knew where to find it."

#### Elasticity of Wrought-iron.

Z. COLBURN.

It is commonly held that, within certain limits of strain, iron is perfectly elastic. No matter how often it may be stretched or deflected, up to a certain point, the general belief is that it will come back to its original form every time the load is taken off. There are high authorities, however, who maintain that iron takes a permanent set under even very moderate strains. If we are to understand that the set is exceedingly small, this may be true. The late Mr. Hodgkinson, for example, remarked (on the 381st page of his "Experimental Researches") that two cast-iron beams took each a permanent set with weights respectively equal to 1.57th and 1.80th of the breaking weight. In a discussion at the Institution of Civil Engineers, a Mr. Dines mentioned that he had tested upwards of 8,000 cast-iron girders for the late Thomas Cubitt, and that he found it hardly possible to apply a weight so small as not to produce some permanent set, 1.20th of the breaking weight producing a perceptible set. In the experiments of the Iron Commission at Portsmouth, a bar of annealed wrought-iron 50 feet long was said to have taken a perceptible set with a weight of less than  $1\frac{1}{4}$  tons per square inch. After this weight had been doubled, however, the set was still only perceptible; and notwithstanding that the elasticity of annealed iron is known to be inferior to that of unannealed bars, the whole set of the 50 feet bar was but the  $\frac{1}{100}$ th part of 1 inch, after a strain of  $8\frac{1}{2}$  tons per square inch had been borne, and the set was but the  $\frac{1}{10}$ th of an inch in 50 feet after a strain of 11.9 tons per square inch. Mr. Edwin Clark has experimented on a wrought-iron bar 10 feet long and 1 inch square. Under a strain of 3 tons per square inch he gives a permanent set of nearly the  $\frac{1}{400}$ th part of an inch in 10 feet. With 8 tons the permanent set is given as about the  $\frac{1}{100}$ th of an inch in 10 feet; and it was not until a strain of 13 tons per square inch had been applied that a set of  $\frac{1}{32}$  inches in 10 feet became apparent. With such exceedingly minute measurements we may, perhaps, doubt if there was really any permanent set at all, with strains under 9 or 10 tons per square inch. An increase of temperature in the bar of perhaps a single degree while the measurements were being made, even under considerable account for some of the reported sets, made under considerable strains. Thus Mr. Edwin Clark gives the permanent set of his bar, after a strain of 8 tons per square inch, as the  $\frac{1}{10000}$ th part of its length, and this is almost exactly what the extension of the bar would have been had its temperature been raised but a single degree between the observations. Iron is heated in the very act of straining it, and a sudden breaking strain will generally leave the broken ends too hot to be handled. Such a slight apparent extension might also have occurred while the shackles by which the bar was strained were coming to their bearings. But even if such a microscopic permanent set really existed, it is one of which no engineer would take the slightest serious notice as affecting the strength of the bar in which it was observed.

## NOTES AND COMMENTS.

THE varieties of the knowledge possessed by SHAKESPEARE have given rise to many essays by specialists. Lord CAMPBELL summed up in favour of the theory that the player was a hanger-on of the law; Dr. WORDSWORTH has discoursed on the orthodoxy of his theology; Dr. PATTERSON testified to his acquaintance with botany and other branches of natural history, and so on. Mr. STOPES, the author of a book on "breweries and malthouses, which we once reviewed, now demonstrates in an essay that SHAKESPEARE knew as much about strong drink as is possible for a consumer. Like HOGARTH, and the poet of the libretto of the opera of "Marta," he believed in the virtues of native beer above all importations. But from the extracts which are given in the essay, SHAKESPEARE apparently was not initiated into the mysteries of brewing and of the adulteration of liquors to suit the palate. This is remarkable, as there is good reason for supposing that SHAKESPEARE was connected with brewing as well as with other unpoetic but money-making trades. BACON also writes about thin and thick potations as a man who was allowed to see the operations of their production, and who tried to form a theory on the subject. In the plays we see evidence that the writer could recognise that beer and wine may be abused, while in BACON there is a more philosophic spirit, as if drunkenness would become to him a subject of study quite as interesting as the gladdening of heart which follows measured libations. It is therefore not unreasonable to conclude from the difference which is seen in the manner of considering drink in BACON's works and in the plays, that the same mind could not have produced them all. But, on the other hand, if SHAKESPEARE knew more or less about malt tubs and stills, why does he write as if he were only a tavern frequenter or a guest in hospitable houses? The writer of the plays was able to utilise scraps of knowledge of all kinds, and why could he not find sermons in malt and grapes as well as in stones? We cannot believe that BACON was a poet, much less a dramatist, and Mr. STOPES's book will help to demolish the new theory; but, contrary to the intention of the author, we believe it will also aid in dispelling the superstition about the butcher's son of Stratford. If, out of compliment to a firm of brewers in Stratford-on-Avon, Mr. STOPES is ready to believe that SHAKESPEARE was a brewer, why is no proof of his calling to be found in play or poem?

THE representatives of Uruguay sought designs for their pavilion in the Paris Exhibition from French architects. The design by M. BARRÉ, of Paris, has been accepted, and he is entrusted with the execution of the building. M. DEBRV, of Amiens, obtained the second prize, M. BRIEN the third, and M. LAIR the fourth prize.

IT is to be regretted that JAMES WYLD, of Charing Cross, is no longer among geographers, in order to point out that the scheme for constructing a colossal globe in the Champ de Mars is no more than a repetition of the experiment in Leicester Square at the time of the Great International Exhibition, when Mr. WYLD was aided by Mr. H. R. ABRAHAM'S skill as an architect. The students of geography had the advantage of contemplating the world from the inside, which was novel, but in Paris there will be no departure from the scholastic use of the globes, except that punishments for not enjoying a dreary study will not be awarded.

THE Belgian Government have now an opportunity of remodelling the Museum of the Porte de Hal, Brussels, and thereby to make the rooms worthy of the country. Hitherto the obstacle to improvement was said to be the conservatism of the curator, M. JUSTE, who held to his own ideas about the uses of a museum. The old fort containing the collections is, as everybody knows, fairly well adapted for holding archaeological objects, although the light may occasionally be insufficient. The Bishop's Palace, which forms a part of the Glasgow Exhibition, might have been suggested by the Porte de Hal. Among the wood-carving, pottery, glasswork, church furniture, armour, &c., in the Brussels Museum, many pieces of great interest can

be found, but it is difficult to realise that any system was adopted in arranging them, and the patience of the archaeologist is in consequence soon overcome. He finds himself wandering about like the ordinary sightseer, and when he leaves the hall he has not found the object he sought. What is needed in Brussels is a curator who can put himself in the place of an archaeologist who is a stranger and who has not time to spare. For his requirements there must be a proper classification of the objects in a museum, and he will need no other clue. There are men enough in Belgium who are competent for the office of conservator, and the best among them should be selected, for HERCULES himself might hesitate before the work that must be undertaken for the transformation of the museum. Advantage might be taken of the opportunity for another purpose. Would it not be well to have a meeting of the curators of archaeological museums at the Musée Royal d'Antiquités et d'Armures, for the purpose of making some approach towards a uniform system of arrangement in the museums of Europe?

IT is satisfactory to find that in most of the French competitions for memorials an architect co-operates with the sculptor, and has an equal share in the success whenever the design happens to be accepted. The latest instance of the kind is the memorial of the Girondists which is to be erected in Bordeaux. The first prize was obtained by the design produced by M. LABATUT, the sculptor, and M. ESQUIÉ, the architect, and the second prize was awarded to a design by M. DUMILÂ, the sculptor, and M. DEVERIN, architect. The accepted design will probably cost 200,000 francs to realise, and the memorial will be erected in one of the most attractive places in Bordeaux, the Allées de Tourny. The design consists of a sort of Corinthian-Byzantine column, surmounted by a figure representing the French Republic, which is accompanied by a lion. The pedestal will be adorned by sculptured groups representing scenes in the memorable history of the Girondist party during the first revolution.

IT may be safely asserted that few tourists who in the course of their round through Paris visit the Place de la Bastille are aware that the outline of the ancient prison is marked by an arrangement of the paving stones and flags. There is no respect for history shown by the great waggons and vehicles which pass throughout the day over the Place, and in consequence the distinction of the lines is almost abraded. It would not answer if the crowds who will visit Paris next year were unable to trace the site of the Bastille, although a good reproduction of the building may form a part of the Exhibition. Orders have been given to have the paving overhauled, and, as the work is not of great magnitude, there will be no difficulty in restoring the lines.

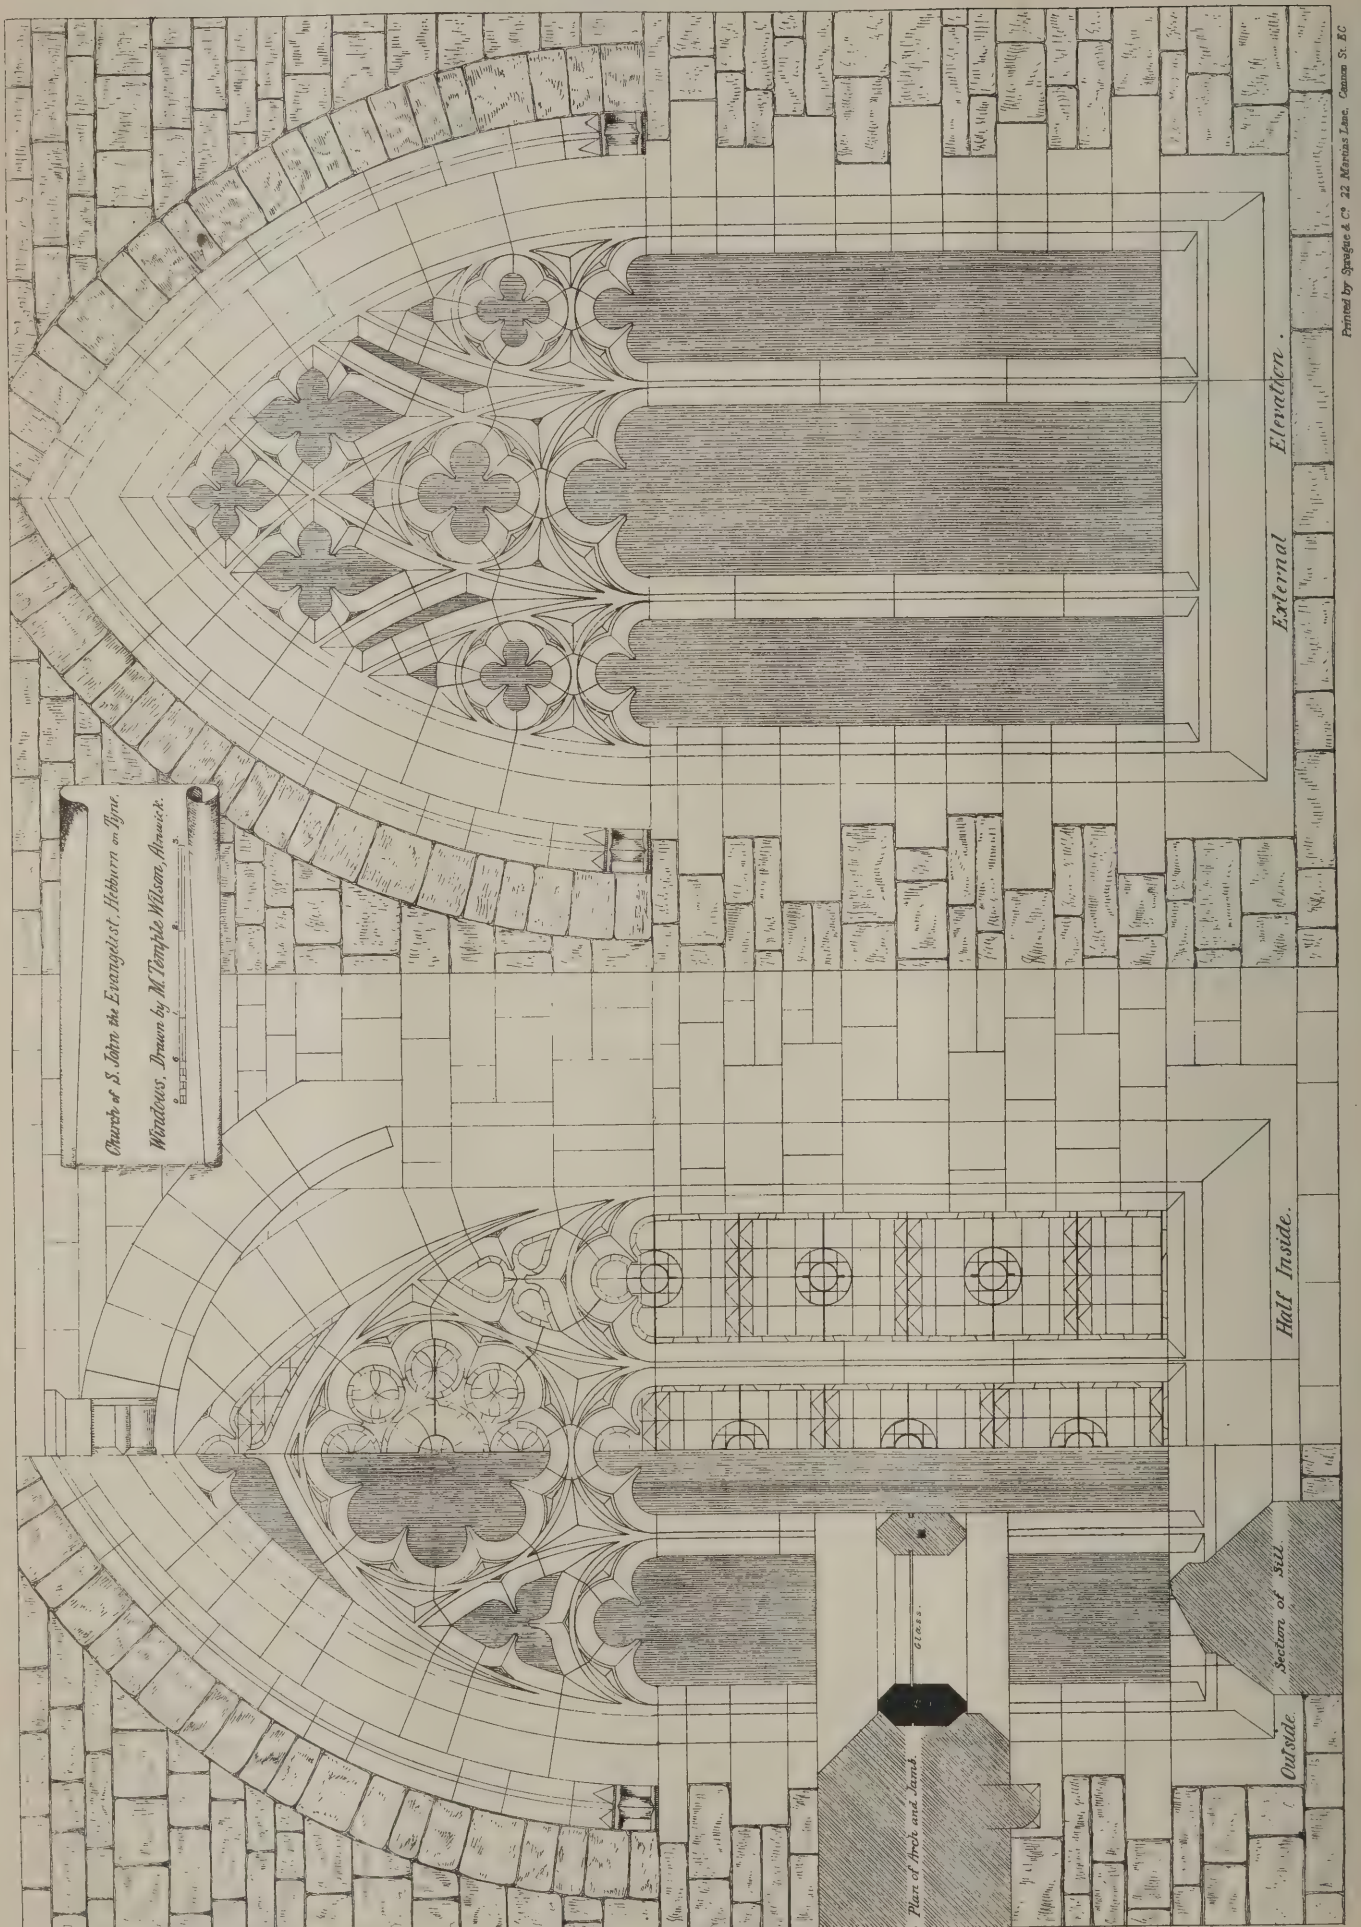

THE chair of Associate Member of the Royal Academy of Antwerp, which was vacant through the death of M. QUESTEL, the architect, is now occupied, as M. HENRI RÉVOIL has been elected. He is among the best known of French architects, and has written some valuable works on his art, especially one on Roman architecture in the south of France. The Antwerp Academy consists of only twenty-five members, and the foreign members cannot be more than ten in number. It was anciently a guild under the patronage of St. LUKE, and was liberally endowed by PHILIP IV. of Spain.

THE furniture of the sheds on the site of the Tuileries having been sold, the sheds themselves will be put up for sale to-morrow. An immediate demolition of them being stipulated, there will be shortly no trace of the temporary post-office which spoiled one of the best parts of Paris. Something will have to be done with the site, as the erection of the contemplated monument of the Republic will need years instead of months. There is no question that the disposition of the place is a most difficult problem. The Arc du Carrousel should be the end of the vista which begins with the Arc de Triomphe in the Champs Elysées, and a great mass of stone placed in front of the former must be an impediment which admirers of the amenity of the city cannot fail to dislike.

FIR GROVE, WEYBRIDGE.

THE arrangement of this house can be deduced from the two plans and views. The hall, which is about 14 feet square, gives access to the three principal rooms. On the ground floor the earth-closets are placed in a way that can offer no inconvenience. In addition to the four bedrooms there are two well-lighted attics. The architect was Mr. HENRY CURZON, 61 Lincoln's Inn Fields, London.

WINDOWS, ST. JOHN, HEBBURN-ON-TYNE.

AN account of the church of St. John the Evangelist, Hebburn, was given lately in this journal. We now give drawings of two of the windows, and more details of the work will be supplied in a subsequent number.

THE CHAPEL, STONYHURST. INTERIOR VIEW.

THIS chapel is being built for the boys, and replaces the present one, which will be utilised as an addition to the libraries. In plan the chapel is rectangular, 90 feet by 35 feet. On one side, under the windows, are confessionals and a sacristy, and on the other tribunes, raised about 12 feet. The latter have fronts of oak screenwork, corbelled out from the face of the wall. A carved dado, of oak, runs round the walls up to the string-course below the windows, which occupy almost the entire wall space on one side of the chapel. The roof is also of oak, of hammer-beam construction, but having the space between the window arches and the hammer-beams filled with fan-tracery groining, surmounted by a carved cornice and cresting. The reredos will also be of oak, with spaces for pictures, and having the top brought forward with fan-groining, corresponding somewhat with that of the roof. This building is part of the new college designed by Messrs. DUNN, HANSOM & DUNN, architects, of Newcastle-on-Tyne.

THE BRITISH ARCHÆOLOGICAL  
ASSOCIATION.

THE annual Congress of this Association opened in Glasgow on Monday, when the members and visitors were received in the City Chambers. The Lord Provost, in welcoming the party, expressed his pleasure that so many had found it convenient and agreeable to pay a visit to so ancient a city. When he spoke of its ancient character he was afraid that the relics of antiquity were but few in number; but their programme included visits to prehistoric forts, to the Roman wall of Antonine, and to the Roman camp of Ardoch, also to the interesting antiquities of Bute, where they would have the opportunity of enjoying the hospitality of the Marquis; the two battlefields of Bannockburn and Langside, the palaces of Stirling and of Linlithgow, the castles of Bothwell and of Craignethan; and last, the members would find in the grounds of the Exhibition a collection of the rarest and most valuable treasures of an antiquarian character, many of which have never been shown before.

Sheriff Berry said he could add little to the remarks made by the Lord Provost. No doubt the present city did not externally bear many marks of antiquity. It had grown to be a great mart of trade and manufacture; but still in its early history it was well known that for a long period Glasgow was simply the burgh of the Bishop or Archbishop of Glasgow. They were to have from Mr. Honeyman, a master on the subject, an explanation of the architecture of the cathedral, which carried them back to the early history of this city. They were also to have a paper on the history of the see from the Archbishop of Glasgow, and that could not fail to throw a great light upon the early history of the city.

Mr. John Honeyman, as president of the Archæological Society of Glasgow, said he had to offer them on behalf of the Society he represented a most cordial welcome to Glasgow. The Lord Provost and the learned Sheriff had spoken more exclusively on behalf of Glasgow, but his Society included a somewhat wider area. He was glad to think that so many

members had volunteered to assist them on the present occasion, to read papers on the various places of interest which were to be visited outside the boundaries of the city. He need hardly say that the visit of the British Archæological Association to that part of the country had been matter of great interest to the members of the Glasgow Society. They were all sensible of what must be the feelings of archæologists, that one of the needs of the present time was a closer association of the various societies.

Mr. Morgan, hon. treasurer of the Association, in the absence of the president, the Marquis of Bute, thanked the Lord Provost and the other gentlemen for the kindly reception they had given the Association on its first visit to Glasgow.

The party then proceeded to the Park Buildings, Langside, where Mr. A. M. Scott detailed the incidents of the battle fought by Mary, Queen of Scots, on May 13, 1568, against the Regent.

Proceeding to the memorial below the park, and at the entrance to the village of Langside, the ceremony of inauguration was gone through. The cathedral was next visited, where Mr. John Honeyman, F.S.A. Scot., read a paper on the history and architectural features of the building, which will be found in another part of our issue. A public dinner at the Grand Hotel, Charing Cross, finished the day's proceedings, the Sheriff of Lanarkshire, Dr. Robert Berry, and a vice-president of the meeting, being in the chair.

After the usual loyal toasts, the Chairman gave the toast, "The British Archæological Association." In the cathedral, he said, Glasgow possessed a building of which the citizens might well be proud. They in Glasgow were glad to think that the spirit of their ancestors was such as to prevent the demolition of that cathedral when, unfortunately, too many ecclesiastical ornaments in Scotland were destroyed. It was not the only cathedral which Scotland possessed in a practically intact condition. He was fortunate enough the other day to visit the cathedral of St. Magnus in Kirkwall—a building, he believed, still more ancient than the cathedral of this city, but one, he was afraid, rather too remote for the Association to visit. They had in Glasgow a building which antiquarians would delight to visit, and which the citizens naturally prized as a great feature of this city. Apart from the cathedral itself, the history of the city was also worthy of the study of antiquarians. The history of the city, or rather burgh, as it was for a number of centuries, dated from about the date of the cathedral itself, which was, he thought, about the end of the twelfth century, in which the first charter was given to the Bishop of Glasgow. Without wearying them with a history of the city, he just wished to say that for nearly 400 years the burgh of Glasgow flourished under the bishops and archbishops, and it was to the fostering care of those high dignitaries that this burgh, or ultimately city, owed its first beginning of success and prosperity.

Mr. Thomas Morgan, F.S.A., briefly replied.

Mr. Arthur Cates gave "The City of Glasgow." He considered Glasgow was justly entitled to the name of the second city of the empire. They had there the great cathedral, happily preserved, and the great university from which so many students issued forth to make Scotland's name respected throughout the world. These two buildings, representing the Church and religion of the country and its progress and learning, were two of the greatest monuments of this great city. Then Glasgow had the two tallest chimneys in the world, and every one of them looked on these great chimney-stalks with admiration and respect, as emblems of the great power and might of the men who had raised them, and as typical of the great power and wealth of this nation. Perhaps the greatest monument that the city possessed, if it could be called a monument which was ever flowing on, was that which had been practically created by the city, and which had created the city in return—he referred to the river Clyde. He would recommend all who had the opportunity to walk along its quays and its docks, to take boat and look at its great shipbuilding yards, and to consider what energy, what perseverance, what might of mind and of money had been required to convert the Clyde of the past—that stream which in the memory of man had been forded at the Broomielaw—into the mighty waterway for commerce which it now was. It was not simply a glory to Scotland—it was a glory to the whole nation that under such disadvantages a port should have been created which had exercised so much influence on the commerce and wealth of the empire. Of all the cities in the empire he knew none in which architecture had been cultivated with so much care and practised so successfully as in Glasgow. The streets were broad and magnificent; and if they had the tallest chimneys in the world he thought they had also the longest streets, and therefore were distinguished in two particulars. They had also some of the finest buildings, admirably placed and admirably built. If he might refer to one example, he might say that the church in the north-west suburbs, treated in the Roman style of architecture, appeared to him to be one of the best in its arrangements and its execution of any Classic period. Then recently the post-office had been erected in the centre of the city, facing

the square in which it was no doubt the aspiration of many of Glasgow's citizens some day to hold a place in marble or in bronze, and where the great Wizard of the North took his stand, and worthily ennobled it, because to them in the South he was the discoverer of Scotland. It was he who bade them go North, and who gave them the greatest interest in every loch and every castle throughout the country; and to him Glasgow owed much, because if their presence there was worth something it was he who had brought them there. Then the municipality had distinguished itself by erecting a grand municipal block, a block reflecting credit on the city and on the architect.

Sir James King, having replied, other toasts were given to the local executive and the chairman.

#### ST. MARY'S, STRATFORD-ON-AVON.

AN excursion was made by the Worcester Diocesan Architectural and Archaeological Society on Friday to Stratford-on-Avon. Amongst other buildings the church was visited, where Mr. Oliver read a short paper on the history of the building, and was followed by Alderman Noake, who stated that the work of restoration at present accomplished there included the entire repair of the external fabric, which had been carefully carried out on the lines laid down by the Society for the Protection of Ancient Buildings, also the removal of the galleries, rearrangement of the seating, the strengthening of the tower by iron ties, and adding new bells. The next work to be done was the opening of the transepts and removal of the organ to a situation not yet decided on. There had been a delay in the work of restoration which was unaccountable, for with such immense sums as were supplied by visitors from all parts of the world, there ought to be no difficulty in carrying on that work even without any appeal to the inhabitants of Stratford or the public at large. In the Middle Ages the pilgrims to the shrine of St. Wulstan enabled the prior and monks of Worcester to rebuild, enlarge, and repair their venerable cathedral, and so to hand it down to all succeeding ages, and why should this not be the case at Stratford, where the receipts from visitors would seem to be far in excess of what was required for the restoration of a comparatively small church?

#### SANITATION OF TOWNS.

AT the meeting of the Association of Public Sanitary Inspectors of Great Britain, at Brighton, on Friday, Dr. B. W. Richardson read a paper by the president, Mr. Edwin Chadwick, C.B., dealing with the progress of sanitation and the results. In the course of his address he said:—Examining the reports sent to me of the work done in a number of towns, and comparing them with each other, looking particularly at the work done by the sanitary inspectors under the direction of the health officers, as to the number of houses in a bad sanitary condition which have been improved under their direction, and as to the accumulations of putrefying matter which they have removed, it is certain that a large share of the reduced death-rate is due to their service—imperfectly as it is yet organised and obstructed as it still is. Looking, however, at the extraordinary recent reduction of the death-rate in the metropolis (where it was not long since 24 in 1,000, but has recently come down to 14 and 15 in 1,000), I cannot but consider that much of that reduction must be due to climatorial causes. On the occurrence of a great thunderstorm, immediately after it has cleared away there is an experience of a new and fresh atmosphere. It has done for a time what must be the constant work of good sanitation.

Good sanitation will, however, do more than that permanently. By the Consolidated Metropolitan Sanitary Commission—which had charge of the whole of the house drainage, as well as the drainage of the roads, and also of the land drainage of the suburbs, plans based upon trial works of blocks of buildings, which trial has since been verified by the results of work in a number of towns where the system of "circulation *v.* stagnation" is followed—constant supplies of pure spring water would by this time have been carried into every house, or on to every flat in every house without cisternage and stagnation and de-aeration. The foul water would have been constantly carried out of every house by self-cleansing house-drains and sinks into the self-cleansing sewers of the streets, and from those self-cleansing sewers on to the sewage farms or gardens fresh, and without loss of strength by putrefaction. What would have been the grand result of this system is indicated in towns more or less completely on the separate system, for in those towns there is a reduction of the death-rates by fully one-half. And there can be no reasonable doubt that all of the like reductions might have been effected on the same principle in the metropolis and in other cities. It is too

long a story to describe the combination of sinister interests in expensive Parliamentary procedure and in expensive works by which the Government were put in a minority against the continuance of the first General Board of Health and of the Metropolitan Sanitary Commission. By that first General Board of Health local authorities and executive officers were distinctly warned that they were responsible under the old common law categories for acts of "nonfeasance," of "misfeasance," and of "malfeasance."

If an architect or a contractor supplied with a good plan, and with the latest improvements before him, were from *mala praxis* to construct an edifice with a large stagnant cesspit beneath productive of disease to the occupants, he would certainly be liable in damage for his malfeasance, and it admits of clear proof, from what has been done in various other towns, that, had the works on the plans prepared been fairly in the metropolis executed, the metropolitan death-rate would at this present time be reduced by at least 5 in 1,000, and would probably have stood at 12 in 1,000 from the year 1856. Instead of being in its condition, the river would have been purified first instead of last, and the river itself would be pure instead of being in a condition which Lord Bramwell's Commission described as "a disgrace to the metropolis and to civilisation." It appears to me to be of importance at this time to display, in the way of warning, the wholly unimagined and gigantic extent of evil of sanitary "malfeasance" in the results on the metropolis, the cost in lives, and of the money value in lives chargeable and inflicted on the metropolis *mala praxis*, and by "malfeasance." As to the value of the lives, I take the estimate of Dr. Farr in relation to the average actual cost and the average actual value of every human being in England at 159 $\frac{1}{2}$ l. The total loss of lives every day has been 98, and the loss of them in money value has been every day 15,523 $\frac{1}{2}$ l. Every week the average total loss of lives has been 685, and the total loss in money 108,963 $\frac{1}{2}$ l. Every year the total loss of lives in the metropolis has been 35,636, and in money 5,666,059 $\frac{1}{2}$ l. Such will be found to be the rate of the cost of the delay of the practical application of the power of sanitary science in competent hands for the future.

I submitted these results to Lord Herschell as charges for investigation under the Commission for the examination of the working of the vestralised Metropolitan Board of Works. No doubt the discrimination of cases would have been difficult between the individuals who were, we must assume, utterly unconscious of what they were being made to do, and those who were not, or who, in ignorance of the *mala praxis*, nevertheless could not now equitably be subjected in such penalties as would have befallen them from the judges of old. No doubt also the investigation would have been laborious and difficult, yet it would have been useful for the public instruction and for the future warning to local administrative authorities. But as the proved acts of malfeasance in comparatively small matters have served in the mind of Parliament, as well as of the public, for the discontinuance of vestralised authority in such matters, it seems to have been considered unnecessary to enter into the examination of such large and complicated inquiries. It is nevertheless of vital importance that the powers of the great factors of sanitation should be vindicated and shown to be so certain, from what has been done, that a capitalist would be safe from proof of a reduction by one-half of a death-rate in contrast with a reduction of one-third. A contractor, with enlarged and commensurate powers, might contract for the reduction of the excessive death-rate of Manchester—now 27—to 16 in 1,000. And this reduction would be attended, as shown in the manufacturing town of Leek, with an augmentation of five years of the average duration of life and working ability. And at what cost? At not above one-third of the insurance charges of the 24 millions of money annually paid by the wage classes of England to provide against excessive sickness and premature mortality; nay, I believe at not above one-third of the insurance charges against sickness and mortality enforced by a special executive machinery made by Prince Bismarck in Germany.

The sanitary works of drainage and improved water carriage are, however, sometimes countervailed by overcrowding. Let us look at the case of the working-man under that condition. In some experiences got out at Glasgow, it is there shown that there is an excessive death-rate in single-roomed tenements, but a lower death-rate in double-roomed tenements, and a still lower death-rate in the three-roomed tenements. Increased living-room space must be paid for, and is it not worth while for the mechanic who is getting his 25s. a week to pay 2s. or 3s. a week more for such space as he may get in a model dwelling, in which it is proved that on an average he obtains full ten years more of life and working ability? Compare this with the fate of a man who emigrates to a city in the United States, or to one of the Australian colonies, where the death-rate is 27 in 1,000, and who will lose by one-third his chances of life and working ability, and, if he have a family, will see one-half of his children in their graves by their fifth year. I deem the greatest gain of sanitary science developed

since we last met here the proofs obtained of the power of the prevention of the chief of the children's diseases. In the large district schools, the districts of the Poor Law unions, the children's chief diseases are now practically abolished. Those institutions may be said to be children's hospitals, in which children, orphans of the lowest type from the slums, are taken in large proportion with developed diseases upon them, often only to die from constitutional failure alone. Yet in a number of these separate schools there are now no deaths from measles, whooping-cough, typhus, scarlatina, or diphtheria. The general death-rate is about 10 in 1,000, and of those who are not in the probationary wards, of those who come in without developed disease upon them, the death-rates are now less than three in 1,000, or less than one-third of the death-rates prevalent among the children of the general population of the same ages. To illustrate this progress of the chief rudimentary and sanitary factors, I may give one example of an institution where the old death-rate was the common outside one of 12 in 1,000. The institution was first properly drained, and the premises cleared of foul sewage smells, by which clearance the death-rate was reduced by more than one-third, or to 8 in 1,000.

Since last we met there have been, as it appears to me, most important advances in the improvement of ventilation. In some district institutions stoves have been introduced which bring in constant supplies of fresh air, warm it, circulate it, and carry out the vitiated air. Dr. Richardson in his own large library has used one, a calorigen, which introduces fresh air, warms it, and constantly discharges the vitiated air, keeping the room all over at the temperature he requires. Sir Spencer Wells informs me that he uses one for each bedroom. In one hospital some forty are used. But Dr. Bond, the eminent inventive health officer of Gloucester, has invented one; to which the Sanitary Institute has given a prize, as for a very material improvement, and now comes out another adapted to large edifices, used and approved by General Webber and worked by Mr. Green, the material part of which was invented by Mr. Maxim, the great American inventor of the new army gun. I have had the working of this stove examined at the new Courts of Justice, and it is reported to be completely satisfactory, and also on shipboard at the German Lloyd's. It appears to be well adapted for the large schools, where the states of the atmosphere are denoted by the fact that the death rates among the teachers are fourfold those of the Royal Navy on the home stations.

There is yet another great promise of sanitation, of the abolition of foul soot, and sooty fogs, and the reduction of the clothes-washing bill of the metropolis, which I estimated twenty years ago at 6,000,000*l.* At Pittsburg, New York, the steam power is worked by gas. In Manchester the working of steam-engines by gas is now offered at two-thirds of the price of working them by the wild flame of coal, and, when the municipality has charge of the gasworks, they may supply the houses with the internal apparatus and heating power at a rent cheaper than warming by coal. There is also promise of the extensive distribution of power by electricity. Experiments recently made at Oerlikon, near Zurich, have demonstrated the possibility of distributing power economically by means of electricity. The power of a water-wheel at Kriegstettin has been delivered at Solothurn, distant about 75 miles, and the net power delivered amounts to 75 per cent. of the power supplied by the water-wheel. I must conclude my too long survey of what I consider to be the chief advances in sanitation since the last congress held here, with thanks for your attention to them.

### SCOTTISH BROCHS.

THE following description on the subject of Scottish brochs is from a correspondent of the *Glasgow Herald*:—"These structures are invariably round in form. One cannot examine many of them without being struck with the remarkable similarity of plan which shows itself amid occasional slight differences. Externally the structure presents the appearance of a truncated cone having no windows looking to the outside, the only opening being a doorway, which gives access through a passage to the central chamber. There are, as a rule, two concentric walls distant a few feet from one another at the level of the ground, and usually sloping towards each other so as to meet at the top. In some instances, however, the two walls form one solid mass for at least a part of their height. Dr. Wilson, in his 'Prehistoric Annals of Scotland,' thus describes the arrangements in the space between the walls. Within this space 'a rude staircase, or rather inclined passage, communicates round the whole, and a series of chambers or tiers of interspaces, formed by means of long stones laid across from wall to wall, so as to form flooring and ceiling, are lighted by square apertures looking into the interior area.'

There is scarcely any doubt that this central area was open to the sky. Had it not been so, the square openings just referred to would have been useless, since in no other way

could light be admitted into the galleries in the wall. In Sardinia there is a class of very ancient structures resembling in some respects the Scottish broch, though in other respects differing from it. These are the nuraghes, of which there are said to be three thousand on the island, chiefly in the inland parts. The nuraghe, like the broch, is circular, and has, like it, a central chamber and a staircase, but the resemblance ends here. The special feature about the broch which distinguishes it from the nuraghe is the presence of the wall chamber, to which access is had from the central court, and also from the passage leading to it. These chambers occupy spaces in the thickness of the wall, several of them being found in each broch. They commonly vary, however, in number and dimensions in different structures. These chambers are roofed in the so-called bee-hive manner, *i.e.*, the horizontal courses of stone forming the sides of the chamber are each made to project slightly beyond the course below, so that the four sides gradually approach one another near enough to allow the space at the top to be covered by one or more flagstones.

Brochs are, as a rule, surrounded by various other structures, usually at a distance of several yards, though both the distance and the character of the structures vary in different examples. These outworks generally consist of masses of masonry enclosing passages and chambers, while a solid wall in the form of a rampart occasionally surrounds the broch. There is reason to believe, however, that all such outworks belong to a secondary occupation of the site, and have a date considerably posterior to that of the brochs themselves. The same may be said of erections which are often found inside the main building, in the form of a wall, usually about 8 feet high, running round the face of the inner wall, with or without stone partitions built across the central area. These additions were probably made by later occupants as part of a plan to cover over the court as a place of shelter from the weather.

A feature of note about these towers is the absence of mortar in their construction. This is an invariable characteristic. Mud or moss may have been used to fill up crevices between the stones, but certainly no trace of cement has ever been discovered. After the excavation of the broch of Carn Liath, near Dunrobin Castle, in Sutherland, a year or two ago, some mortar was used to prevent the further ruin of a wall—a circumstance which may puzzle antiquaries a few centuries hence. Oldwick Castle, an ancient keep overlooking the Bay of Wick, may in some respects, notably in having chambers in the thickness of the wall, be compared with the broch; but the presence of the mortar in its construction shows that it belongs to a later civilisation. Since cement was unknown to the broch-builders, it followed that to produce strength recourse had to be had to great thickness of wall. A thickness of about 14 feet is frequently to be met with, but in different examples the wall varies in this respect from 9 feet to 20 feet. The central court also varies considerably in diameter, 33 feet being a usual measurement. In several brochs a well with steps leading down to it has been found within this central area. In some instances these wells were dry at the time when the broch was freed from rubbish, but more than once water has been found in them.

In Kettleburn broch, in Caithness, explored by the late Mr. Rhind, a spring of clear water was discovered, which is still used by the cottars in the neighbourhood, whose houses have been built from stones taken from the broch. Time, aided by man, has done much to demolish these ancient structures. In some cases they have become so ruined as to appear in the form of green mounds, with merely a stone projecting here and there. Indeed, the very memory of them has sometimes perished, and their existence has been only revealed by the ploughshares, as in the case of the broch at Hunton, in Orkney, which was entirely concealed beneath the level of a cultivated field. The dun of Carloway, in the Island of Lewis, situated about eight miles from the famous standing stones of Callernish, remains, in part at least, tolerably well preserved. In Glenelg, opposite to the Island of Skye, there were formerly four brochs, built, according to a local tradition, by a mother for her four sons, who were named respectively Malcomb, Chonil, Telve, and Troddan, the towers being called after them. Of these brochs the first two were almost entirely demolished before the beginning of last century, but the other two still show a good part of their original height. In 1720, when Gordon visited Glenelg, only half of the circumference of Castle Telve remained. Pennant, who examined it some fifty years later, found that the height of the remaining part was then about thirty feet. Several years before, he remarks, "some Goth purloined from the top 7½ feet, under pretence of applying the materials to certain public buildings." He is of opinion that the structure had formerly been about 40 feet in height.

There is another famous broch in the north which still shows, even in its ruins, the marks of its former greatness. This is Dun Dornadilla, in Sutherland, situated about seven miles from the north coast, close to the southern slope of Ben Hope. This broch, according to an ancient legend, was built by a king, Dornadilla by name, who died about 230 B.C.—a

tradition which may be accepted for what it is worth. The walls are now somewhat under 30 feet in height, the entire structure being about 50 yards in circumference. In some respects the most noteworthy of all the brochs is that of Mousa, situated on an island of the same name off the mainland of Shetland. From its isolated position, it has escaped the pillaging zeal of persons apt to mistake interesting remains of antiquity for convenient quarries. The present height from the level of the ground outside is 41 feet, and from the floor of the central court about 45. The feature of the building of special interest in addition to the exceptional height of the walls is the circumstance that, when seen from without, the structure has a shape somewhat resembling a dice-box. The bulging out of the wall towards the top, which produces this effect, is believed to be due to weathering, and not to have formed part of the original plan. The diameter of the building is 49 feet, that of the central court 20 feet, and that of the wall 14 feet 6 inches. There are six galleries, varying in height from 4 feet to 5 feet 6 inches. The stair which gives access to them is still in fair preservation. In the thickness of the wall there are three chambers, having entrances from the central court. The largest of these measures 16 feet in length, 5 feet 9 inches in breadth, and 9 feet 9 inches in height. The doorway, which leads through the passage to the central area, is 5 feet 3 inches high, with a breadth of about 3 feet. About half-way along this passage are to be seen the projecting jambs formed of upright stones, behind which in former times a door, in the shape probably of a rude wooden shutter, was fixed. There are, however, no signs of the bar holes behind the jambs, so common in other brochs, for the insertion of a long stone to strengthen whatever was used to barricade the entrance. Mousa has certain romantic associations connected with it. Twice in its history—first in the year 900 and again in 1154—was it the retreat of runaway couples who sought shelter within its walls. The broch of Clickemin, close to the town of Lerwick, stands on a little island in a small lake beside the sea, and is reached by a series of stepping-stones. Brochs, as a rule, are to be met with near the sea margin or on islets close to the shore. When a chain of them ran inland for several miles, they were probably used as beacon towers for signalling purposes. A good example of such a series of brochs is to be seen in Strath Brora, in Sutherland, beginning with Kintradwell on the coast, and ending with Caisteal-Coille, or the castle in the wood, some 20 miles inland.

Within recent years systematic attempts have been made to discover what can be learned from a careful examination of the brochs themselves. By the help of funds derived from the Rhind Bequest, much good work has already been done in this direction. Under the superintendence of Dr. Joass, of Golspie, and other antiquarians specially interested in the subject, various brochs have been thoroughly examined, and a list has been made of the objects which were brought to light during the progress of the work. In many cases brochs, after they had become ruined, were used as places of sepulture, and both ornaments and weapons were thus introduced at a later date among the materials of the ancient buildings. There can hardly be any doubt that brochs were originally intended as fortresses for occasional occupation, though afterwards frequently used as places of residence. The idea, which was formerly more common than it is now, that they were built as the palaces of kings or chieftains, has little to recommend it, since several of them occur close to each other within a very limited area of country. Still less likely is the theory, now abandoned, that they were built as temples. Their position, for the most part near the coast, seems to indicate that they were meant to afford shelter from the attacks of sea rovers. From their construction they were well fitted to be places, not of offence, but of defence. As Dr. Joseph Anderson puts it, "The broch is the architectural embodiment of passive resistance." The question of the age of these structures is an important, though a difficult, one. On account of their manifest identity in plan, they may all be regarded as having come into existence about the same time and under the stress of a similar necessity. In the present state of information on the subject, the theory which fixes the period of the brochs between the fifth and ninth centuries of our era will commend itself to many as the one which best harmonises with ascertained facts. Another important question connected with brochs is that of their geographical distribution. They are to be met with in greatest numbers in the most northerly parts of the mainland of Scotland, in Orkney, in Shetland, and in the Western Isles. Altogether about three hundred and seventy such structures are known to exist, and others have doubtless yet to be discovered. Several which have completely disappeared have left traces of their existence in place-names. Seventy-five are still to be found in Shetland and seventy in Orkney. In Caithness and Sutherland respectively there are seventy-nine and sixty, while in the Western Isles there are sixty-nine. There are very few on the mainland south of Inverness-shire. In Perthshire there is one at Coldoch. There are two in Forfarshire, viz., Hurley Hawkin and The Laws; while The Tappock,

at Torwood, in Stirlingshire, and Eden's Hall, on Cockburn Law, in Berwickshire, complete the scanty list. It should be added that the foundations of a building believed to be a broch were discovered not very long ago in Bute, and there is ground for holding that a similar structure formerly existed at Corriegills, Arran, between Brodick and Lamlash.

#### CONSTRUCTION OF THE FORTH BRIDGE.\*

THE total length of the viaduct will be 8,296 feet, or nearly  $1\frac{1}{2}$  miles, and there are two spans 1,710 feet, two of 680 feet, fifteen of 168 feet girders, four of 57 feet, and three of 25 feet being masonry arches. The clear headway for navigation will be not less than 150 feet for 500 feet in the centre of the 1,710 feet spans. The extreme height of the structure is 361 feet above, and the extreme depth of foundations 91 feet below the level of high water. There will be about 53,000 tons of steel in the superstructure of the viaduct, and about 140,000 cubic yards of masonry and concrete in the foundations and piers. The main piers, three in number, consist each of a group of four masonry columns, faced with granite, 49 feet in diameter at the top, and 36 feet high, which rest either on the solid rock or on concrete, carried down in most cases by means of caissons of a maximum diameter of 70 feet to the rock or boulder clay, which is of almost equal solidity. The stresses to be provided for are those arising from the weight of the structure itself, the rolling load and wind, as well as from change of temperature. The rolling load has been taken as 1 ton per foot run on each line of rails over the whole structure, or a train on each line consisting of 60 short coal trucks of 15 tons each, headed by two locomotives and tenders weighing in the aggregate 142 tons. The wind pressure provided for is a pressure of 56 lbs. per square foot striking the whole or any part of the exposed surface of the bridge at any angle with the horizon, the total amount on the main spans being estimated at nearly 8,000 tons. The material used throughout is open-hearth or Siemens-Martin steel. That used for parts subject to tension is specified to withstand a tensile stress of 30 to 33 tons to the square inch, with an elongation in 8 inches of not less than 20 per cent. That subject to compression only, a tensile stress of 34 to 37 tons per square inch, with an elongation in 8 inches of not less than 17 per cent. Strips of each class  $1\frac{1}{2}$  inch wide are to bend cold round a bar, the diameter of which is double the thickness of the strip. The tensile strength of the rivet steel is 26 to 30 tons per square inch. The superstructure of the main spans is made up of three enormous double cantilevers resting on the three piers before mentioned. Those on the shore sides are 1,505 feet, and that on Inch Garvie (an island fortuitously dividing the deep-water space into two channels of nearly equal width) is 1,620 feet in length; the effective depth over the piers is 330 feet, and at the ends 35 feet. The centre portions of the two 1,710 feet spans on each side of Inch Garvie are formed by two lattice girders 350 feet in length, and 50 feet deep in the centre, and 37 feet deep at the ends. The compression members of the cantilevers are, as a rule, formed of tubes either circular in form or circular with flattened sides. The tension members are girders quadrangular in section; the booms at their corners take the strains, and the vertical and horizontal bracing of the sides keep them stiff against the effects of their own weight and wind respectively. The steel is delivered at the works in plates cut nearly to size, and as angle bars of various sizes and lengths. Plates which have to be bent or shaped are so treated at a red heat in hydraulic presses with moulds of special construction, and all edges are planed. The plates and bars, whether composing circular members, or the booms of the girders with all the required covers, &c., are as a rule assembled in their exact positions, and operated upon by drills of special construction, which, traversing their whole length, bore nearly all the holes required for the rivetting.

In describing how the superstructure had been erected, Mr. Cooper divided the subject into the three following principal groups:—

I. The erection on timber staging, giving support from beneath, by the use of ordinary derrick cranes.

II. The erection by special appliances placed on extensile platforms, or scaffolding, which varied in position according to the progress of the work.

III. The erection by means of special cranes, which, resting on the members themselves, enabled the latter to be extended, and in turn become the support of the former.

This last system allowed the use of temporary appliances to be reduced to a minimum.

Group I.—The first plates of the superstructure comprised in this division that were dealt with, were the lower bed-plates, which rest on the masonry piers, and ultimately transmit to them the whole weight of the superstructure, rolling load, &c.

\* A Paper read by Mr. F. E. Cooper, C.E., at the Glasgow meeting of the Iron and Steel Institute.

The plates forming these were put together upon iron supports sufficiently high to enable the girders carrying the holders-up of the hydraulic rivetters to be manipulated beneath. Under ordinary circumstances the upper bed-plates would be the next parts put together, but the skewbacks, as the massive junctions at this point are termed, and of which they formed the foundations, were not as a rule sufficiently advanced to enable this to be done. Therefore, to save time, the tubular bottom members between the skewbacks were first erected and rivetted in their ultimate position, and in some cases, for a similar reason, the transverse and diagonal bracing girders were completed at an early stage. As soon as it was possible to obtain them, the upper bed-plates and skewbacks were erected, the former, as in the case of the lower bed-plates, in an elevated position, for convenience in rivetting, being afterwards lowered. Next those portions of the vertical columns, diagonal struts and bottom members over the piers, and first struts and bottom members of the first bay of the cantilevers, extending to about 40 feet above or beyond the masonry, and within reach of the ordinary derrick cranes, were placed in position. The timber used temporarily in the staging for the support of these amounted to about 10,000 cubic feet in the case of Queensferry and Fife piers, and rather more at Garvie, and the amount of steel thus erected was about 2,000 tons in each of the two former, and 2,600 tons in the case of Garvie.

*Group 2.*—The point was now reached at which the appliances under Group 2 were brought into play, and it was only after careful and protracted consideration that the system made use of was adopted. The principal conditions laid down with reference to the central portions of the double cantilevers were:—1. That in order that the men should be able to work at any height in as great security and comfort as if on the level of the ground, platforms or scaffolding of considerable area should be provided. 2. That the raising into position of the several parts of the structure should be as little as possible interrupted by wind, the ordinary derrick cranes not being then considered applicable. 3. That the weight of the platforms and apparatus should not much exceed 400 tons. 4. That the connections forming the supports should not bring excessive strains upon any part of the permanent structure. 5. That no rams of the lifting apparatus should have to exert a lifting force of much more than 100 tons. 6. That the platforms should form ultimately stages for building the top members over the piers. 7. That, for the sake of economy, material forming part of the permanent structure should be made use of temporarily as much as possible. The platforms provided were two in number, one on each side of the axis of the bridge. They were 20 feet wide and 200 feet long at Fife and Queensferry, and 350 feet long at Garvie, composed of timber planking and joists, which rested on two longitudinal girders, one on each side of the vertical columns, formed of part of the booms and bracing of the first permanent ties of the cantilever. These were carried by cross girders, constructed of plates forming part of the second and third permanent struts, passed through the northern and southern pairs of vertical columns respectively, plates being temporarily omitted for the purpose. A double set of short cross girders inside each vertical column formed the supports for the hydraulic jacks, which raised, when necessary, the cross girders first referred to, and with them the platforms. The cross girders inside the columns were supported by means of pins passing through their ends, and through the webs of the I-beams forming part of the vertical columns. The main lifting rams were  $13\frac{1}{2}$  inches in diameter, and were capable of lifting 240 tons with the water supplied to them by special pumps, at a pressure of about 30 cwt. per square inch. The total weight actually lifted by the four rams did not, as a rule, much exceed 450 tons, exclusive of friction. The plates and beams forming the vertical and diagonal columns were raised by ordinary hoists to the level of the platforms. These were then taken by small trollies to a goliath, running along temporary rails on the surface of each platform, which lifted them into and held them in place while they were bolted to those previously built.

Rivetting machines, of special and ingenious design, suspended below the platform, dealt with those portions of each tube allotted to them. As soon as a 16-foot length of the vertical columns was rivetted below, and a similar length added above, the hydraulic jacks were set in action, and the platforms were raised by successive steps of 1 foot a height of 16 feet, when the above-described operations of building and rivetting were resumed. In this way those on the centre portion of the Queensferry cantilever were raised the extreme distance of 281 feet in about twenty-four weeks. The platform girders were then trussed by links formerly used in old Hammersmith Bridge, and upon them the massive girders forming the top members of the cantilevers, between the vertical columns, were put together and rivetted. The timber platform was then laid upon the latter, and the lifting platforms and their girders, and other apparatus, were taken apart and lowered piecemeal. The lower members of the cantilevers, formed of tubes 12 feet in diameter, were extended outwards from the piers for about

40 feet by means of ordinary cranes. Beyond that point they were erected by means of an ingeniously devised crane fitted with hydraulic lifting, turning, and traversing gear. This crane was seated on a carriage, movable along the top of a framework 20 feet square and 48 feet long, first built in sections upon and surrounding the tube itself. As each section of the latter was completed in front (the men employed in bolting up, &c., standing on the timber flooring supported on the bottom of the framework), the crane was used to transfer the sections of the framework, previously unbolted, from the back to the front, and in this way the tube by successive operations was built out for a distance of about 160 feet from the piers.

As in the case of lifting platforms for the central portion, the objects kept in view in the design of this apparatus were large working platforms for the men, and for the putting in place of material cranes actuated by hydraulic power with a short lift. For the erection of the lower portion of the first strut, and of the first vertical tie and support to the internal viaduct, lifting platforms, similar to but smaller than those first described, raised by jacks placed in the vertical tie and on the vertical columns, were used. These were originally intended to have been carried up to the level of the underside of the top members, and upon them, when strengthened, those members were to have been built; but the experience gained up to this time as to the ability of the men to work unaffected in situations more exposed than was at first deemed advisable, as well as to the ease with which large and heavy pieces of material could be raised great heights by ordinary cranes and tackle with little interruption from anything but a strong wind, rendered it possible for a great modification to be made in the mode and apparatus made use of, and these platforms were carried no higher than the level of the intersection of the first ties and struts. The appliances used on the erection up to this point, though amply fulfilling all the conditions of the problem, were necessarily slow in action, and costly to make, put together, and take down; and it must be borne in mind that when the vertical columns, with their bracing and top and bottom members connecting them, were completed, an immensely powerful support was available from which the other members of the cantilever and the internal viaduct could be held up by temporary stays as securely as if supported by staging on the solid ground below. The weight of the portions of Fife and Queensferry cantilevers erected under Group II. was about 3,000 tons each; at Garvie it was somewhat more.

*Group 3.*—With the exception of the first bay of the lower members, the first 120 feet of the internal viaduct, and the lower portion of the first struts, the whole of the principal members of the cantilever are included in this group. Two types of special cranes are employed, one made use of to build the top members and upper halves of the struts and ties. The other is traversed along the internal viaduct, and deals with the remainder of the work. The top member crane is provided with a horizontal jib, 35 feet in length, which can be slewed through an arc of 230 degs., and along which the suspending pulleys can run. The lifting of the material is effected by a steam winch, the main drum of which accommodates about 400 feet of wire rope  $1\frac{3}{4}$  inches in circumference. This crane is supported on a carriage, formed of two steel cross girders strongly braced, and which rest on the upper surface of the angles connecting the vertical webs to the flanges of the booms of the top members, and along which, when desired, it is traversed by means of powerful screws. In some cases, at the back of the carriage a hydraulic crane is attached, along the horizontal jib of which run the supports for a hydraulic rivetter, used for completing that part of the work within its reach. An ordinary derrick crane is sometimes substituted for this part of the apparatus. Beneath the top member, and strongly attached to the carriage of the crane, is suspended, on four longitudinal girders, a roomy platform of timber, 76 feet long and 45 feet wide.

The building operations are thus carried on. Each length of the vertical webs of the top members is first raised by the ordinary hoist to the level of the internal viaduct. It is then carried on a trolley to a point beneath the jib of the top member crane, which raises it to its exact position, and holds it there, while the men standing on the platform bolt it to that already complete. The lower booms are first thus secured, then the vertical and horizontal bracing bars are fixed, and lastly the top booms. When the length is complete, the carriage is slid down a convenient distance, and the building operations are again resumed, and are continued until the member reaches the centre of the bay. When, in the case of bay 1, the overhang was 125 feet, and the strain on the vertical bracing (temporarily doubled) had nearly reached the working strain of  $6\frac{1}{2}$  tons per square inch, with the end of the members deflected about 8 inches, a temporary continuation of the vertical tie in the centre of the bay was built up to the underside of the top members, and jacks being interposed, the latter were raised the amount they had deflected, and secured by wedges. Similar extensions of the vertical ties will be required in the case of the other bays in order to support temporarily and adjust the top

members above them. The crane then continued the building until the top members reached the junction at the upper ends of the first struts, where any deflection in them was again removed, and the permanent connections at this point were completed. At convenient intervals the building of the top member was suspended, and the crane employed first in building down the ties, which operation was similar to that already described for the top members, except that the men occupied stood on small timber stages suspended from and enveloping the member, and which were lowered as required by ordinary tackle. Afterwards, the upper halves of the struts were built in the same way, except that the extension was in the reverse direction.

In order to prevent excessive strain on the unsupported lengths of both ties and struts, temporary struts from the vertical columns were put in where required, light girders and wire ropes being also largely made use of. The internal viaduct crane consists of two masts and jibs of the derrick type, the former in line transversely with the axis of the bridge, and 16 feet apart, braced strongly together, and secured to a movable timber frame traversed along the outer rail troughs of the viaduct. Each jib is raised and lowered by means of a wire rope passing round a drum on the mast, but the wire rope lifting the material is passed through a sheave at the extremity of the jib; thence it is led over a sheave down the centre of the mast, and by means of guide pulleys to some convenient point on the finished structure, whence to a steam winch. The object for separating the power from the crane is to lessen the weight concentrated at that point, the viaduct there being extended much in advance, and as a rule acting as a cantilever, its outer end being temporarily supported by wire ropes to some part of the finished structure. When the viaduct girders are being extended by these cranes little staging is required, the men being able to do the bolting up standing in the troughs forming the top and bottom booms. To provide the necessary standing room for the men when at work on the lower members, light platforms of timber are hung from the tubes by trusses of convenient form. For the building of the lower portions of the struts and ties the same stages are used as described in the case of the upper portions of these members. Steam winches, with blocks and tackle attached to convenient points, are used to lift into and hold in position the parts, not usually exceeding two tons in weight each, of the wind and other bracing of the various members, the men doing the bolting up either hanging on to the parts themselves or standing on planks placed where necessary. Wire ropes are now almost entirely used for the cranes, running gear, and temporary support, being found most trustworthy, and, when treated properly, should never give way. The rivetting of the bottom members of the cantilever, of the vertical columns, and of portions of the diagonal struts between them, has been executed by hydraulic rivetters of special design, the principle of which has been to use independent rams for the holder-up and the snap. The holder-up could be traversed along a girder usually pivoted so as to revolve on the axis of the tube, or with its ends moving in a race, so that the girder moved round the tube parallel to its axis. In both cases the holder-up preserved its direction normal to the surface. The snap was fixed in a ram which also could be traversed along a girder, the latter being movable parallel to the axis of the tube, with its ends travelling in slots formed in rings surrounding the tube. By this arrangement of motions both holder-up and snap could deal with every rivet.

The operation of rivetting was as follows:—The rivet, properly heated, was placed from the inside into its hole, the holder-up was brought opposite to it, the valve admitting the water was turned on, the holder-on thrust the rivet in up to the head, and held it there, whilst the ram on the outer girder closed the rivet, the same valve admitting water to both rams, but a slight check in the branch leading to the outer ram permitted the rivet to be sent home by the inner ram before the pressure was applied to form the snap. About 800 rivets could be closed by this apparatus in ten hours. The bed-plates, both upper and lower, were rivetted by similar apparatus, but simplified inasmuch as plane surfaces only had to be dealt with. For the interior parts of the skewbacks, where the space was too confined for hand-rivetted, or for the use of rams of ordinary size, special rams of small size, 4 inches in diameter, were used as holders-up and snaps, the necessary power being obtained by multiplying the ordinary pressure of 1,000 lbs. about six times, by the use of an apparatus fitted with rams 4 inches and 10 inches diameter. Grab machines of various patterns were designed and made by Mr. Arrol for the rivetting of the top members, for the ties, and for parts which could be reached by this form of rivetter. Mr. Arrol has also greatly simplified the subject of rivetting by designing and constructing small reverberatory furnaces for heating the rivets by the blast-furnace residual oil, delivered in a fine spray by air at about 20 lbs. pressure, through a disintegrator of special design. This has been a great success. The regulation of the heat is complete, the rivets are uniformly heated, the apparatus is more

economical than hand fires, and is under perfect control. It is also cleanly, and the danger from fire is much reduced. A small furnace, 1½ feet square and 4 feet long, will heat 2,000 rivets per day, at a cost for oil of about four shillings.

### STRATA FLORIDA ABBEY.

IN connection with the excursion of the Cambrian Archaeological Society a visit was paid by some of the members, conducted by Mr. Stephen Williams, of Rhayader, to the ruins of this abbey. After inspection, the party adjourned to a neighbouring farmhouse. Mr. E. Laws observed that about 160*l.* had been spent in the removal of 3,500 cubic yards of material, complimented Mr. Williams on the excellent results that had been attained by him in laying bare the ground plan of the abbey church, and suggested that precautions should be taken to preserve the remains from spoliation and decay by fencing in the buildings and roofing over the encaustic tile pavements.

Mr. Williams described the progress of the excavations with the aid of a plan and numerous drawings of the various details recovered. The whole of the lower portions of the piers of the nave were now laid bare, showing that they were rectangular for about 6 feet above the floor-line, and surmounted by round, clustered pillars. The carved capitals and arch mouldings had also been found, with the setting-out lines still visible upon them. On the east side of the north and south transepts were six chapels, three on each side of the choir, containing altars and having groined roofs with carved bosses. The encaustic pavements in these chapels were exceedingly fine, and in splendid condition, being of thirteenth-century date, arranged so as to form coloured patterns of great beauty. The centre of the nave was still untouched, and no attempt had yet been made to trace the plan of the surrounding conventual buildings.

Mr. J. P. Seddon compared the architectural details found at Strata Florida with those of the cathedrals of Llandaff and St. David's. He pointed out that the sculpture at Strata Florida was of a remarkable character, as exhibiting Transitional forms between the stiff foliage of Norman times and the graceful flowing lines of the capitals at York and Lincoln. The interlacing of the leaves and stems indicated a survival of Celtic feeling. The tile pavements were quite unique. Tourists had already begun to show the cloven hoof by carrying away tiles, damaging the general effect irretrievably.—Mr. Romilly Allen called attention to the exceedingly curious series of graves on the outside of the east wall of the south transept. Each pointed east and west. A long slab of slate with a plain cross was laid flat on the grave, at the foot was a small upright stone, and at the head an upright cross of Bath stone, with interlaced work carved on the face. The dressing of the headstones and the general character showed that they were probably of the twelfth century, but the interlaced work was evidently a survival of a previous style.

### Theatre Exits and Fire Risks.

SIR,—The letter in your last issue under this heading, and signed "An Architect," clearly and sensibly points out the necessity of the theatre-going public and the press insisting upon the scenery and accessories of theatres being covered with a non-inflammable composition, on the ground that most fires in theatres arise from contact of flame with the light woodwork and canvas with which the stage is surrounded. It is curious to note how the scare occasioned by the deplorable loss of life at the Exeter Theatre, and the minor disasters at the Grand Theatre, Islington, and elsewhere seems to have faded from the public mind. "Extra" and "emergency" exits, iron and asbestos curtains, and many similar precautions for safety from fire, have allayed the public alarm. In Mr. Paul Lamberts' able communication, published in your issue of the 17th, grave doubt is thrown upon the efficacy of asbestos and iron curtains to prevent the spread of fire in theatres, on the grounds that asbestos becomes incandescent when subjected to flame, and is consequently a conductor of heat, and that iron, under the influence of high temperature, rapidly expands, with the consequence that a curtain composed of these materials would be rendered useless in the case of a fire on account of warping and distortion. A plain conclusion is drawn from these opinions, and that is simply that prevention is better than cure. Why waste time in devising means to stop the spread of a fire when it is quite possible to prevent the fire from taking place at all? There are several fireproofing preparations at present before the public, but an undoubted defect in many of

them is the fact that they rot or render brittle fabrics that are treated with them.

"Pyrodene," lately used at several leading theatres, appears to have overcome this obstacle. Any inflammable article, such as paper, textile fabrics, wood, &c., soaked in this liquid defies all attempts to set it alight, besides increasing the endurance of the article subjected to its influence. If architects and managers will adopt the means at their hands to prevent the possibility of the commencement of a fire, by rendering inflammable all the flimsy surroundings of the stage, the grave question of "Theatre Fire Risks" is effectually and satisfactorily answered.—Yours faithfully,

Junior Garrick Club, W.C. :

August 28, 1888.

FRED. S. HOBLYN.

SIR,—Noticing in your issue of the 17th inst. a letter from one of your correspondents headed "Theatre Exits and Fire Risks," I take the liberty of submitting certain information which may be of some service to your numerous readers.

After a report made by you early this year with reference to some tests conducted by Mr. W. H. Stanger, C.E., to determine what materials were best adapted for use in the construction of fireproof buildings, I made several experiments with the "silicate cotton" or "slag wool," so favourably mentioned in your report, and found it to be admirably well adapted for fireproofing purposes, for the reasons set forth by your correspondent. I have found that "slag wool" does not become incandescent throughout when a body of it, say 1 inch thick, is subjected to extreme heat, but simply the parts in immediate contact with the flame become fused, leaving the rest perfectly intact. I found, further, that when heated through, after a lengthy subjection to the flames, there was no symptom of radiation whatever, a thermometer held within  $\frac{1}{4}$  inch of the surface not indicating any variation.

The fireproof curtains fixed up in the different Liverpool theatres by Mr. Max Clarke, of London, being all lined with "slag wool," must most effectually prevent the transmission of heat, whilst equally shutting off smoke and flame. No doubt there are many ways in which "slag wool" might be employed for fireproofing purposes generally in a building, and I have no hesitation in saying that it will be found to be one of the most efficient of the non-conducting substances suggested by your correspondent.—Yours truly,

CHAS. PERKS.

Rose Hill, Bowdon, Cheshire :

August 27, 1888.

SIR,—I fully endorse Mr. Paul Lamberts' opinion expressed in your issue of the 17th inst. with reference to the mistaken idea that iron and asbestos curtains are safeguards against fires spreading in theatres. He is quite right when he observes that they become incandescent when subjected to flames, and while in this state they form an excellent medium for conveying the heat to the auditorium rather than for keeping it away. But why have a flame at all to cause this incandescence? It is not because modern science has failed to provide us with the means to prevent it. There are at the present moment a number of fireproofing preparations before the public of undoubted merit, which, if they were more generally used, would reduce our fire risks to a minimum. Take "Pyrodene," for instance. Any inflammable article, such as paper and textile fabrics, soaked in this liquid and allowed to dry, defies all attempts to set it alight. (I mention this particular article because it appears to me free from anything which rots or renders brittle fabrics so treated, a rather unfortunate defect in most others, though equally effective as fireproofers.) Most large fires have a small beginning. A lighted match or gas-jet touches some inflammable material, and the building is instantly in flames. If these were treated as I have suggested, and a light accidentally touched them, they would simply refuse to inflame; the only damage done would be a charred spot where the flame had actually touched. Here, I take it, the difficulty is overcome. Let architects and theatrical managers adopt these means to render the too often flimsy stage materials flame-proof, and they will prevent fires from starting, which to my mind is a far more reasonable method than attempting to prevent a fire spreading after it has started.—Yours, &c.,

August 23, 1888.

A. C.

#### "Mr. Gladstone on Pottery."

SIR,—Under the above heading, I have just read a short article from your esteemed journal, copied into the *Morning Post*, of yesterday's date. It runs thus:—"Mr. Gladstone is no great connoisseur in pottery, if we may judge by his collection when it was seen at Christie's, but he has aided in obtaining recognition for the merits of Josiah Wedgwood." Will you permit me to differ with you in this remark, because from personal knowledge and observation I happen to know that there are very few better judges of ceramics in England than the ex-Prime Minister. His collection of porcelain and pottery, when sold at Christie's some few years ago, contained many

very fine and rare specimens of old Wedgwood, Chelsea, Worcester, Derby, &c., and realised exceptionally high prices, purely on their own merits, and quite apart from their having belonged to so distinguished a collector. I do not wish to enter into any controversy upon the marvellous productions of the "immortal Josiah"; it might appear egotistical on my part, possessing as I do a very extensive collection of his cameo wares, but Mr. Gladstone is correct in saying that Wedgwood's pottery was never equalled, much less surpassed, by any man, in any country or in any age.—Your obedient servant,

FELIX JOSEPH.

The Grand Hotel, Eastbourne : August 26, 1888.

#### School Board Inquiry.

SIR,—Since my notice to move for a Royal Commission appeared on the Board's agenda paper, I have been favoured amongst others with a large number of anonymous letters giving me information of facts connected with the purchase of sites and erection of schools, which are certainly most fully borne out by the evidence given before the special committee on the Works Department obtained by me in October last. This evidence has just been published, contained in over 500 pages of matter, and which I would strongly urge upon the ratepayers of the Metropolis, who take an interest in the doings of the London School Board, to peruse. They will, I think, understand therefrom how their money has been wasted, and how the Works Department has been conducted under past Boards. As your paper will, no doubt, be read by those persons who have written to me anonymously, I venture to ask them to kindly give me their names and addresses in order that I may communicate with them personally. Any information thus given me, they may rest assured will be treated confidentially until such time as I have their authority to use it publicly. It is needless for me to add that I have had, and still have, great opposition from certain quarters in the thankless task I and other members have undertaken. This must be my excuse for troubling you with this letter.—Yours faithfully,

J. T. HELBY,

Member of the London School Board.

Glengarriff, Herne Hill, S.E. : August 23, 1888.

#### Registration of Plumbers.

SIR,—What has become of the Scottish Registration Scheme for Plumbers? I have neither heard nor seen anything in the professional journals for some time past in reference to this matter. Has it exploded, or is it still in existence, and if so, why is it not made public? This idea of voluntary registration is certainly good, but why does not some such body as the Worshipful Company of Plumbers seek the power of compulsory registration, so that architects and the public may not be victimised by bad and defective plumbing?—Yours, &c.,

Glasgow : August 29, 1888.

A SCOTCH ARCHITECT.

#### ARCHÆOLOGY.

**Scythian Remains.**—The *Allgemeine Zeitung* gives an account of a sepulchral discovery made in the Kuban, not far from the Krimskaya railway station. The district abounds with sepulchral mounds, one of which was opened at the request of the Imperial Russian Archæological Commission. A large vaulted building was found, between 60 feet and 70 feet long. It was divided into three chambers and a corridor. The walls were made of thick stone flags, about 4 feet high; the floor and roof was similarly constructed of flags, joined together by cement. The height of the chambers varied from 7 feet to 11 feet. The entrance to the innermost chamber was closed with flags. Within it were broken iron fragments of a wheel and reins, and bones of a horse. In a corner was a great amphora of clay, beside it a silver drinking vessel, and near them about 150 glass beads, some of evidently Egyptian origin. Some had the form of a medallion set in silver. Lying parallel with the side-wall of the first chamber was the skeleton of a young woman, with her head to the east. The experts consider she was a queen. She had a thick necklet of gold. Near her was a thin triangular gold plate, nearly 8 inches broad, with holes at the corner, showing that it was to be attached to the dress. There was stamped upon it the figure of a young Scythian presenting a drinking horn to a queen, who was richly clothed, and wore a cap of a material fashioned like lace, with a small gold shield on it. On the right and left of this queen was the figure of a woman, the head covered with a cloth. Medusa heads, a chariot with horses, and other figures are also represented on this triangular gold plate, which thus becomes important in the history of art in the Scytho-Bosphoric district. Very near where this gold plate lay sixteen pigeons cut from gold-leaf,  $\frac{1}{2}$  inch wide, were found, and about fifty other objects similarly cut from gold-leaf, resembling Medusa heads, stars, &c. Two gold earrings of filagree work of fine quality lay near the head of the skeleton. There was

also lying near a gold chain with a lion's head at the end. On both arms was a massive gold bracelet, snake shape, at the ends of which were horse heads attached to snake bodies. A large gold ring was on the finger of the right hand; it bore the effigy of the Muse Erato, playing the lyre. The next chamber was empty, the floor covered with a thick layer of ashes. Then came a corridor, the walls lined with stucco, on which was modelled the figure of an antlered stag. At the end of a corridor the bones of a horse lay in a heap, with fragments of various pieces of harness. At the entrance to the third room there was a quantity of broken pieces of amphoræ, which had, no doubt, been destroyed by the falling-in of the roof. The last room was larger than the others, and about 4 feet higher. The flags were alternately large and small, and the stuccowork was of a superior style. There were a few utensils in the room of copper, much corroded. A great copper dish was near a large amphora in a corner; on it were two silver drinking-cups, one of which had a gold band round the rim, on which birds were carved. Close by was a large copper shield. A male skeleton, with the head to the east, lay parallel with the side wall. A thick gold band, weighing a pound, was around the neck; the ends represented lions devouring wild boars. Near the skeleton was a silver quiver inlaid with gold, on which figures were drawn with much skill. Near this was another similar quiver with 100 copper arrows, a Scythian sword with a gold handle, and a cylindrical stone for slinging, through which a hole was bored. The experts are satisfied that this was the burial-place of a Scythian king. From the remains of boards which lay near, it would appear that both skeletons were originally placed in coffins. The value of the objects found has been set down at 50,000 roubles. Everything has been removed to the Imperial Museum at St. Petersburg.

### CHURCH BUILDING AND RESTORATION.

**Manchester.**—The contracts for the several works required in the erection of the Jesse Haworth Memorial Church have been let to Messrs. S. Hobson, of Rawtenstall, and John Smith & Sons, Thomas Cornall, and John Kay & Sons, of Bury, and building operations have been commenced. The site, which is several acres in extent, and sufficiently large for schools and vicarage house, is in a commanding position on the road leading from Walshaw to Lower Croft, and has been given by Lord Derby. The accommodation is nominally for 550 worshippers. The architect is Mr. Lawrence Booth, of Manchester.

**Rochester.**—The foundation-stone has been laid of a new Primitive Methodist chapel and school. It is built of pressed and common red bricks, with local stone dressings in Early Gothic style. The chapel, which seats 150 persons, contains vestibule, rostrum, and communion table, and has an open, seven-sided, barrel-shaped roof carried by three trusses. The whole of the wood is pitch-pine, stained and varnished, and the windows are of cathedral-tinted glass. The schoolroom is estimated to accommodate, with the classrooms, 100 scholars, the whole building being well ventilated, heated with hot-water pipes, and lighted with gas. Mr. George William Bradford, Hanley, is the architect, the builder being Mr. William Thorley, of Snelston, near Ashbourn.

### NEW BUILDINGS.

**Edinburgh.**—The Lord Dean of Guild has granted a warrant to the Edinburgh Town Council to convert the present Police Court-room in the Police Chambers into offices, and to make other alterations on the ground floor, to convert certain offices on the first flat into a new court-room and offices, and to improve several of the other offices, and also to form in the roof over the housekeeper's house an additional storey consisting of two rooms and a bath-room, and to make numerous minor alterations. It is intended to have on the ground floor apartments for the chief constable, his clerks, the superintendent of the Central Division, the lieutenants, and the Criminal Investigation Department. On the first flat there will be, in addition to the Police Court, accommodation for the clerk of court and the procurator-fiscal. The burgh engineer's office, which is at present on the first flat, will, it is intended, occupy the flat above the house formerly used by the chief constable. The medical officer of health and the collector of police rates will not be affected by the proposed changes. A new entrance to the detective department is to be made from Parliament Square, and an entrance to the new court will be made from the old Fishmarket Close by means of a stair.

**Kingussie.**—The foundation-stone of the public-hall and reading-room for Kingussie has been laid. The hall is a handsome building, designed by Mr. Mackintosh, architect, Inverness, and will furnish accommodation for about 500 persons. The hall is lighted by five large windows on each side of the building, and ventilation is secured by four ventilators in the

roof, and four ventilating shafts run from floor to ceiling. In the north end there is a recess for a platform, in which one is to be constructed.

### GENERAL.

**An Exhibition** of paintings and sculpture is to be held at Kilmarnock under the auspices of the Local Fine Art Institute during the ensuing winter. The Marquis of Bute will be asked to preside at the opening.

**Professor Angeli**, of Vienna, is engaged on a portrait of the Emperor of Germany, who, notwithstanding all the work he has undertaken of late, has found time to give a sitting of some hours to the painter.

**Two Stained-Glass Windows**, designed by Mr. F. Burne Jones, A.R.A., and executed by Messrs. William Morris & Co., Merton Abbey, have been placed in St. Philip's Church, Birmingham, and also a font designed by Mr. J. A. Chatwin.

**Professor Rhys**, of Oxford, has been selected to deliver the Rhind Lectures at Edinburgh next year. His subject will be "The Early Inhabitants of Britain, with Special Reference to Scotland."

**It is proposed** to memorialise the Government to erect a new post-office at Ayr. The present building is not considered adequate.

**Mr. C. F. Wike**, assistant borough surveyor, Leicester, has been appointed borough surveyor for Sheffield, at a salary of 800*l.* per annum.

**The Dean of Peterborough** has issued an appeal for funds to complete the restoration of the cathedral. At present 18,000*l.* is required merely to secure the safety of the fabric, after which he hopes to undertake the restoration of the choir.

**An Amalgamation** between the Sanitary Institute of Great Britain and the Parkes Museum has taken place, and the objects of the two societies will in future be carried on by the Sanitary Institute, incorporated this month.

**Plans** for a new church to be erected at Pinxton, near Alfreton, by Mr. G. Statham, of Matlock and Nottingham, have been selected in competition.

**The Late Mr. T. Heygate Vernon, A.R.I.B.A.**, who for several years carried on the professional practice of Mr. E. M. Barry, R.A., has now been succeeded by Mr. E. Elton Hawkins, of 19 York Buildings, Adelphi, W.C. The latter gentleman was for a long period associated with both the deceased architects.

**The Norwich Town Council** have decided to invite the Royal Archaeological Institute of Great Britain to hold its summer congress next year at Norwich.

**The Plans** of Mr. Owen, of Warrington, for the extension of the town workhouse, have been forwarded to the Local Government Board for approval.

**At the Birmingham Library**, Union Street, some additional buildings comprising a gentleman's smoking-room, a ladies' drawing-room, and a librarian's room, with entrance lobby opening into the ground floor of the old library premises, have just been completed.

**M. Charles Garnier** has been appointed a member of the Commission on French Theatres, which is to report to the Minister on all questions relating to the safety of the buildings.

**The River Wear Commissioners**, on Wednesday, sanctioned the expenditure of 11,000*l.* for improving the approaches to the Sunderland docks.

**The Ordnance Survey** of Bolton and suburbs, on the large scale, has been commenced under the supervision of Captain Sankey, R.E.

**A Committee** has been appointed to consider the subject of erection of a market, town hall, town offices, &c., at Llandudno, on the vacant spot between Lloyd Street and the present market hall.

**A Tunnel** is being driven underneath Lake Michigan, through which the water supply of that city is to be drawn, and has already been carried upwards of 280 feet below the lake.

**A Gentleman** in Driffield has offered to defray the cost of building a public clock tower for the town, if a bell of not less than two tons is provided for the clock, which has been given by Mr. Holtby, of Nafferton.

**Casamicciola**, which was laid waste by the earthquake, is fast rising again into life. About eighty pretty châteaux have been erected around the wood and iron houses of the village, capable of lodging 3,000 persons. Private villas of two storeys, of wood and surrounded by gardens, have also been erected. The large bathing establishment is ready, and another is in course of construction, while cafés and restaurants are not wanting. The Pio Monte della Misericordia is spending three millions of francs on the erection of an hygienic establishment for its patients. Next to this building will soon rise an hotel, built of wood and iron.

CRIMINAL PROCEEDINGS, under the new Merchandise Act, will be instituted against any person falsely representing any form of ventilator to be a Self-acting Air-pump Ventilator, said title being registered and our Trade-Mark, applicable only to ventilators manufactured by us. Any infringement renders the person infringing liable to two years' imprisonment. ROBERT BOYLE & SON, Ld.

### COMPETITION OPEN.

GORTON.—Sept. 15.—Designs are Invited for Public Baths. Mr. R. T. Holland, Clerk to the Local Board, Local Board Offices, Gorton.

### CONTRACTS OPEN.

ALLITHWAITE.—Sept. 1.—For Extension of Schools. Rev. J. Hammersley, Allithwaite Vicarage, Grange-over-Sands.

BACKWORTH.—Sept. 1.\*—For Building Mission Church, Shire Moor. Messrs. Hicks & Charlewood, Architects, 42 Grainger Street, Newcastle-on-Tyne.

BARNET.—Sept. 5.—For Construction of Stove and Furnace, with Flues, &c., in the Tailors' Shop at Workhouse. Mr. G. D. Byfield, Clerk to the Guardians, High Street, Barnet.

BLACKPOOL.—Sept. 5.—For Building Theatre and Five Shops, Church Street. Mr. W. Longley, Architect, 5 Charles Street, Bradford.

BRADFORD.—Sept. 6.—For Altering Old Post Office Buildings (Painterwork excepted) into Shop and Offices. Messrs. Milnes & France, Architects, Bradford.

BRIDGEND.—Sept. 7.—For Building Church, Kenfig Hill. Messrs. Halliday & Anderson, Architects, 16 High Street, Cardiff.

BRIXTON.—For Building Baptist Chapel, Wynne Road. Mr. J. Wallis Chapman, Architect, 11 Sutherland Avenue, Harrow Road, W.

CHELSEA.—Sept. 1.—For Alterations and Additions to 107 and 108 Cheyne Walk. Mr. F. Cole, 107 Cheyne Walk, Chelsea.

CHESLYN HAV.—Sept. 15.—For Building New Schools. Mr. W. Wood, Architect, Longton.

CONSETT.—Sept. 8.—For Additions, &c., to British Schools and Formation of Road. The Secretary, Consett Iron Company, Limited, Blackhill, County Durham.

DEWSBURY.—Aug. 31.—For Additions, &c., to Pioneers Industrial Society's Stores. Messrs. Holtom & Fox, Architects, Westgate, Dewsbury.

\* Names and addresses to be forwarded not later than date.

DUNSTABLE.—Aug. 31.—For Finishing Two Villas, Station Road. Messrs. Benning & Son, West Street, Dunstable.

EDINBURGH.—Sept. 1.—For Construction of Bath-room at Hospital of the Poorhouse, Craiglockart. Mr. Washington Browne, Architect, 5 Queen Street, Edinburgh.

EPSOM.—Sept. 12.—For Building Porter's Lodge, Tramp Wards, Day-room, Dormitories, and Dining Hall, at the Workhouse. Mr. H. D. Appleton, Architect, 157 Wool Exchange, Coleman Street, E.C.

FERNDALE.—Sept. 1.—For Building Nine Houses. Mr. Jones, Architect, Cymmer.

GLOUCESTER.—Sept. 10.—For Building Crypt and Grammar School. Messrs. Medland & Son, Architects, 15 Clarence Street, Gloucester.

GRAVESEND.—Sept. 10.—For Alterations, Shop Fittings, and other Works at Nos. 3, 5, and 7 Harmer Street, for Co-operative Society. Mr. A. G. Smith, Architect, 1 Darnley Street, Gravesend.

GREAT YARMOUTH.—Sept. 3.—For Adding Classroom to Caister Board Schools. Messrs. Hewett & Banham, Architects, 10 Regent Street, Great Yarmouth.

GRIMSBY.—Sept. 3.—For Building Cemetery Chapels, Lodge, Waiting-room, Mortuary, &c. Mr. E. W. Farebrother, Architect, Victoria Street, Grimsby.

HEADINGLEY, LEEDS.—Sept. 1.\*—For any or all of the Works in the Erection of Six Houses. Messrs. Swale & Mitchell, Architects, 98 Albion Street, Leeds.

HOLBORN.—Sept. 5.—For Pointing Brickwork for the Guardians. Messrs. H. Saxon Snell & Son, Architects, 22 Southampton Buildings, Chancery Lane, W.C.

KIRKBY-IN-FURNESS.—For Parish Room. The Vicar Kirkby-in-Furness.

LEEDS.—Sept. 3.—For Additions to House. Messrs. Swale & Mitchell, Architects, 98 Albion Street, Leeds.

LEEDS.—Sept. 4.—For Building House. Messrs. J. Charles & Sons, Architects, 98 Albion Street, Leeds.

LICHFIELD.—Aug. 31.—For Building Girls' Industrial School. Mr. J. T. Meredith, Architect, Bank Buildings, Kidderminster.

LINDLEY.—Aug. 31.—For Additions to Acre Mills. Messrs. John Kirk & Sons, Architects, Huddersfield.

LITTLEPORT.—Sept. 7.—For Rebuilding Brandon Creek Bridge. Mr. T. H. B. Hestop, Norwich.

LONGTON, STAFFS.—Sept. 15.—For Building two Houses near Clayton Street. Mr. W. Wood, Architect, Longton.

NEW BRAMPTON.—For Building Chancel to Church. Messrs. Naylor & Sale, Architects, Irongate, Derby.

NEWCASTLE-ON-TYNE.—Sept. 5.—For Alterations at Central Station. Mr. C. A. Harrison, Engineer.

NEWCASTLE-ON-TYNE.—Sept. 5.—For Extension of Central Station Hotel. Mr. Wm. Bell, Architect, Central Station, Newcastle-on-Tyne.

NEW WORTLEY.—Sept. 4.—For Building Two Houses and Shops. Mr. J. Fawcett, Architect, 26 Albion Street, Leeds.

PUDSEY.—Sept. 3.—For Boundary Walls, Gates, Palisades, and Building Lodge at New Park. Mr. C. S. Nelson, Architect, Albert Chambers, Park Row, Leeds.

PUDSEY.—Sept. 5.—For Building Scribbling Shed, &c., Priestly Mill. Mr. E. Wright, Architect, Greengates, Eccleshill, Bradford.

SOUTH SHIELDS.—For Building Two Houses. Mr. J. Walter Harrison, Architect, Exchange Buildings, South Shields.

\* Names and addresses to be forwarded not later than date.

ST. OLAVE'S UNION.—Sept. 5.—For Painting, Cleansing and Repairs, Supplying and Fixing Hot Water Tanks. Messrs. Newman & Newman, Architects, 31 Tooley Street, E.C.

WINDSOR.—Sept. 4.—For Building Goods Shed. Mr. J. D. Higgins, Secretary, Paddington Station.

## CONTRACTORS TO H.M. GOVERNMENT.

INTERNATIONAL HEALTH AND OTHER EXHIBITIONS—MEDALS AWARDED FOR

# LEGGOTT'S PATENT ADJUSTMENT

CONTINUOUS OPENER.

SILENS.

THE SILENS, for Fanlights, Skylights, &c. Is admitted to be the best ever put before the Public. Can be adapted to any kind of window. Size and height of window no object.

From 4/3 each.

The WILMOS is worked with a rod or endless cord. It is extremely neat, and can be fixed to open either top or bottom, inwards or outwards; no cutting away of frame required. When worked with a rod is most efficient for Public Buildings, as the key can be loose. For Price Lists, Illustrations, and Testimonials, write as below.

For Continuous and other Lights, Estimates given.

WILMOS.

NO CUTTING AWAY OF FRAME REQUIRED.

#### TESTIMONIAL.

SIRS,—I have pleasure in testifying that I have used Leggott's Silens Adjustments for various buildings to high skylights, fanlights, and top parts of windows, and in every case they gave satisfaction.

They are secure in whatever position, whether the window is open or closed, and are quite simple and workable in their action. I prefer them to any other that I have seen or used for the above-mentioned purposes.

Messrs. W. & R. LEGGOTT, Bradford.

I remain, yours obediently,

R. DAVIES, Architect.

Considerably Reduced Price List, November 1, 1887.

ALL WORK ENTRUSTED TO US GUARANTEED SATISFACTORY.

TRADE NOTES.

In a previous issue we gave a description of the "Remington" type-writing machine, and pointed out the many ways in which it would be of great assistance to architects and builders, and also its superiority over its competitors. This we are pleased to see has been demonstrated at a contest of type-writers on July 29 at Cincinnati, where the operator on a "Remington" wrote 8,709 words in 90 minutes, as against 6,938 words on the next best, or an excess of 25.38 per cent. The sole proprietors and manufacturers are Messrs. Wyckoff, Seamans & Benedict, 100 Gracechurch Street, London, E.C.

MESSRS. FRANCIS BARKER & SON, of 12 Clerkenwell Road, E.C., a well-known and old-established firm of scientific instrument makers, have issued a catalogue of horizontal and vertical sun-dials, of which they have made a speciality for a number of years. There is no reason why sun-dials should not be used more generally than they are at present, as with a good architectural pedestal they are a great ornament to any garden, especially when standing on a raised granite platform with several steps; and they of course, when properly fixed, must necessarily give the correct time—a great advantage in country districts, where it is often difficult to set the clocks of the household by any reliable time-piece. Messrs. Barker & Sons make them in a variety of forms and materials, the most durable being in brass.

ALTERATIONS have been made to the Thatched House Club, St. James's Street, S.W., embracing the ventilation, which is now carried out on the Boyle system, the latest improved form of the self-acting air-pump ventilator being adopted for the extraction of the vitiated air, and the fresh air admitted by Boyle's improved air inlets.

THE new Boys' Public Day Schools, Kentish Town, are warmed and ventilated by means of the Patent Manchester Grates, supplied by Mr. E. H. Shorland, of Manchester and London.

A MEETING of the Birmingham Compressed Air-power Company was held on Friday, when it was stated that there were 3,362 yards of main now laid, and by the end of the week there would be two miles of main finished. The work was being vigorously pushed on in the streets where factories were numerous, and there was every expectation of a large demand for the power. Already it was in use in some of the manufactories, so that shareholders could see it in operation on customers' premises. Some manufacturers were hesitating till the

pipes were laid in their district, when no doubt they would immediately require connection, so as to be provided with the power from the company's works. It was also mentioned that in Paris there were thirty miles of mains worked with 3,000 horse-power.

MESSRS. E. & W. J. LONGMIRE write to us:—By an oversight our tender for works at West Kensington, for Mr. Alexander Payne (*The Architect*, August 24), has been sent to you for publication as that of "Longmire & Burge." As there has been no such firm for some time past, may we ask you to correct this? the present style of our firm being William Longmire & Co., and the partners E. & W. J. Longmire.

A VIADUCT for the North British Railway over the Earn at Hilton, in the neighbourhood of Perth, has been completed and open for traffic. Much time and trouble was absorbed in securing a proper foundation owing to a deep layer of soft sand, and a depth of 50 feet had to be attained before a solid stratum on which to rise the pillars was reached. Cylinders were then sunk and filled with concrete after the usual fashion, and upon these freestone pillars were built to a height of 30 feet, finished with a massive granite coping, and tested with a weight of 500 tons. The main girders were built on a platform some distance from the site of the bridge, and subsequently moved into position by means of hydraulic jacks. The centre girders are 100 feet long, and weigh about 50 tons. The total length of the bridge is 250 feet, and, irrespective of the pier cylinders, 450 tons of iron have been used in its erection. The foundrywork was done by Messrs. Goodwin & Co., Motherwell, and the building work by Mr. W. Oliver, Edinburgh.

THE Regent Ironworks, Bilston, which have stood idle for several years, have been taken by the Albion Iron Company (Messrs. Lewis, Greenway & Dangerfield), who also carry on business at the Albion Works, West Bromwich, and Batman's Hill Works, Coseley. The Regent Works will give employment to 200 hands.

THE committee for erecting the proposed new church, All Saints, North Moor, Oldham, are taking steps for carrying out the scheme. A plot of land for a site has been given by a resident. The church is to cost 5,000*l.*, and sittings will be provided for between 500 and 600 persons.

THE property in Cross Guns Court, Chester, occupied by labouring classes, requiring improvement, the Duke of Westminster, the owner, has decided to have it pulled down and to

erect in its place a large block of model dwellings in flats. There will be thirty tenements, three storeys in height, each tenement being complete in itself, and having its approach from an open staircase. A large space will be left free all round the buildings to afford light and air. The buildings will be constructed with fireproof floors between the different storeys, and will be of a most substantial character. Washhouses and drying grounds have been erected in the rear.

SATURDAY was observed as the annual holiday by the building and other trades in Dundee. About 1,300 travelled by special trains *via* the North British and Caledonian Railways to the Glasgow Exhibition. Large numbers also availed themselves of the Saturday excursion trains to Perth, Dunkeld, Arbroath, &c.

ON Monday afternoon Mr. W. Grisenthwaite, of Penrith, the contractor for the erection of the new county bridge at Appleby, Westmoreland, met with an accident which it is feared may terminate fatally. He was standing on a scaffold plank superintending the work of laying the foundation of the centre pillar when the plank broke, and he was precipitated into the well beneath.

THE revival of demand in the Staffordshire iron trade has led to a further sale of ironworks for restarting at an early date. The Bromley Ironworks, Brierley Hill, which were stopped some months ago, have been purchased by Messrs. Roberts & Cooper, of Brettell Lane, who own other works in the same neighbourhood. Many manufacturers have secured large orders within the past week, and are now refusing to book anything unless a substantial advance in price is offered; while some of the pig-iron makers have no iron to offer, as customers are taking all the current make.

AT the meeting of the Ayr Town Council on Monday, it was stated that all the properties required for the projected improvements in High Street had been purchased by the Improvements Committee, at prices amounting in the aggregate to upwards of 15,000*l.* It was estimated that after selling the sites of the properties the loss to the burgh would not exceed 1,500*l.*

AT Doncaster on Saturday, the members in the Manchester district of the Institution of Gas Engineers held a quarterly meeting, when Mr. Newbiggin, of Manchester, read a paper on "Gas-holders without Upper Guide Framing," describing a recent invention by Mr. William Gadd, whereby an entirely new principle is introduced, and by the application of which a

gasholder may be securely guided from the bottom curb, the whole of the elevated framing being done away with, whilst at the same time the strain of wind or snow pressure upon the holder has the effect of producing greater rigidity in the structure.

ESTIMATES, amounting to about 4,300*l.*, have been accepted for the erection of Town Hall buildings in Lockerbie.

THE profits on the gas and water undertakings of the Carlisle Corporation amount for the past year to 8,337*l.* and 4,338*l.* respectively, making a total of 12,675*l.*

UPWARDS of 2,300 miles of main for conveying natural gas have now been laid in the United States. The total capital invested in the business exceeds 50,000,000 dollars.

THE *South-Eastern Gazette* says:—A deputation of the residents in the vicinity of the Butter Market, Canterbury, last week waited upon the Markets Committee to ask that it may not be abolished. One gentleman present said he would be prepared to guarantee anything which might be spent in excess of 5*l.*, a sum which the deputation were confident would amply suffice to carry out the needed work. It would appear from a pamphlet printed in London, 1666, that Mr. John Somner, brother of William Somner, the antiquarian, at an expense of 400*l.* and upwards, "erected and completed a market-house (a piece of such elegance as much commends the architect), consisting of a double storey, divided into two fair rooms apiece, with a pavement of stone underneath, very useful for walking out of market time." The place was called the bulls' stake (from baiting bulls there). In 1789 the building over the butter market, which had been many years used as a theatre, was pulled down, many of the timbers being much decayed, and another building erected by the Corporation, at the expense of 45*l.* In 1821 it was again repaired, and entirely new roofed.

ON Saturday, August 25, a section of the employes of Messrs. Gregory & Co., Station Works, Clapham Junction, held their annual excursion and dinner, leaving Clapham Junction by an early train for Portsmouth. They spent the morning in visiting the Dockyard, Southsea, and other places of interest, and mustered for dinner at Maybon's restaurant. Mr. G. C. Hudson (one of the partners) presided at a very well served dinner, after which the usual toasts were honoured. Mr. Hudson, in reply to the toast of the firm, hoped that the good feeling between all parties, so evident this day, would increase day by day, and not be confined to special occasions

like the present, and that each succeeding meeting might, if possible, find the interest of all connected with the firm more firmly cemented. The party, numbering about a hundred, left Portsmouth at 2.15 P.M. for the Isle of Wight, returning to Clapham Junction *via* Portsmouth, reaching home about 10 o'clock, after having spent a thoroughly enjoyable day.

#### THEATRE ROYAL, YORK.

THE structural alterations designed by Mr. E. G. Mawbey to secure the building against the dangers of panic and fire are being carried out. The pit and gallery were formerly entered from Duncombe Street, but these entrances will be removed, and in future all parts of the building will be entered from St. Leonard's Place. The pit, instead of being entered on the right of the orchestra as formerly, will in future be entered from the back, just under the middle of the dress-circle, the entrance being 12 feet wide. Stairs corresponding to those used for the entrance are constructed on the left side of the door, having been provided as an extra means of exit in case of emergency, which clears on the left of the front of the theatre. The exits now in course of construction will enable the pit to be cleared within two minutes from an alarm being raised. The dress-circle is reached by a wide staircase. On the right of the stairs-landing will be provided a gentlemen's smoke-room and lavatory, and behind that room one of much larger size will be set apart as a ladies' cloak-room, with lavatory and every other accommodation provided. A promenade will be formed just outside the dress-circle. The portion of the building formerly used as a dwelling-house has been completely removed to make room for the staircase leading to the dress-circle and the stairs which ascend to the upper boxes. A promenade will also be formed for the accommodation of the patrons of the upper boxes, and on this landing will also be provided cloak-room, lavatory, and other requisite accommodation. On the right side of the building, and not far from the cloak-room, an emergency exit will be made, leading into the gallery staircase, thus providing two exits, which it is calculated would enable the gallery to be cleared in one minute.

The "green rooms" will be rearranged, the old gallery staircase will be abandoned, and a corridor constructed running along the front of the green rooms, and an emergency exit for the performers has already been provided, so that they can get

clear out in a minute, the means of exit being such that they will not come into collision with persons leaving any part of the building. In addition to these, emergency exits will be provided on each side of the stage, and a special exit for the orchestra. In addition to these improved means of entrance and exit, other alterations are being made in the interior. The dress-circle will be refloored with a fireproof flooring. Underneath the dress-circle formerly was a crypt, consisting of a series of arches with short Norman pillars, partly hidden by modern brickwork. This is believed to be a portion of the remains of St. Peter's Church, which was destroyed by fire in 1137. Previously the pit extended only to the front of the dress-circle, but it is now being extended underneath the dress-circle, new iron pillars having been erected. Timbers will go across from one pillar to the other, and the cross beams will be placed in the wall, extending to the front, thus carrying safely the dress-circle. Accommodation will thus be provided in the pit for about 150 more persons, and the floor will be raised at the back so that all spectators will have a good view of the stage. Much of the old crypt still remains, every desire having been manifested not to disturb those relics of the ancient past. The whole of the alterations were designed by Mr. Mawbey, and as he is adverse to winding staircases, the whole of those being constructed are straight steps, and landings formed of hard Yorkshire stone. The whole of the staircases will be fireproof, and the dress circle and upper boxes will be fitted with glass doors and Chubb's patent safety fire doors. The contractors for the work are Messrs. Parker & Sharp, of York, and Mr. Wm. Jenkinson is employed as clerk of works.

Councillor Dr. Ewart, Dr. Newsholme, Messrs. Yates, Ward, Wells, Jolliffe, D. T. Bostel, E. Roberts, D. B. Bostel, Richardson, Lintott, and Harmer. The rules of the Glasgow district were adopted, and the offer of Mr. Councillor Loader for the use of his offices for the company was accepted with thanks. The secretary was authorised to call the Registration Committee on September 7 to consider applications. It was decided to hold public meetings at Lewes, Chichester, Hastings, Eastbourne, Horsham, East Grinstead, Tunbridge Wells, Worthing, and other towns if invited. After the regular business some of the members expressed dissatisfaction with the way gasfitters were allowed to operate on water-pipes, and it was thought that the Waterworks Committee should only allow registered plumbers to tamper with their service, as was the case with the New River, East Kent, and East Middlesex Companies.

#### THE WENHAM LAMP.

FOR some time back, the *Aberdeen Free Press* says, the directors of the Music Hall Company have contemplated an improvement in the gas lighting of the Music Hall Buildings, and recently an interesting experiment was successfully carried out in the lighting of the large hall on the Wenham regenerative gas lamp system. As a preliminary experiment, Messrs. James Milne & Son, of Edinburgh and Glasgow, Scottish agents of the Wenham Company, were commissioned to fit up one of the large-sized Wenham regenerative lamps in the round room. The results, both as to consumption of gas and effective lighting, were considered so satisfactory that the directors requested Messrs. Milne to report as to the adaptability of the Wenham lamp for the general lighting of the Music Hall itself. The plan submitted by Messrs. Milne was the substitution of three groups of Wenham lamps to replace three sunburners at present in use, and it was the first group of lamps that had just been erected in place of the sunburner at the platform end of the hall that was then experimented with. The group, which was fitted into the space over the platform occupied by the sunlight, consists of seven lamps, enclosed in globes similar to those in railway carriages, and resting on an iron fretwork frame, which, however, is invisible from the hall. Each lamp is supplied with flash light tubes, and the lamps are simultaneously lit by turning on a single tap in the gallery. The difficulty hitherto experienced of providing

#### REGISTRATION OF PLUMBERS.

A MEETING of the District Council for Sussex in connection with the National Registration of Plumbers was held at Brighton recently, the chair being occupied by Dr. Ewart, chairman of the Sanitary Committee. The questions of advertising the meetings and registration were gone into by the meeting, and after a prolonged discussion, a resolution empowering the secretary to advertise throughout the country was adopted; afterwards a second resolution to the effect that an arrangement be entered into with the Worshipful Company similar to that entered into with other District Councils was carried unanimously. The following gentlemen took part in the discussion:—

### BEAN'S PATENT DIRECT-ACTING VALVELESS WASTE-PREVENTING CISTERNS.

These Waste-Preventers are simple in construction and rapid and powerful in action. The working parts have been improved and are well balanced. The arrangements for charging the siphon are such that a slight pull by hand is all that is necessary to cause the immediate and automatic discharge of the contents of the Cistern.

THE CHIEF ADVANTAGES are—(1) the direct acting method of charging the siphon, by which the full flush is obtained at once; (2) simplicity of construction; (3) no valve in the bottom of the cistern to cause leakage; (4) no tight-fitting parts to corrode or get out of order; (5) no waste incurred by fastening the "pull"; (6) insures a rapid and regulated flush without holding down the pull.

2 NEWGATE STREET, LONDON, E.C.

a ready means of manipulating the lamps in such a lofty interior has in this case been successfully overcome, an ingenious apparatus having been devised by the Messrs. Milne, by which the whole group can be easily lifted for cleaning or repairing purposes. The seven lamps tested are of the largest size, No. 4, and consume each 15 feet of gas per hour, a little over 100 feet in all. The sunlight thus superseded contained 297 burners, and consumed fully 400 feet of gas per hour, so that the saving involved by the adoption of the new system is thus some 75 per cent. Several of the directors of the Music Hall Company, along with Mr. Smith, gas engineer, were present in the hall when the new lamps were tested, and expressed much satisfaction at the result of the experiment. A most effective light was obtained, the brilliancy of the concentrated jets being greatly admired, and the lights being 45 feet above the floor line look from below not unlike a group of large electric lamps. It is probable that the other sunburners will also be replaced by the Wenham lamps.

#### GILCHRIST ENGINEERING SCHOLARSHIPS.

AN entrance scholarship will be offered at University College, London, in the present month. The value is 35*l.* per annum, tenable during two years, and the competition is limited to those who have not previously been students of the college, and who will not complete their nineteenth year before October 1. Every candidate must declare his intention of taking, at least, the two first years of one of the engineering courses, and the second payments will depend upon his success during the first year and the arrangements he makes for the second year's study. The subject of the examination will be mathematics, and any two or more of the following five subjects:—Mechanic, mechanical drawing, an essay on a given subject, French or German, and the use of tools. A senior scholarship of 80*l.* will be awarded at the close of the session. Candidates must have attended college classes in the following subjects during the whole of the session:—Applied mathematics, physics, engineering, engineering drawing, and geology. The results of the class examinations will decide the obtainment of the scholarship, providing sufficient merit has been shown to justify the award. There are also entrance and other exhibitions and scholarships given at University College for mathematics, physics, chemistry, classics, German, French, art, Greek,

Hebrew, jurisprudence and political economy, philosophy of mind and logic, English literature, medicine, surgery, pathology, and physiology.

#### PROPOSED NEW DOCKS ON THE DEE.

IN reference to an announcement that the London and North-Western Railway Company contemplated constructing docks on the Dee, it has been ascertained that this action is taken in opposition to the Manchester Ship Canal. Ships of the heaviest tonnage can cross the bar of the Dee, which is several feet deeper than the Mersey bar, and can steam right up to Mostyn, a distance of ten miles only, where the new docks will be built. There is now a very fair port at Connah's Quay, fourteen miles further along the Dee, in the direction of Chester; but the state of the navigable channel is so bad, owing to sand banks and accumulations, that the shipping interests are much jeopardised. The main line of the London and North-Western Railway from Chester to Holyhead runs within a hundred yards of the proposed docks, and the contention by the railway interest is that ships can be unloaded at Mostyn right on to the railway, and the goods be in Manchester in two hours. Holyhead, where the company already has docks, would not suit, for there is not more than adequate accommodation for their rapidly developing Irish traffic.

#### AN ELECTRIC MOUNTAIN RAILWAY.

THE *Daily News* gives a description of the electric mountain railway—the first of its kind—recently opened to the public at the Burgenstock, near Lucerne. The fact is interesting to tourists because it opens up a charming mountain resort hitherto somewhat inconveniently approached, and it is important because of the novelty and skill which have entered into its accomplishment, and because of the difficulties which have been surmounted. Hitherto it has been considered impossible to construct a funicular mountain railway with a curve, but the new line up the Burgenstock has achieved that feat under the superintendence of Mr. Abt, the Swiss electrical engineer. The rails in fact describe one grand curve formed upon an angle of 112 degrees, and, by an arrangement of wheels for the cars known as the "System Abt," the journey is made as steadily and smoothly as upon any of the straight

funiculars previously constructed. The Burgenstock being almost perpendicular, it would have been impossible to construct a railway upon the old plan. A bed has been cut for the most part out of the solid rock in the mountain side from the shore of the Lake of Lucerne to the height of the Burgenstock—1,330 feet above its level, and 2,860 feet above the level of the sea. The total length of the line is 938 mètres, and it commences with a gradient of 32 per cent., which is increased to 58 per cent. after the first 400 mètres, and this is maintained for the rest of the journey. A single pair of rails is used throughout, with the exception of a few yards at half distance to permit the two cars to pass.

The motive power, electricity, is generated by two dynamos, each of 25 horse-power, which are worked by a water-wheel of 125 horse-power, erected upon the river Aar at its mouth at Buochs, three miles away. The electric current is conducted by means of insulated copper wires to another pair of dynamos, the negatives of the first, and of the same power, which are installed at the head of the railway. The loss of electricity in transmission is estimated at 25 per cent. The electric force thus obtained is converted into mechanical power with ordinary leather belting, passed to two large driving wheels, then extended by shafting to a set of movable conical cogs, and thence to the big wheel, over which the wire-rope passes. To give the rope adhesion it is wrapped under and over two smaller pulleys, and then for a second time over the larger wheel. Greater steadiness to the cars is at the same time achieved. The arrangements for applying the power are of the simplest character. Only one man is required to manage the train, and the movement of the cars is completely under his control. One dynamo is sufficient to perform the work of hauling up and letting down the cars containing fifty or sixty persons. With a "switch" the conductor regulates the amount of electricity according to his requirements, a gauge similar to the steam gauge of an ordinary boiler, and figured in horse-power, being provided for his guidance. He communicates by electric signals with the man at the water-wheel when the cars are about to commence their journey, and the latter in turn regulates the water-power applied. To prevent jerking or an "over-dose" of electricity, the current passes through a large "case" or "accumulator" placed in the machine-room, and from this the "driver" draws his supply as required. A finger moving along a figured disc before him by means of a millimètre screw at the rate of a millimètre to every mètre of the railway, and one per second—the speed at which the cars run—enables him

to see their exact position on the line at any given moment of the journey, and he can increase or slacken speed accordingly. In addition to this advice, the cars themselves give him a signal at stated points. At a distance of one mètre and fifteen mètres respectively, after the car leaves either the upper or the lower station, the flanges of the wheels pass over an electric plate, and a bell is rung in the machine-room. The same signs are given when they arrive within fifteen mètres and one mètre of the half distance, so that the cars are themselves their own signalmen, and the "driver" knows exactly when to "shut off power." At the end of the journey, completed in about fifteen minutes, at an ordinary walking speed, the car moves gently against a spring buffer, and is locked by a lever, without noise and without jolting the passengers.

The undertaking has been carried out at a cost of 25,000l. The electric power gained at the stream by the water-wheel also lights the whole of the hotel buildings and its grounds by electricity, and when the railway is not working, another dynamo pumps up spring-water 1,000 feet for use in the establishment.

### BRIGHTON AS A HEALTH RESORT.

A PAPER on the sanitary advantages of Brighton was read by Dr. Joseph Ewart, the chairman of the Sanitary Committee of the Brighton Town Council, on Saturday, at the meeting of the sanitary inspectors. The first fundamental advantage the town possessed, he said, was the unrivalled site upon which it was built; it was endowed with so many physical virtues and was impaired by so few defects. It had an admirable fall for drainage. The central parts of the town possessed an alluvial and marly soil, but for the most part there were no buildings erected on it, the main space being devoted to recreation grounds. A chalk basis was to be found east and west of this point, and in consequence the climate was comparatively dry and bracing. The town was greatly benefited by the absence of any low-lying, oozy, or swampy ground in the immediate vicinity; the Downs to the north, the shingle and cliffs to the south; the standing north of the town on chalk cliffs, approaching more or less closely the beach and sea; a southerly or south-westerly aspect, courting an ozone and health-laden prevailing breeze; an unusually large proportion of sunlight, especially during the season, from October to December inclusive, when the metropolis and many of our great inland

cities are liable to be enveloped in smoke and fog; a moderate mean annual temperature of 50 deg.; greater coolness in summer and warmth in autumn than that of inland towns; a moderate thermometric range of 11 deg.; a rainfall of only 28.87 deg.; a barometric pressure of 29.961 deg., with a range of 2.381 deg.; a humidity of 82 deg., saturation point being put at 100 deg.; very few days in the year in which exercise may not be taken in the open air on the well-paved side walks and promenades. The splendid water supply which the town possesses was next instanced, and it was shown that this was apparently boundless. The population to be provided with water amounted to over 141,784 souls, which, allowing a daily expenditure of 24 gallons a head, would account for 3,402,716 gallons. As regards quality, analysis had shown that Brighton water was absolutely free from organisms, ammonia, and sewage contamination, and possessed "low values of carbon and nitrogen, and just sufficient hardness to give it a pleasant taste." The third advantage Dr. Ewart claimed for the town was its excellent system of drainage and its efficient sanitary department. The whole of the sewage of Brighton, Preston, and Hove was conveyed by means of well-constructed sewers into an intercepting sewer, which had its outfall four miles to the east of the most easterly part of the town, the ventilation of which was promoted by a furnace and shaft at Roedean. In dry weather 4,000 gallons of water were used for flushing purposes. Brighton possessed a fourth advantage in its steadily diminishing death-rate, the figures of which he adduced. The general advantages the town possessed in its unrivalled esplanades, its numerous attractions, its parks and open spaces were also enumerated; and after dwelling upon the necessity of establishing abattoirs and other matters, he concluded:—Brighton, it must be recollected, is purely and simply a great health resort. It is desirable, therefore, that her vital statistics should enable her to compare favourably with other health resorts. Her eminently happy and proud place among the twenty-eight large towns with which she has been bracketed, is satisfactory as far as it goes, but it is not quite sufficient to satisfy the scientific critic. In such a matter this gentleman cannot be disregarded. What is really required, he naturally declares, to secure the town against all risk and to make her prosperity certain and perennial, is, by an extension of sanitation in the direction indicated, to confer upon her a corresponding pre-eminence over her genuine rivals in this country and elsewhere. That this can be done has been amply proved by the advance which has been made during the last half a dozen years.

## METROPOLITAN RAILWAY.

THE company are about to rebuild the St. John's Wood Station at Baker Street, and also to widen and enlarge the old station in Marylebone Road, Baker Street. The works will involve the temporary stoppage of the road, to which the Vestry have consented in order to enable the contractor to place the iron girders carrying the roof in position. This portion of the works is expected to be completed in about a month. The old station is to be widened on both platforms, by which the passengers from the Rickmansworth branch, instead of having, as they now do, to traverse the whole of the building, will merely walk through a short passage into their train. An additional bridge will also be thrown over the station to connect the St. John's Wood line with the west end side of the station, and passengers to the City trains will be given greater facilities for reaching their destination by the widening of the up-platform.

## NEW THEATRE, LONGTON.

AT a special sessions of the Longton justices on Tuesday, Mr. G. C. Kent appeared on behalf of Mr. James Elphinstone, and applied for a license for the performance of stage plays, &c., in the new building now approaching completion, and to be known as the Queen's Theatre. He said that from the plans to be submitted it would be seen that the theatre consisted of a basement containing the dressing and other necessary rooms underneath the pit and the stage-well, and also the pit bar, leading by a broad staircase to the pit overhead. The pit itself was a large one, placed upon a fireproof floor composed of iron girders and solid concrete. It would be almost impossible for a fire to take place in the pit, or, in fact, in any part of the auditorium, the object of the promoters having been not so much to put out fire quickly as to prevent its occurrence altogether; and that object had been carried out as far as practicable. There was a wide entrance to the pit, and other convenient arrangements, for by the doors in Chancery Lane it was possible to throw nearly the whole length of the pit open by the use of a lever, so that it could be cleared in a very brief space of time. In front of the ordinary pit there was a number of stalls to which a separate entrance was provided, and, in case of panic, the occupants would be able to get into the street immediately. Over the pit were the circle and upper circle,

and at the top of the house was the gallery, each provided with a stone staircase. In fact, all the inside staircases, with the exception of that in the grand entrance, where little or no risk was apprehended, were composed of stone. There were two entrances to the circles, and a separate entrance to the different galleries; and, in addition to the entrances, there were means of exit above the requirements of the theatre. The staircases alone would contain all the people the theatre would accommodate, which was a very important feature, because in case of a panic the stairs could hardly become so congested as to leave a number of people in the body of the theatre. All corners in the stairs had also been rounded, so that no person might get stuck in one of them. The magistrates decided to grant the license. The theatre has been erected from the plans of Mr. John Taylor, architect, Longton, by Mr. T. S. Bromage, builder, Longton, the contract price being 12,000*l*. Accommodation is provided for 3,000 persons.

### TRADE IN AMERICA.

A STATISTICAL report for 1887 has been prepared by Mr. David T. Day, Chief of Division of Mining Statistics and Technology of the United States, from which the following is taken:—

**Building Stone.**—Direct returns from producers show a total value of 25,000,000 *dols.* This marked increase shows that the statement for 1886 was too small.

**Brick and Tile.**—Value 40,000,000 *dols.* This represents an increase of about 13 per cent. in the production of brick and a decrease in tile, owing to the drought in 1887 in Indiana and Ohio. Prices were slightly lower.

**Lime.**—The production is estimated at 46,750,000 barrels, with an average value of 50 cents. per barrel.

**Cement.**—The production of cement from natural rock was 6,692,744 barrels, valued at 77½ cents per barrel, making 5,186,877 *dols.* as the value of the year's product.

**Iron.**—Domestic iron ore consumed, about 11,300,000 long tons; value at mines, 33,900,000 *dols.* This is an increase over 1886 of 1,300,000 tons in quantity and 5,900,000 *dols.* in value. Imported iron ore consumed, 1,194,301 long tons; total iron ore consumed in 1887, about 12,494,301 long tons, or 1,454,868 tons more than in 1886. Pig-iron made, 6,417,148 long tons; value at furnace, 121,925,800 *dols.* This is

an increase over 1886 of 733,819 tons in quantity and 26,730,040 *dols.* in value. Steel of all kinds produced, 3,339,071 long tons, an increase of 776,569 tons over 1886; value at works, 103,811,000 *dols.* Total spot value of all iron and steel in the first stage of manufacture, excluding all duplications, 171,103,000 *dols.*, an increase of 28,603,000 *dols.* as compared with 1886. Limestone, used as flux in the manufacture of pig-iron in 1887, about 5,377,000 long tons; value at quarry, about 3,226,200 *dols.*

**Gypsum.**—The condition of the industry is practically unchanged. The estimated total product was 95,000 short tons of crude gypsum, valued at 425,000 *dols.* In addition, 162,154 long tons of crude gypsum were imported, chiefly from Nova Scotia.

**Flint.**—For pottery, 19,800 tons were used. Including the use for sand-paper and in glass manufacture, the total consumption was about 32,000 tons—worth, unground, 185,000 *dols.*

**Potter's Clay.**—The consumption of kaolin and ball clay by potters aggregated 28,000 tons, valued at 290,000 *dols.* In addition, the potters used 15,000 tons of fireclay, worth 50,000 *dols.*

**Mineral Paints.**—Including ochre, metallic paints, and small quantities of umber and sienna, the production amounted to 20,000 long tons, selling for 310,000 *dols.* at the mines.

### PROPOSED BRIDGE AT NEW YORK.

A SUSPENSION bridge is proposed to be built by Mr. Gustav Lindenthal, bridge builder, of Pittsburg, Pennsylvania, for railway traffic and other purposes, across the Hudson River between New York City and the north New Jersey shore. The Bill has been introduced in both Houses of Congress. According to the plans the bridge will cross the river in a single span, 2,860 feet in length. This is 1,250 feet longer than the largest span yet known (the Forth Bridge, which has two spans each 1,710 feet long), and exceeds that of the Brooklyn or East River Bridge by 1,310 feet. The structure will be similar in its main features to the East River Bridge, except that there will be double cables, one set below the other. There is to be a double tower on either side of the Hudson, with a single span suspended from cables. The length of the middle span is to be, as stated, 2,860 feet from centre to centre of the towers,

### GRUNDY'S PATENT WARM-AIR VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, classrooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

#### TESTIMONIALS.

9 Victoria Chambers, Westminster, S.W.  
SIR.—I have much pleasure in testifying to the efficiency of your patent warm-air fire-grate. It has been very successful, and given every satisfaction where I have used it.

Yours, &c., JAMES WEIR, F.R.I.B.A.,  
6 John Street, Bedford Row, W.C.

From ARTHUR W. BLOMFIELD, M.A., Esq., Architect,  
28 Montagu Square, London, W.

Mr. Grundy, of Tyldesley, near Manchester, has carried out his plan of warming in several churches built under my direction, and in each case it answers remarkably well, and has given great satisfaction.

From Professor W. B. ROBERTSON, M.D., West Dulwich, S.E.,  
September 1, 1887.

DEAR MR. GRUNDY.—I value your apparatus very highly indeed. I regard it as the greatest comfort I have in this house.

From Rev. A. FERGUSON SMYLY, Dean of Derry, The Deanery,  
Derry, September 16, 1887.

DEAR SIR.—I cannot refuse to give you a few words of commendation as to the apparatus you supplied for heating Derry Cathedral. Not only is the air of the Cathedral quite pure and pleasant to those attending the services, as it must be from the fact that most of the air heated is taken from the outside, but I find the building itself is so much benefited, as formerly it was damp and smelt damp, but now it is very dry and free from any musty smell. I find that, although the Cathedral is now much larger, the cost of firing is much less.

To Mr. John Grundy, 30 Duncan Terrace, City Road, London.

From Hon. and Rev. G. G. C. TALBOT, M.A., Withington,  
Cheltenham.

DEAR SIR.—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.

Mr. John Grundy.

STONE FIRMS.

and the length of each of the end spans 1,500 feet, making a total, including the anchorages, of nearly 6,500 feet. The towers are to be 500 feet high, and to stand on masonry piers 340 feet by 180 feet, reaching 25 feet above high water, with foundations on rock. The towers are to be of wrought-iron and steel, and to consist of sixteen columns each. These columns are to be constructed of angles and plates; they will be octagonal in shape, and tapering from 7 feet in diameter at the base to 5 feet at the top. The columns are to be strongly braced together inside by heavy bracing, and outside by lattice filling. The anchorages are to be each 320 feet by 180 feet, and 210 feet above high-water line. Six tracks of railway are to pass over the bridge, and through a tunnel in each anchorage. The cables are to be 50 feet apart, and strongly braced together to resist the deforming effects of heavy loads. Each cable will have a diameter of 4 feet. The steel wires forming the cables are to be enclosed in steel envelopes to protect them against the weather. An air space of 2 inches is to be left between the steel envelopes and the wire for the better protection against heating by the sun, and to prevent unequal temperature effects. For ordinary traffic the proposed bridge, it is estimated, would be strained only to about 10 per cent. of the maximum load for which it is designed. The elevation of the span above the level of ordinary high water would be 140 feet in the clear, exclusive of the deflection of the superstructure from loads or the effects of temperature.

## PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Cassell, Consulting Patent Agents, 43 Southampton Buildings, Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

## APPLICATIONS FOR PATENTS.

11889. Ellen Wilkinson, for "An improved window fastener." August 17, 1888.  
11896. Moses Piper, for "Improvements in instruments for measuring angles." August 17, 1888.  
11908. Walter Stock, of the firm of Stock, Sons & Taylors, for "Improvements in flushing water-closets, urinals and other places." August 17, 1888.  
11909. James William Tyler Stephens and Robert Clark,

for "Improvements in the manufacture of Portland cement." August 17, 1888.

11954. W. T. Elliot, for "Saving life from fire." August 18, 1888.  
11961. J. Sleigh, for "Improvements in grids or stretch traps for streets, &c." August 18, 1888.  
11994. J. Cundall, for "Damp-proofing for walls and foundations of buildings." August 20, 1888.  
11991. J. W. Saunders, for "Improvements in racks for window-blind cords." August 20, 1888.  
12055. C. K. Steane, for "Improvements in window sashes and frames." August 21, 1888.  
12061. Miles Smith, for "Improvements in chimney-tops, pots and cowl." August 21, 1888.  
12107. J. H. Bean and W. Gaines, for "Improvements in apparatus for closing doors and preventing slamming-to of the same." August 22, 1888.  
12141. James Pike, for "Producing and repeating automatic flush." August 23, 1888.  
12173. Charles Young, for "An automatic bolt for double doors." August 23, 1888.  
12182. Richard Stephens and William Charles Stephens, for "Improvements in apparatus or machinery for drilling rocks and other hard substances." August 23, 1888.  
12188. Thomas Cain, for "Novel means and appliances for economising fuel and for increasing the heating properties of the products of combustion in furnaces; also for preventing the escape of black smoke." August 23, 1888.  
12192. Theophilus Lessy Hargreaves, for "An improved safety window fastening." August 23, 1888.

## PROVISIONAL SPECIFICATIONS ACCEPTED.

4123. Alfred James Little, for "An improved system of drainage and flushing." March 17, 1888.  
7883. James Harold Barry, for "Materials for use in the purification of sewage." May 30, 1888.  
9288. Hugh Lyons, for "Improvements in polishing or enamelling and ornamenting wood, cement, and other substances." June 26, 1888.  
9803. Alfred James Hogan, for "An improved method of building and construction, to facilitate escape from fire." July 5, 1888.  
9832. Joseph Cordingley Wilson, for "Improvements in ventilating cowls or shaft tops." July 6, 1888.  
10177. Joseph Samuel Horton, for "Improvements in raising

and supporting Venetian blinds, and other similarly accumulating weights." July 13, 1888.

10550. John Pullar, for "Improved safety lock-fast gear for actuating fanlights." July 21, 1888.

11029. Ann Knevet, for "Improved apparatus to be used in connection with domestic firegrates." July 31, 1888.

11155. Arthur Hugo Harrison, for "Improvements in such shovels as are used for removing fluid matter from one place to another." August 1, 1888.

11372. Thomas William Aylesbury and James William Russell Wall, for "Improvements in service and cistern cocks for automatically preventing the waste of water." August 7, 1888.

#### COMPLETE SPECIFICATIONS ACCEPTED.

Notice is hereby given, that all persons interested in opposing the grant of a patent on any one of the undermentioned applications may, at any time within two months from the date of this journal, give notice at the Patent Office in the prescribed form of such opposition.

12379. James Duckett and Alfred Duckett, for "Improvements in and relating to waterclosets using waste or slop water." September 13, 1887.

13180. John Hargreaves, for "Improvements in the manufacture of cement." September 29, 1887.

13193. John Martin Stanley and Thomas Blakemore Stanley, for "Improvements in the structural means for extinguishing and preventing the spread of fires in theatres and other buildings." September 29, 1887.

13740. Claude Marius Duplany, for "Improvements in and connected with fireproof curtains for use in theatres and other similar buildings, and in the construction of such buildings for preventing the spread of fire and smoke therein." October 11, 1887.

14281. James Bazeley Petter, for "Improvements in fire-places." October 20, 1887.

14431. John Walter Gibbs, for "Improvements in exit-ventilators for rooms and other places where down-draughts are to be avoided and noiselessness is a desideratum." October 24, 1887.

6995. James Johnston, for "Improvements in hot-air stoves." May 10, 1888.

10358. William Robert Lake, for "Improvements in heating apparatus for dwelling-houses, factories, and the like." July 17, 1888.

#### PATENTS SEALED, AUGUST 24, 1888.

9815. Alfred Hamilton and Douglas Hamilton, for "An improvement in cowls or wind-guards." July 12, 1887.

10493. Henry Alonzo House and Henry Alonzo House, jun., for "Improved combined door-spring and buffer, applicable also to shutters and the like." July 28, 1887.

10858. John Gill, for "Improvements in machinery or apparatus for the manufacture of pottery, pressing bricks, and the like." August 8, 1887.

11509. Henry Warrington and William Willshaw Howlett, for "Improvements in bricks and other blocks for building purposes." August 24, 1887.

#### NOTES ON SPECIFICATIONS RECENTLY PUBLISHED.

"Improvements in condensation gutters, metal weatherings, and doorstep plates." No. 5548. 1888. R. A. English, builder, London Road, Stroud. An invention concerning the manufacture of metal gutters for collecting the condensation water from interior of windows, doors, and the like, and conveying the same by means of metal tubes to the outside. This invention also applies to roofs glazed by "The Don" system, and to a combined weather step-plate, a draught stop-gutter and linoleum fastening.

"Improved apparatus for forming manholes and other openings in metal plates." No. 9507. 1888. Peter Mitchell, Greatham Terrace, West Hartlepool. This invention relates to the improved means for facilitating the formation of manholes and other openings in boiler, tank, and other metal plates.

*Claim 1.*—Apparatus for forming openings in metal plates, comprising a knife or punch and a block or die, which are adapted to be rotated to cause the knife or blade to correspond with the margin of the hole to be cut, the said knife or blade having a projecting portion extending into a hole or slot in the block, so that the latter shall move with the knife or blade for the purpose specified.

"Revolving door post or other revolving posts for public buildings and theatres." No. 13258. 1887. W. H. Dutton, Englefield House, 258 Oxford Road, Gunnersbury, W.

*Claim 1.*—Revolving posts that can be fixed to doorways, corridors, passages, newels of staircases, or other places of ingress or egress of public or private buildings.

TO INVENTORS. — Patents for Inventions, Trade-marks, and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CASSELL, Patent Agents, 43 Southampton Buildings, Chancery Lane.

# FIRE! FIRE! FIRE!

## GRIFFITHS' "PYRODENE" FIREPROOFING LIQUID

(NON-POISONOUS).

Transparent Liquid for Rendering Woodwork Uninflammable,

Without altering its appearance, and where Painting is not desired, such as Wooden Fittings in Exhibitions, Churches, Pews, Matchboarding, Theatre Scenes, Wooden Stairs, Joists, Beams, Floors, Factories, Stables, Mills, &c., in fact, Structures of an inflammable nature of all descriptions. Acts as a priming for new Woodwork for Paint or Varnish. Also for rendering Theatrical and Ball Dresses, Curtains, Paper, Felt, Canvas, &c., perfectly uninflammable.

Griffiths' Liquid penetrates the pores of the wood. It lasts as long as the wood itself. It prevents Dry Rot and decay in house timbers. It does not crack, peel, or rub off.

It is perfectly innocuous and free from smell. It will keep any length of time. Any one can apply it. One gallon will cover double that of any other priming.

All Woodwork in new houses should be fireproofed with this liquid, the cost is so trifling in comparison with the preservation of the timber and freedom from risk of fire. If work is desired to be painted afterwards, Griffiths' Pyrodene Paint is best for the purpose.

AND

## GRIFFITHS' "PYRODENE" FIREPROOF PAINT.

READY FOR USE. NON-POISONOUS. ALL COLOURS.

This Paint is manufactured for preservative and decorative purposes equally as for its FIRE-RESISTING qualities. The Fireproof Paint and Fireproofing Liquid is used at some of the principal Theatres in the United Kingdom.

### RECENT TESTIMONIALS.

From Messrs. MAXWELL & TUKE, Architects, 29 Princess Street, Manchester: December 28, 1887.

DEAR SIRs.—We used your Paints in nearly the whole of the works for the Royal Jubilee Exhibition, and with very satisfactory results.

Yours truly, MAXWELL & TUKE.

To Messrs. Griffiths Bros. & Co., Dashwood House, London, E.C.

From S. C. LOWE & SON, House Decorators, 32 Cavendish Street, Stretford Road, All Saints, Manchester: November 22, 1887.

DEAR SIRs.—In reply to your inquiry, we, as one of the contractors for the painting of the Manchester Jubilee Exhibition, which closed on the 10th of this month, have pleasure in stating that both your "Aqual" Paint, and also your "Pyrodene" Fireproof Paint, have given great satisfaction. We found them work easily with a covering power of from 30 to 40 per cent. over ordinary paint. Although applied during intense frost, and having been subjected to an almost tropical summer, followed by the drenching rains of this autumn, they are as fresh in colour and have as firm a grip as when applied, and appear quite unaffected by the nine months' exposure. We consider them, therefore, well adapted for all work in any climate.—Yours truly,

To Messrs. Griffiths Bros. & Co., London.

S. C. LOWE & SON.

CHEAPER AND MORE DURABLE THAN ORDINARY PAINT.

# The Architect.

## THE WEEK.

A LONG experience as a witness in law courts and Parliamentary Committee-rooms has developed Sir FREDERICK BRAMWELL'S power of exposition, and now he has few rivals as a public lecturer. His address as President of the British Association on Wednesday was a masterpiece in its way. Remembering the rank of many of his predecessors in the chair, and how often they startled the world with announcements of discoveries, Sir FREDERICK with his usual tact proposed to talk about "The Importance of the Next to Nothing," and that subject might be said to lead to the "Eulogy of the Civil Engineer," who has so often utilised materials of which the value would be described by a cipher. It will be observed that in talking of the standing engineering works the President placed "buildings" in the foremost place. He did not define their class; but if they are of the customary railway-office type, Sir FREDERICK might well put them under the "Next to Nothing" category. The poetry of engineering was suggested in regard to lighthouses and great bridges, but where is the poetry in the Cannon Street and Charing Cross sheds, which spoil two of the best of the London views?

STUDENTS of architecture who live in London cannot complain of a scarcity of facilities for increasing their knowledge, and the fees to be paid could hardly be lower. For two and a half guineas Mr. HARVEY will give thirty lessons on the geometry of stone-cutting at the City and Guilds Institute, and the sum includes materials and tools. The value of his teaching is no longer questionable, and the students who have gone through the courses will acknowledge that construction assumes a new interest for them. Architects will find the advantage of insisting on the attendance of their pupils at the lectures. In the City of London College Mr. HENRY ADAMS and his staff will give lectures on technical drawing in relation to building, on building construction, strains in ironwork, surveying and levelling, quantity taking, and laying out estates. As in the other classes of the college, the fees are moderate, varying from 6s. 6d. to 3l. 3s. per term. Glasgow is also in rivalry with London. The programme of the Glasgow and Western Engineering College includes lectures on building construction by Mr. GOURLAY, and by arrangements which are matured it will be easy for students to join in any classes of the college which are connected with building.

AN exhibition of pastels is to be held in the Grosvenor Gallery, and it may be concluded that the art will soon come again into favour in this country. It is to be hoped that the splendid full-length portrait by M. ALFRED STEVENS which was seen last year in Brussels will be borrowed, for it is the finest pastel that was produced of late. It will be easy to obtain many examples by impressionists to whose manner of working pastel is suited, but a greater depth of colour is obtainable by artists of other schools. The fleeting nature of a pastel is exaggerated. Under glass one will last as long as a painting in oils. Sir COURTS LINDSAY should also try to obtain some of the pastels by LA TOUR and other masters and mistresses of the art in the last century.

THE Prefect of Police in Paris has issued stringent regulations for the safety of the theatres. Henceforth the control of the buildings, so far as regards precautions against fire, will be entirely in the hands of the police. The firemen, or *sapeurs pompiers*, will be on duty from two hours before the performance until one afterwards. The men will not be allowed to leave the theatre or to see any stranger during that time. On arriving, the chief of the detachment with the director or his representative will make an examination to see that all things provided to insure safety are in working order. The men will be then

placed in different parts of the house, the duty of the chief being to patrol the building. The men are to be careful to prohibit any act which might cause danger. The chief is to test the hydraulic apparatus in order to ascertain that the water is available at full pressure. After the representation there is to be a second thorough examination of the premises. Firemen and employés are to consider themselves as under the Commissary of Police and are to obey his orders. If the directions are carried out with military exactitude little danger can arise to the spectators in any of the theatres.

It is to be regretted that some of the municipal authorities in Belgium, when they were feasting our Lord Mayor, did not ask his lordship how much was expended on art by the great Corporation of London. This week a return of the city accounts has been issued. The expenditure amounts to 881,533l. 13s. 4d. Out of all that sum how much represents art? The Art Gallery is put down at 583l. os. 8d., which means the salary of the officials, and not outlay on pictures. The replica of the statue of Queen ANNE, opposite St. Paul's Cathedral, cost 936l. 10s. 6d., and thus less than one thousand pounds is all that could be afforded out of the enormous revenue of the City. The Lord Mayor should be able to draw a contrast between London and Brussels as patrons of art, and a speech on the subject from him would be a recognition of the sacrifices which are borne elsewhere in order to elevate the people.

MR. G. H. BOUGHTON, A.R.A., has agreed to deliver the prizes and to address the students of the Birmingham Municipal School of Art on February 19 of next year. Among the special lectures which are to be delivered during the session are the following:—Three lectures on "Pompeian Architecture and Art," by Mr. WHITWORTH WALLIS; five lectures on "The Anatomy and Movements of Quadrupeds, as exemplified chiefly in the Dog," by Professor BERTRAM C. A. WINDLE, M.A., M.D.; and one on "The Application of Natural Foliage to Decorative Design," by Mr. ARTHUR B. CHAMBERLAIN. During the past year, 2,398 students attended the central or branch schools of the town.

THE new number of the *Scottish Art Review* is varied in its contents this month. Two of the illustrations are taken from the Glasgow Architectural Association Sketch Book, and the selection of such subjects denotes that architecture will not be neglected by the editor. Another illustration is a reproduction of the portrait of Queen MARY of Scotland belonging to the Archbishop of Glasgow. There appears to be little doubt that the original is one of the few works of the kind which can be considered as authentic. But it serves to correct the delusions about the beauty of the Queen. A fourth illustration is from a picture by Mr. M'TAGGART, but it cannot be taken as a success. The first article is by Mr. WALTER CRANE, who maintains that under a system of socialism we should find many artists of the type of DÜRER and HOLBEIN. Mr. BALDWIN BROWN discourses on the need of "some bond which may bind artists old and young more closely together." Mr. PATERSON recommends painters to give more attention to French art. An article on the competition for the S.S.C. Library points out the bad management, and the unsuitability of most of the designs, the selection being guided by "inscrutable reasons." An impartial article on the Municipal Buildings of Glasgow ascribes the disappointment which is felt on seeing the building to the preponderance of horizontal lines, the lack of refinement in the details, the faulty fenestration, and excess of sculpture. Articles on music and literature complete a number that is nowhere dull.

A BROCHURE, entitled "Notes on Architectural Relics in Cornwall," has been brought out by Mr. H. P. BURKE DOWNING, which he is allowed to dedicate to Mr. RUSKIN. It contains many boldly-drawn sketches, plans of churches, and in the letter-press interesting notices of the buildings are given. It will be an useful companion to any tourist who intends to visit the picturesque district of Cornwall.

## GWILT'S ENCYCLOPÆDIA.\*

IT is, we believe, not easy to decide where encyclopædias in single volumes originated, but Messrs. LONGMANS can claim the credit of being the only publishers who have attempted any rivalry with the French in the production of works of that nature. Fifty years ago, when the series was contemplated, architecture was exciting some attention in England, but few publishers would venture on the experiment of producing a volume so costly as was "GWILT'S Encyclopædia" in its original form. The companion volume on "Civil Engineering" was almost as notable an example of the publishers' enterprise, for when it was commenced the work of the engineer was not defined, and owing to the impetus which came from the extension of railways in England it was almost impossible to keep pace with the development of the engineering profession. The things which were written about one day might be obsolete on the morrow. At the time of its publication there was much in "CRESY'S Encyclopædia" which appeared antiquated, and the publishers seem to have given up the hope of making the book representative of modern practice.

Architecture, on the contrary, is generally supposed to be one of those arts in which little progress can be expected. Every one who poses as an authority will be found to maintain that architecture attained perfection in one or other period of the past, and the whole duty of a student is to turn his attention backwards, as if the laws of art had been revealed once and for ever. JOSEPH GWILT seems to have had a sort of belief of that kind, and as his Encyclopædia corresponded with the art, it was to be taken as a standard that would serve for generations. He does not appear to have contemplated revisions of his volume. It contained, he said, all the knowledge that was indispensable for the practice of an architect, and from the care bestowed on its preparation many errors and defects were not likely to be pointed out. But as it is absurd to imagine that architecture, like theology, is not progressive, it would be vain to hope that any book which professed to be an encyclopædia of the art could serve for more than a limited period. From the time it was placed in the hands of Mr. WYATT PAPWORTH the "Encyclopædia of Architecture" has been subjected to many alterations, and—what would probably horrify the original author—parts have been set aside to make room for additions. The work of the editor will not be apparent to the majority of the readers of the volume, but we hope it may be indicated by means of corrected volumes and proof-sheets for the information of students hereafter. If seen in a museum it would be evident that few works have undergone so laborious a vamping.

An advertisement announces the alterations by which the new edition differs from the one published in 1876. In addition to general emendation, "the chapters on Materials used in Building" and "Use of Materials" have been partly rewritten, especially as regards fireproofing and sanitary construction. The section on "Specifications" has been recompiled and enlarged; "several sections of the chapter on Public and Private Buildings have been withdrawn." The lives of eminent architects have been brought down to date, the list of publications relating to architecture has been extended and rearranged. Additions and excisions are nearly balanced, for the new volume is only about fifty pages thicker than its predecessor. Among the sacrifices is the short memoir of JOSEPH GWILT which used to be prefixed to the volume.

It should not be overlooked when estimating the difficulties of the revision that Mr. WYATT PAPWORTH has had to deal with stereotyped plates, which are not easily altered. In the second place, the paragraphs throughout the book were originally numbered, and the addition or removal of one paragraph would entail a renumbering if another means had not been devised. In many cases additional paragraphs are marked by letters, but when some are deleted, for which corresponding substitutes cannot be introduced, it is not easy to fill up the gap. Thus in the division of the Encyclopædia which relates to history, a memorial of about 250 suppressed paragraphs is still found in this form, "627-873." We here, with regret, leave the

subject, because we have already trespassed beyond the limits prescribed—an explanation which would be as puzzling to a German as was the formula of the Courts, "Make a rule to show cause why."

It is impossible to give a history of architecture from the earliest times in the space assigned to the subject in the volume without omitting many things of great importance. The revision can hardly be said to apply to the first part. The principal additions of the editor are the dimensions, &c., of the new cathedrals of Truro, Southwell, St. Albans, also of Bath Abbey and Westminster, which extend the "tabular views" of the early editions. Judging by the section, the history of English architecture came to an end with the reign of George III. It is not, then, surprising that modern work in other countries is ignored. As regards the explorations of late years in Greece and Italy, which a historian might be expected to utilise in some way, the encyclopædists are silent about them.

In the second book, the sections on geometry and mechanics appear to be unaltered, and likewise those on piers and vaults, walls and piers. In the section on beams and pillars, the paragraphs from 1614 to 1627b in the edition of 1876 are omitted, together with the numerous tables giving the results of BUFFON'S experiments on "pieces of timber" and oak. No one will regret the loss. The experiments, it is true, were conducted with the utmost care, at the expense of the French Government; but as the dimensions were recorded in French measures, they could not be readily utilised in England. It is true they were reduced into decimals, but it would take time before one could discover the relation between a French beam measuring 17.056 ft. x 6.396 in. x 6.396 in. and any English beam of approximate size. Mr. GWILT ought to have recognised that tables of the kind were practically useless in England; but his excuse would be that they were French, for he accepted anything that a French scientist might say about construction as infallible. We suppose it must be owing to the difficulty of patching the pages that Mr. WYATT PAPWORTH felt obliged to introduce a paragraph about the effect of the weather on the Britannia Bridge in this way:—"Of all the circumstances tending to invalidate theoretical calculations the sun is about the worst"! There was no invalidation at the Menai Straits, for precautions were taken, as in all iron bridges, so as to allow the expansion; and there is no reason why an architect, if he has to employ beams that are exposed to great heat, should not also have prudence. One of the Institute examiners might talk so loosely, but Mr. WYATT PAPWORTH is supposed to be writing for the instruction of students, and should be guarded in suggesting that calculations, or, in other words, foresight, are useless, since there are circumstances to invalidate them. In the next edition we hope to find a more apposite paragraph, or a different introduction to the extract from Mr. CLARK'S book. Another piece of confusion in the new edition is seen in paragraph 1,629f, which begins with an account of rolled girders rivetted together. In it the student is informed that the constant for a plate girder with angle irons is 60, although in paragraph 1,629b the constant is given as 75. Then information is given about market lengths of rolled girders, and immediately afterwards it is stated that "the opinion is gaining ground that most of the constants in use for calculating the strength of beams are too high." This statement is enough to take away one's breath, for the numerous investigations of the strength of iron beams were supposed to impart certainty to our knowledge of iron construction. But it is soon discovered that the editor is referring to timber beams. Apparently, in filling up the pages, a paragraph that rightly belongs to some other part was inserted because it happened to fit, size not relevancy being the desideratum. An addition to the section is upon the use of steel in building, and tables by Mr. DAWNAY and Mr. MORELAND will suggest the relative strengths of rolled iron and steel joists.

In the chapter on stone there is a detailed description of the stones belonging to the Bath Stone Firms, Limited, and of others which are now in favour, such as Ancaster, Chilmark, Spinkwell, Minera, &c. No new means would appear to have been made known for the preservation of stone, unless we accept the metallic cement of M. TABARRY, which is not so much a preservative as a substitute for

\* *An Encyclopædia of Architecture.* By Joseph Gwilt. New Edition by Wyatt Papworth. Longmans, Green & Co.

stone which has decayed. The additions to the list of artificial stones are the Victoria Stone and the Leopold Foreign Rock Asphalte. Marble has of late come into more favour, but the only additional information upon the subject in one part of the new edition of the *Encyclopædia* is a paragraph about the various kinds derived from the Massa Carrara Quarries. In another place more is said about the use of marble.

There is nothing in this edition which will add to our knowledge of timber, although much information is available about Australian and New Zealand woods. The problem of the preservation of timber remains as before. Iron is more fortunate, as there is BARFF'S magnetic oxide, which acts efficiently. Some of the new varieties of bricks are mentioned in the section on bricks, but as the material is now so largely used the subject would bear a more lengthened treatment. In the last edition one paragraph was supposed to be adequate to convey information about terra-cotta. A few pages are now devoted to it, which may be taken as a test of its increase in importance.

The editor has this time recognised that drainage is essential for a house when it has to be occupied, and consults other oracles besides LEON ALBERTI. A very good abstract is given of the latest notions on the subject. The part on fireproof construction is also enlarged, and several of the new systems are described. It is remarkable to find in this part of the volume that Mr. WYATT PAPWORTH is not aware of the name of the architect of the new National Liberal Club, and gives the credit elsewhere.

It would be impracticable to add much to the pages on carpentry, but under the head of joinery there are opportunities to describe such aids as fixing blocks, solid wood flooring, wood tapestry, &c. Plumbry of late years has given rise to more inventions than the remaining branches of the building trades, and the editor gives the names of most of the new appliances, and suggests the qualities of many. Plastering has also its novelties, which are duly noted. A chapter has to be given to electric lighting, and those on ventilation and warming will enable the student to realise how far practical science has come to the aid of the builder.

The Specification has been elaborated, but it would have gained in clearness if the parts which are advisory were in a different type to clauses which can be reproduced. In the part on Estimating several of the old pages exemplifying PETER NICHOLSON'S scientific system of discovering the proportionate difficulty of work are wisely left out. Not much was gained by knowing that a foot run of bedded plates in roofing occupied '008 days.

The pages on "Beauty in Architecture" would have borne further revision. For instance, who can now discover what is meant by a passage like this:—"Within the short space of even a few months we have seen what is called the *Renaissance* style of architecture imported from France, drawing into its vortex all classes of persons, many of them among the higher ranks possessed of education to have patronised better taste." The passage must have been written in the days when fear of the French Revolution overshadowed good citizens. There is also a touch of snobbishness in talking of the necessity of "an intimate acquaintance with the habits of the upper classes of society," which suggests the standard of æsthetics admired by Mr. GWILT, but which will not serve in our time.

The whole of the pages about the Orders and details of Italian Classic remain as before. CRESY'S "Essay on Proportion," which was taken bodily from the "Encyclopædia of Engineering," continues to be the guide on one of the most delicate of subjects. The safety of theatres has caused the compilation of a few additional paragraphs.

The "List of Architects" in the edition of 1876 terminated with the name of TITE. Forty names have been added, comprising several which will always be remembered. But the scale of recognition is incomprehensible. Sir HORACE JONES, who was not a great architect, has as much space devoted to his works as serves for Sir GILBERT SCOTT. Not one building designed by the late EDWARD P'ANSON is mentioned.

The conditions of Mr. WYATT PAPWORTH'S task could hardly fail to hamper him, and will account for any shortcomings which are found in his work. He had to undertake a sort of restoration, and economy had to be considered in the adaptation to modern needs. Revision under the

circumstances becomes a sort of give-and-take problem, for the few extra pages in this new edition are insufficient to record the additions to the art and science of building. In describing new inventions the editor has sometimes to give no more than a sort of catalogue. But with all its drawbacks, the new edition contains an immense amount of information, both for students and for the everyday reference of practitioners.

#### THE MARQUIS OF BUTE ON SCOTTISH ARCHÆOLOGY.

THE opening address at the meeting of the British Archæological Association in Glasgow was delivered by the president, the Marquis of Bute, in the Merchants' Hall. In the course of his address the Marquis, alluding to the period of the union of the crowns and the transference of the seat of government, said it was an illustrative fact that they would only be brought in contact with some three or four buildings of that period, and only one of these of a State character. That one was the Chapel Royal of Stirling, built by James VI. for the baptism of his eldest son Henry, and even this was built before the union of the crowns, and its present condition, which they would see, was an interesting instance of the results of the subsequent changes. The other buildings, viz., the Argyll lodging at Stirling, now a hospital; Newark House at Port-Glasgow, now included in a timber yard; and Torwoodhead Castle, now a roofless ruin, were private dwellings, and as such were even in their best days the evidences not of public prosperity, but of individual opulence. If, however, this period had left almost no monuments in the shape of edifices, it had left plenty in the shape of destruction. Among these some of the most, perhaps the most, typical were the buildings of a public or State character. They were to visit four which had been royal residences, viz., Stirling, Rothesay, Linlithgow, and Dunfermline. They had in common that they were all more or less monuments of the brilliant epoch of the five first Jameses.

Rothesay was a third-century castle, with an addition of the time of James IV. The arms over the gate were among the earliest instances, if not indeed the first instance, of the employment of the two unicorns as the royal supporters. The present drawbridge was a most careful restoration from the existing piles found in the moat, and from parallel cases made for him by the late Mr. Burges. Rothesay Castle was burnt in Argyll's rebellion in 1685, and had been a ruin ever since. The three other palaces they would see had suffered during the later period. That of Dunfermline, a combined palace and abbey like the Escorial, he need hardly speak of, because its associations, both religious and historical, from the days of Malcolm and Margaret downwards, were so important and vast that he could not touch them in a single paragraph. The palace was last occupied by a king, by Charles II., at the beginning of August 1650. He left it on the 16th.

Another very striking instance of the results of the Union would be seen in the magnificent palace of Linlithgow, burnt by the English troops after their defeat at Falkirk on January 17, 1746, and which had remained unrestored. One more mark of the change was the present condition of the castellated palace of Stirling. They would see for themselves the state of the building—its abandoned gardens, its distimbered and neglected parks, its pleasaunce and tilting yard turned into a cemetery, a fate which was just impending for the historic hill-top which lay beneath its eastern wall. Their attention would be called to the great Dominican Church, Stirling, in which, among other events, Mary and James VI. were anointed and crowned. This church was now slowly undergoing a process of restoration, which had as yet extended only to the chancel. It was obvious that in the Middle Ages it was partially rebuilt, the chancel being the only part accomplished. With regard to the present restoration there were one or two things to be said. He trusted it would be neither accompanied nor followed by any modern outrage upon the usages of the past, such as the stone pulpit with which St. Giles, Edinburgh, had been disfigured, but that the wooden pulpit would be placed on the south side as the best position for hearing, as the Mediævalists would have done, and as was done in similar buildings in France and Belgium. There were three points upon which he hoped they would be very careful with this restoration. First, if the side chapels reached down into the nave, they ought to be incorporated with it. In the second place, if the vault of the nave was to be interfered with at all, he trusted it would only be interfered with with great caution. Thirdly, no one could doubt that there was a chancel screen. Its top was almost certainly occupied by a gallery as at Glasgow, where the town council seat was. Very likely it bore the royal throne. Its position was now occupied by a wall, as used to be the case in St. Giles, Edinburgh, where his lordship remembered the Queen's throne, and a curious wooden barbican resembling that of Rheims. He greatly feared that in the sweeping

restoration of St. Giles's, not only might the royal throne have been displaced from its ancient position, but the only remains of the Mediæval screen might have gone. He implored the authorities of Stirling to be careful how they tampered with the wall across their chancel.

It was stated that the eastern portion of the Dunfermline Abbey was cast down by the Reformers in 1560; but it was difficult to tell what that meant, as that portion did not fall till 1672, while the deliberate pulling down of the last part did not take place till 1819. On referring to the Parish Church, Rothesay, and the church of St. Blane, South Bute, as well as a prehistoric erection called the Devil Toes Cauldron, which was, perhaps, both a temple and a tomb, he spoke of Dunblane Cathedral, which had had the lead stripped off the roof for use in the siege of Stirling Castle, and which had not, as far as he was aware, been covered again. It was now to be completely restored, and as far as he was aware, the work was to be done in a carefully conservative manner. They would observe at Dunblane the very remarkable plan of the wall which separates the chancel from the nave. He imagined that it may have been masked by some immense wooden structure in the nature of a wooden loft. The remaining specimen of ecclesiastical ruin which they would see was Paisley Abbey, created in 1373 by Walter, the first High Steward of Scotland, as, he might say, an expression of the religious and cultured sentiment of the great house of Fitzillan, otherwise called Steward, to which he belonged, and the descendants of which had now occupied the throne for more than five centuries down to our present sovereign and patroness. In one respect the site, or part of the site, on which the abbey was built would present one of the most remarkable features in Scotland. The transepts, the lantern, and the chancel of the church must have been in ruin for some time, but the domestic buildings of the abbey still stood, though mostly unroofed, including the great cloister. These were, he believed, one of the only two specimens of domestic buildings of an abbey in Scotland. If anything was to be destroyed the churches could have better been dispensed with, as there were plenty of them; but even so late as a few years ago a great portion of the buildings at Paisley Abbey had gone in order to straighten the street by 18 inches or 2 feet. They had given place to a grimy plot of grass and an iron railing. While regretting the past they must, however, look to the future. The historical and, in one sense, the artistic treasure had been annihilated for ever; but the architectural and, in another sense, the artistic feature, could still be restored, and in any work of which Paisley Abbey might become the object, the first thing to do was to erect a new square of buildings, church offices, or anything else as they pleased, exactly upon the old foundations, harmonising with the church, and reproducing as far as possible the general idea of what had been lost.

#### INDIAN ARCHITECTURE.

THE following description is given by an occasional correspondent of the *Times*, in the course of a letter on a visitor's impressions of India:—

The magnificence of the architecture was a great surprise to me, though I knew well Fergusson's "Indian and Eastern Architecture," and had seen scores of Indian photographs, besides models of Indian buildings and the good casts at the South Kensington Museum. No scale appended to drawing or engraving—50 feet to the inch, 100 feet to the inch, 200 feet to the inch—really gives one an adequate impression of the size. No drawing or engraving really gives one a true sense of the material, the surface texture, the colour; yet the scale of the Mogul architecture and of the Dravidian and Chalukyan architectures is enormous; and the materials at the disposal of the builders, especially in Northern India, were firm and lovely in texture, brilliant in colour. The Mogul Palace at Delhi (mutilated now, but in parts intact) was more than 1,000 yards long, more than 500 yards wide. The Pathan Mosque at Kalburgah, with its whole area roofed in, covers more than 38,000 square feet. The regular type of a first-class Mogul tomb—such as that of Akbar at Secundra, near Agra, or of Jehangir at Shah Darrah, near Lahore—requires for its site a garden of many acres, walled in, umbrageous, many-fountained, perfectly kept up. It requires one or more magnificent semi-dome gateways, each with three or five portals, for its approach. The gateways will be similar in plan, and almost in size, to the southern gateway of the great mosque at Futtehpore Sikri, near Agra, which measures 130 feet by 85 feet in plan, and probably 150 feet in height. It requires a lofty terrace for its base, 300 feet long or longer, and 30 feet high. Above this it requires a second terrace, a third, and a fourth, each smaller but more ornate than the one beneath it, wherein to raise an enclosure of white marble trelliswork, pierced with lovely patterns. Inside this will probably be a cloister of the same material, but of greater delicacy in workmanship, enclosing the central tomb. The Taj Mehal at Agra, and the tomb of

Humayun at Old Delhi—where the King of Delhi, with thousands of retainers, retreated after the capture of New Delhi by our troops—are on the same scale, but the central edifice is different in each case.

For colour and surface texture the materials at the service of the architect in North India were splendid. The lower parts of the buildings are usually of red sandstone, so hard in texture that you might deem it red granite; and for the upper or central portion you have marble of exquisite whiteness or of opaline tints like the pearl. In the great tower at Old Delhi, the Kutub Minar, probably the finest tower in the world, where the Hindoo architect worked for the Moslem conqueror, you have sandstone, red, pink, and yellow, with grey quartzose rock and white marble. The combination of red sandstone with white marble is almost universal all through the best Indian buildings of the sixteenth and seventeenth centuries of our era, and was used in the Kutub Minar in the very beginning of the thirteenth century—more than one hundred years before Giotto began the Campanile at Florence. In the Upper Punjab red sandstone and white marble are less habitually used, but there brilliant effects of harmonious colour were obtained, as in the great mosque of Vitor Khan at Lahore, and in hundreds of nameless tombs now desecrated, by the use of Persian tiles. These tiles are most brilliant in colour, often true mosaic, each colour and each leaf let in separately on its own piece; and in the blistering sunlight of India they do not look garish.

There are whole groups of buildings built at one time, with co-ordination and immense variety, still existing though untenanted. Notable among them is the great group at Akbar's fantastic capital, Futtehpore Sikri, no sooner built than deserted, and the delightful group at Sirkej, near Ahmedabad. At Futtehpore Sikri water was not to be had, and so magnificent mosque and gateways, tombs of the saints and lovely pleasure-houses, dreams in stone and fantasies in marble, are left high and dry to the jackal and the wanderer. At Sirkej tombs of saint and king and queen and princes, mosque and exquisite pavilion, artificial lakes with palaces and stables, are barely occupied; but all show the one conception of the artist, the one hand of the founder. Where to find their equal in Europe for perfect execution of a harmonious but complicated plan, for co-ordination of many buildings to one effect, for simple paths and imaginative beauty, it would be hard to say.

For delicacy of carving and costliness of labour no buildings I ever saw approach the two white marble Jaina temples on Mount Abu, at the southern point of the Aravulli range. The older of the two is of the date of Edward the Confessor; simpler, nobler, more intellectual than its later and more lavish rival, the work "as elaborate as good taste would allow in any purely architectural object." (Fergusson, iii. p. 234.) Each of the temples is surrounded by a court with double colonnades. Each of the vaulted panels (about 100) in each colonnade differs from every other. In one you see ships, for the merchant prince, the founder, had sea-going fleets, and in other a goat-footed Pan (Gandharva) plays a reed-pipe. The temples stand on a mountain garden, 4,000 feet above the sea, an oasis on the verge of the great Indian desert. They are not much mutilated, though the Moslem held the land once, and mere barbarian Hindoos, in a native principality, have defaced with their coarse colours the white statues here and there. The Lamp of Sacrifice burns brightly in the fair twin temples, and the founders chose their site well—an Indian Sinai with a lovely plateau, environed with granite hills and forest greenery. So far I have spoken of structural architecture only; but India has several series of monolithic, rock-hewn temples of great magnificence. Some are decorated with admirable sculptures, as at Ellora, Nassick, and Karli, all within easy reach of Bombay. Some, as at Ajanta, near the battle-field of Assaye, glow with frescoes of good drawing and most harmonious colour. No other class of architecture is so durable, so unalterable, or so rich in results proportionate to the labour, for it is less labour to wheel the refuse material away than to bring material from far. But this class of work is only possible where you have rock of faultless character, smooth, firm, continuous, reliable. Doubtless there is something illogical in placing a temple under a hill, almost in a pit; though the rock may be hewn out far away from the side of the temple, and corridors are grooved out of the opposite rock to enable you to see the temple, its friezes, columns, pediments, pinnacles, roofs perfectly. Still, a monolithic temple—porticoes, columns, sanctuary, all of one unbroken piece—as large as a small French or English cathedral, fourteen or fifteen centuries old, is worth a long voyage to see. With buildings so superb in every part of India, ranging through more than twenty centuries, from the pillars of Asoka (B.C. 272 to 236) downwards, it is matter of deep regret that often they are still miserably protected. You will see at Agra and at Delhi and at Lahore that the cornelian and agate decorations, Florentine inlay really in origin as in style, have been picked out. You will see that they have been replaced quite freshly, and picked out again. Perhaps it is a Penelope's web the inlayers are playing at, in a spirit of self-

help; or perhaps Tommy Atkins in his more inquiring moments is the transgressor. You will see mosques mutilated by the so-called owners. Inquiring as to the defilement of a most lovely mosque and the gross neglect of the founder's tomb in a great city, you will learn that the highest British official is powerless in the matter; that he cannot even apply to the restoration of the tomb a donation sent him for that purpose; that the ownership rests with a guild of butchers; and that to turn a lovely mosque into a lazar-house is not repugnant to native feeling. You will find that in Buddhist and Jaina cave-temples, unearthed within the last dozen years, the faces of the saints and the exquisite forms of the women have been freshly mutilated by Mussulman iconoclasts. You will find that even the British Government is an offender, if it be an offence to brick up the face of the lovely Pearl Mosque in the fort at Lahore, in the last quarter of the nineteenth century, without any military necessity.

Mr. Henry Travis writes to the *Times* on the above:—After reading the very graphic account of architectural splendours in India—splendours mainly due to the variety of coloured materials used in their construction—it may surprise many of your subscribers to be told that there would be no difficulty in erecting buildings in the United Kingdom of equally beautiful stones. Quarries of them abound, and there are manufactories quite equal to any demand. Cornwall abounds in the richest porphyries and serpentines; Scotland in granites of various colours, and possesses a marble of a very pure white. Adopt a suitable style of architecture, and all these could be displayed here with as much effect as in India, and with no extra cost over and above that of the elaborately carved freestone buildings we are accustomed to see daily in the streets of the metropolis. The materials, indeed, are in daily use as ornamental details of buildings otherwise constructed of common stone. There is a very strong recommendation for their use apart from their beauty, viz., their absolute durability—a characteristic not possessed by freestone.

## WELLS AND THE CATHEDRAL.\*

BY PROFESSOR FREEMAN.

I AM sorry to say that though I am not quite the helpless creature which the newspapers have chosen to paint me, though I am not "laid up" or "confined to my house," still I am held not to be equal to any appearance at public meetings. I am, therefore, most unwillingly obliged to give up my purpose of doing a good deal at the present meeting of the Somerset Archaeological and Natural History Society. It was arranged that I should undertake, not for the first time in my life, the exposition of the two churches of Wells. This I cannot do; I the more regret it because of the new light which has lately been thrown on the history of the cathedral church at an important part of that history by its own sub-dean. Mr. Church's three papers on the episcopates of Reginald, Savaric, and Jocelin are specimens of the best kind of local work, and such as has never before been applied to this part of the story of the church of Wells. It is not everybody who knows how to treat a piece of local history, but the many years which the sub-dean has spent under the shadow of St. Andrew's has enabled him to do it as it should be done. I wish he had done it sooner; I might then have put some things differently in the little book which I wrote some years back from such lights as I had then. A work of that kind is not easy; the history of one of these ancient churches, the history either of its buildings or of its foundation, the mere succession of its members, is not a task to be trifled with; it cannot be dashed off by a swift-going pen at a moment's notice, like the "Etcetera" or "The Sign of the Ship" by the ready scribe of a popular magazine. It needs some control of the "forward, delusive faculty" of which Bishop Butler found something to say. It needs some practice in historic criticism, some notion of the nature of evidence, some restraint to be put on the popular belief that it is safe to say that a thing did happen, because it is not impossible that it may have happened. I do not know whether Mr. Church has written "charming papers," but he has at least written scholarly monographs. From those scholarly monographs I have learned something. I see that the dates of the buildings of the church of Wells—as I have understood them, as even Professor Willis understood them—must be thoroughly gone through again. I am not ready with a new theory; I can't make theories all of a moment. Before I give any opinion whatever, I must go through the whole evidence, and I must look it over again on the spot, which I am just now not quite in the case for doing. But I may throw out a hint or two which some one may, perhaps, look to during the meeting, which I may myself look to some other time. I speak only of things which may be, not of things which I at all say

were. All that I have ever done in the matter has been from printed sources; manuscripts are not my line. At once to dig the stones and to build the temple does not fall to the lot of every man; one may say that it falls to the lot of the Bishop of Chester only. Whatever I build I must have my stones dug for me, and, till Mr. Church took the quarry in hand, it seems that the stones had never been dug in right order. Metaphor apart, the printed sources to which I had to trust gave no true account of the manuscript records. When I wrote my little book, I asked that those records might be printed; Mr. Church's monographs supply a fresh reason for printing everything. From his report one thing is plain. In the architectural history of the church of Wells, we must not—as, on the strength of our printed authorities, we have hitherto been inclined to do—take a wide leap from Robert in the middle of the twelfth century, to Jocelin in the thirteenth. It is now plain that, beside them, Reginald, in the intermediate time, later in the twelfth century, also did great works of building. That is plain from several records of his time; but, unluckily, those records give us no hint as to the part of the church on which his labours were employed. That we must make out as we can from our notices of the other builders, and from the evidence of the building itself; and far be it from me to commit myself to any view as yet. But I may mark a few points for guidance.

First of all, as the sub-dean seems to have noticed, the conventional phrases about the church being well-nigh ruined at such and such a time are merely conventional phrases, and go for next to nothing. The old builders took a very small occasion for rebuilding or recasting if the fancy for rebuilding or recasting took them. Secondly, that we must remember that the old-English church of Primitive Romanesque, the church of Gisa and his predecessors, clearly lived on till the time of Robert—as the nave of St. John of Beverley lived on till the fourteenth century—and that part of it may have lived on longer still. When Robert is said to have built and consecrated a new church, that might very well, in the exaggerated language in which such things are set down, have really meant that he rebuilt the eastern part, according to the custom of his time, on a greater scale—as it was afterwards enlarged to a greater scale again. This work, be it noticed, would have made a fresh consecration needful. It is possible, therefore—I do not say that it is more than possible—that the present nave, by whomsoever built, immediately supplanted the Primitive nave. And it is tempting—I do not say it is more than tempting—to suggest Reginald as the man who did the supplanting. Only, to whomsoever we assign the nave, we must remember that it is evidently part of a design which took in the eastern limb and the transepts, and of which the nave would naturally be the last part built. Again, we must remember that there is one part of the building of quite different work from the nave, but which looks still more the time of Reginald. This is the north porch, clearly too late for Robert, clearly too early for Jocelin. Then again, it is perhaps not quite safe to assume that the west front is necessarily later than the nave. It is undoubtedly later in idea; but, as I said long ago, it need not, therefore, be later in age; there are marks in the building that look both ways, and when the late Mr. Parker and I examined it together, we came to the conclusion that the west front was the older, and we gave up that view only in deference to Professor Willis.

It was not at all unusual to add on a west front to an earlier nave, which earlier nave might in after times be rebuilt, or not. And it was especially usual in the age which, above all others, indulged in building west fronts which had no kind of relation to the nave, fronts which can be spoken of in plain words as "shams," though the word does seem to grate on some specially delicate ears. I can only say that, if anyone objects to call the west front of Wells a sham, it only shows that he can never really have looked at both sides of it; that is all. We have usually, when the Society meets in Wells, to raise our moan over such of the smaller antiquities of the city and its immediate neighbourhood as have perished since the time of the last meeting. We have had a longer interval than I had looked for since our last Wells meeting. We met here in 1863; we met here in 1873; I fully expected that we should have met here in 1883, but the time was put off till 1888. That is, the time of absence from Wells has been half as long again as the other time, a fact which cuts both ways. A full list of objects destroyed is likely to be longer; but it is harder to remember in 1888 than it would have been in 1883, whether a particular piece of destruction happened before or after 1873.

I am thinking chiefly of the smaller objects, specially the small domestic buildings, the good old houses which are such a special feature of the district, and of which everybody in town or country thinks himself clever if he can destroy one or two. I am pretty sure that the bishops' barn at Wookey vanished some years before the year 1873; but I am not clear when the dovecot began gradually to decay, before or after. Nor have I kept the exact dates of the various stages by which so much of the traces of the grand unfinished design of the Wells Market-place has given way to the increased

\* From a paper read in the absence of the author by Professor Boyd Dawkins, at the annual meeting of the Somerset Archaeological Society.

grandeur of a flaunting shop. How noble a feature in a street a series of Mediæval shops were nobody seems to think. But I am quite sure that it is since 1873 that an ancient house at Burcot, which I used greatly to delight in, and which I used as a model for some works of my own, was suddenly swept away, seemingly out of sheer wantonness.

Then farther from Wells is the admirable, the unique fish-house at Meare. Since our last meeting that has become a ruin. It is, I believe, strictly speaking, by nobody's fault that it has become so; but it has become so. And it surely should not stay as it was when I last saw it, last year. It was then not in the state of a ruin of ages standing, but in the same grievous state of havoc as the house which I saw in Herzegovina in 1875, which had been burned by the Turks. Now surely the Society might make some appeal to the owner. Most likely he knows nothing about it; these things are commonly left to some agent or underling of some kind, "to save or consume things as seemeth him best." Surely we could ask the owner of that unique house not to "restore" it, *quod absit!* the old house is ruined, and we don't want a sham one; but to take care of what is left and save it from utter decay. And, within the city, it was a great many years after 1873, it was some years after 1883, that one of the stateliest of the domestic buildings of the city was worse than swept away. Every one here must know that grand old house which stood not far from St. Cuthbert's Church, not enriched, but grand in its simplicity, with its three gables, its ranges of mullioned windows, showing in what kind of house a burgher of Wells once could dwell. It was a noble object to rest the eye on, as we passed from the lower church to the upper. Now, for what reason I know not, it has been cut down to the vulgarest and most paltry type of modern house; the gables have vanished, the mullioned windows have given way to rectangular holes of the poorest kind. What kind of being it can be to whom this kind of change gives any pleasure I know not, and I forbear to guess. Some here may have more certain means of knowledge. And these things happen daily.

People have begun to care for primæval and military antiquities; as for churches, they care for them rather too much; they are swept away by the subtler demon of restoration. But the small ancient houses of the land, really among the choicest of its antiquities, perish daily, and no man takes it to heart. Our great houses perish by mysterious fires: our small houses perish anyhow; one of the most characteristic classes among the relics of old times will soon be wholly lost to us. And there is another ancient building in the city about which strange and fearful rumours are going about. The bishops' barn at Wells is not quite equal to the abbots' barn at Glastonbury as an example of a class of buildings which few surpass in interest. But it ranks high in the class; it is one of the precious relics of the old days of the city and its bishopric. In no way is the skill of the Mediæval architects better shown than in their barns. To design a building for a lowlier purpose than that of a church or a palace-hall, to make it exactly suited for its own purpose and for none other, and yet to make it as truly a work of the highest art as any church or any hall—that was exactly what the Mediæval architects could do, but what I am quite sure that no modern architect could.

Set a modern architect to design a barn, and he would either stick it all over with incongruous ornament, or else give it no artistic shape whatever. But look at the old one; mark well its low and massive walls, its mighty roof with its soaring gables—a wonder of timberwork within—its solid buttresses, its narrow slits for windows—the narrow slit as much in place here as the broad window of many bays is in the church or the great hall—all solid and plain, but everything good and finished, the little enrichment that such a building allowed kept carefully for one or two fitting places—to have made such a building as this is indeed a triumph of the builder's skill. And yet I hear whispers of some designs against this precious piece of our local antiquities. I hear something said about applying it to some other use, about changing its essential features in order to suit the purposes of that other use. I read in a local paper that it was a pity that so beautiful a building should be put to so mean a use as that of a barn. Oh, the unwisdom of the ancient architect, who blindly deemed it his duty to put out his best skill for every work that he took in hand, into whose head it never came either to design a mean building for any purpose, or that any true and honest purpose could be mean, who, being called on to design a barn, designed a building that was perfect for its own use of a barn, and altogether unsuited for any other use.

It is the glory of Wells that it keeps so many buildings, from its great church and its great house downwards, which are still applied to the uses for which they were meant by their first builders; but one at least of its ancient barns still keeps its place, unaltered by any modern figures, on a list so honourable to church and city, and so nearly unique. One thing more. While we are dealing with rumours, what is this that is whispered touching something greater than the barn, touching the church of Wells itself? What is this that is whispered about a reredos? Some day or other there ought to be a fitting

reredos in the church of Wells; but we may very well do without it for the present. For any reredos made now is likely to be on peepshow principles, to show the "beautiful view" from the choir into the lady chapel. And a reredos made on peepshow principles would be a blow to the church which would perhaps never be got over. There is no greater misconception of the arrangements of a church than the notion of the "beautiful view" into the lady chapel. But I really don't wonder at it as things are. Everything in the choir is so "cabined, cribbed, confined," that one does not wonder at an escape being sought for anywhere. Only the escape is generally sought for at the wrong end. Once more, as I have said so often, as the great brass lectern teaches us, "in season, out of season," break down the middle wall of partition that is against us; let the church of Wells be as the churches of Lichfield, Hereford, Chichester, and Llandaff; then with the full length from west door to high altar forming one mighty whole, no one will be tempted to think about the pretty peepshow between choir and lady chapel. A lady chapel is built specially not to be peeped into; it is a thing of itself, a design of itself, designed to be kept quite apart from the great whole formed by the whole body of the church from the high altar westward. When the church of Wells is like the church of Lichfield, its clergy and choir in their place, its laity in their place, and the light screen between the two, then we will think of a new reredos—perhaps an old one—between presbytery and lady chapel, one the very opposite to a peepshow, one like the grand work at Winchester and St. Albans and Christ Church, Twynham. Till that can be, leave alone a thing which, if not good, is not conspicuously bad, certainly not worse than anything of the same kind is likely to be. Why Wells should linger behind the rest of the world I never could understand. Why what is found perfectly easy at Lichfield, perfectly easy at Hereford, should be thought strange and impossible here is altogether beyond me. At all events, if we cannot hasten the day of deliverance, at least let us not put it back. As yet the wide windows of the barn, the Italian alabaster of the reredos, are only in the stages of rumour. May they never come out of that stage. May they never find their way into any chronicle of actual facts, along with the destruction of the prebendal house in the North Liberty, along with the overthrow of the house of the *in-formator puerorum*, along with the breaking down of the wall between the Close and city, among the other merciless sweepings away of ancient relics and ancient memories which I can witness to during the eight-and-twenty years in which I have watched the doings of this city and its neighbourhood more narrowly than any other.

#### RESTORATION OF DUNBLANE CATHEDRAL.

THE cathedral at Dunblane, which is to be restored under the direction of Dr. Rowand Anderson, was visited on Saturday by the members of the British Archæological Association. The chancel is used as the parish church by the Rev. A. Ritchie.

Mr. Ritchie, in the course of his remarks, said that there was good authority for believing that at an early date a Culdee convent occupied the site of the cathedral. That convent was associated with the name of St. Blane, but the only fact that could be verified about him was that he was buried there. He appeared to have come from Ulster, and had been brought to Dunblane by an uncle, who had a little cell about Kilchattan Bay. It was supposed that the Culdee convent was erected into a bishopric by David I., about the middle of the twelfth century, but from that time till about a century later little was known about the building. About 1240 the building appeared to have fallen into an altogether dilapidated and ruinous state, and the revenues had become utterly exhausted. At that time Bishop Clement was appointed to the See, and it was to him that they owed the church, or at least the western portion of it. He found the place in ruins, and he left it a stately sanctuary. So far as they knew, from that time forward there were comparatively few bishops men of note. Of the more notable were Nicholas de Balmyle in the fourteenth century, who was also Chancellor of Scotland; and in the fifteenth century, Finlay Dermot, the builder of the first bridge over the Allan; William Stephen, the earliest Professor of Divinity at St. Andrews; Michal Ochiltree, who crowned James II. at Holyrood and built the church at Muthil. Passing on they came to James Chisholm, who did much in the way of finishing parts of the building, having put an extra storey on the tower, erected the parapets of the choir, and completed much of the carved woodwork. In the year 1588 the church had again fallen into a miserable and dilapidated state. Since that time the church had suffered many things. The pulpit had been unnecessarily removed from the middle of the west wall, and the tracery and the windows had been entirely renewed, with very bad effect and execrable taste, about the year 1820. Unfortunately, in

1860 the roof of the eastern part, which had never been uncovered, was erroneously thought to be in a bad state, and was sacrificed for the present erection.

The Rev. Professor Story, of Glasgow, said that one or two of the points which Mr. Ritchie emphasised were those that gave a special interest to the proposed restoration of the cathedral. The cathedral was one of the most interesting links between the earliest form of religion in Scotland and that at the present day, and it was in the light of that fact that the proposed restoration of the whole cathedral to something like what it might have been when first devised for religious purposes became so interesting. There were two ways of regarding great national monuments like this—the one of regarding them as mere old historical remnants, and the other of regarding them as links in our national history which ought to be preserved, or, if diverted from them, which ought to be restored to those uses for which they were originally designed. That, he understood, was the object of the proposed restoration, which he was certain they all felt in the hands of Dr. Anderson would be carried out with the greatest skill and with the utmost fidelity to the original intention of the builders. The building had suffered very much in past years from restorations, marked by good intention but by lamentable want of taste and of architectural skill. They had only to look at the eastern part of the church to see how much it had suffered. But fortunately it had not suffered beyond remedy, and the rest of the building was so far intact that it might be restored by Dr. Anderson to what was its original condition. In that national work he was sure they all wished him and those who were working with him the best speed, and he valued the opportunity of speaking for this, that he might express the hearty sympathy of this important and influential Association in the work which he had undertaken, a work devoted not to the interests of any one of the religious bodies into which Scotland was divided, but to the preservation of a great national monument, and which tended to impress upon our minds the great truth of the continuity of our history. The work of preserving such monuments with warm affection and care and handing them down to the future was one of the highest duties a civilised nation could undertake, and they should do well to take the opportunity of expressing their heartiest sympathy in the present project.

Dr. Rowand Anderson said the proposal to restore the cathedral had met with a great deal of opposition from various quarters. It had met with a good deal of opposition from those who thought that a building in a state of ruin should remain as a ruin, and that the great merit of a work of this kind was the fact that it was a ruin. It had also met with a good deal of opposition from a certain ecclesiastical quarter, those who thought they were the rightful successors to the possession of the building, and also from those who thought the Government ought not to make a gift to any ecclesiastical body. All those difficulties had been overcome, and in a manner, he believed, satisfactory to all parties, through the far-sightedness of the Secretary of State for Scotland, Lord Lothian, who took a warm interest in every matter of this kind. The building would be handed over to the Board of Manufacturers, a body that he dared say a great many of them knew nothing whatever about, and also a body whose name did not express their function. It came into existence at the time of the union of England and Scotland, and it was the oldest institution for the teaching of technical education in this country. It had long ceased to exercise that function, and had drifted into becoming a body having the care of works of art, and at the present moment it had the care of all the national works of art in Scotland. It was rightly judged that that body should hold the building. He was authorised to state that within the last few weeks Her Majesty had personally consented to the restoration and also to the transference of the building, which was Crown property, from the Board of Works to the Board of Manufacturers. He was also happy to state that the necessary funds had been contributed, first of all by the heritors, who had acted in the most generous spirit, and also through the munificence of a lady who had the interests of the Church of Scotland and the interests of art at her heart. The work would now be prosecuted with all possible energy, and he trusted that the result might be to show that in Scotland we were not indifferent to preserving those chapters in the history of our country which were so important to us, because they were all at one that neither a country nor an individual without a pedigree was very interesting. If ever this Association returned to Scotland he hoped they would see completed building.

Mr. W. G. Black said the revenues devoted to the keeping up of buildings of this kind in Scotland were drawn by the Woods and Forests Department, the disbursements were made by the Board of Works, and were subject very much to be curtailed or extended—seldom extended and nearly always curtailed—by the caprice of party government. Nothing, he thought, could be more disgraceful to a country than that the preservation of its monuments should be practically never cer-

tain for a single day. He urged that this divided authority should be put an end to. If the revenues were received by one body, and applied by one body, they would get clear of party interference, and the proper preservation of the most glorious relics and antiquities in Scotland would be at once secured.

A closer examination of the building was afterwards made under the guidance of Dr. Anderson. Standing in the nave, he remarked that, with the exception of two windows opposite each other at the east end of the nave, every part of the building was perfectly readable, and that there would be no difficulty whatever in dealing with it architecturally. He should only renew where it was structurally necessary to renew. For example, in the case of a moulding which happened to be decayed he was not going to cut it off, because the stability of the building did not depend upon the perfect nature of the moulding. It was only where there were structural defects that he should introduce any new work. Those were the lines upon which he would conduct the restoration. Outside, he drew attention to one of the windows he referred to. The window was divided into four compartments. They would see on the sill the remains of moulded bases; they would see also that there must have been moulded pillars rising up to the height of the capitals. There was no doubt there had been an arch over the window, and he was puzzled to know how that arch was finished. Inside the building, again, he drew attention to the double opening over the chancel arch, remarking that he had been unable to find an example of it anywhere else. Outside, again, at the west front, he drew attention to the extreme beauty of the elevation. It was not very large, but a great deal was compressed in its limits. All the features were intact, and there would be no difficulty in dealing with it. The doorway was very much worn, but he thought they should let it remain as it was. When they got the roof on decay would be arrested, and the building would be preserved for many generations to come.

#### PERMANENCY OF WATER-COLOURS.

SIR J. C. ROBINSON writes:—Among the communications I have received since the publication of my letter on the Government report on water-colours is one from a paper manufacturer, a gentleman who is, I believe, practically engaged in that industry on a large scale. It calls attention to a heretofore unconsidered danger to water-colour art, happily a perfectly remediable one, but which should be no longer overlooked.

The matter cannot be more clearly expressed than in the writer's own words. After stating that he is carefully reading the Government report, he says:—"What causes me surprise is that the mischief hidden in the material of the drawing-paper in use by artists should have escaped notice. You speak of the 'bleaching process induced by daylight,' but how greatly is this increased and intensified by the traces of the chlorine, almost universally employed in bleaching the rags in the process of making the paper, and which it is impossible by any amount of after-washing to eliminate. True, sulphide of soda is afterwards mixed with the pulp to neutralise the chlorine by converting it into a salt; but there is always danger of a sleepy or careless workman forgetting this; and who will be the wiser, or who will grieve until the delicate tints fade and the beauty perishes? Then the sulphide of soda, if not seriously injurious to the colours employed, cannot surely be without its effect on some of them. In page 27 of the report it is stated that 'a trace of this sulphate' was found in the paper, plainly indicating the presence of chlorine. Why not abjure altogether the use of chlorine, sulphide of soda, and every chemical in the manufacture of drawing-paper? True, the manufacture would be more difficult and expensive, but even with the slightly increased price that the artist would pay he could afford a penny for posterity."

The following postscript at the end of the letter ought, perhaps, to be noticed:—"The Government report states that in each square foot of the paper used there was found 'one grain of sizing matter,' but this is absurd; drawing-paper contains 10 per cent. of size."

It is satisfactory to add that my correspondent in conclusion announces that he has turned his attention to the manufacture and supply of non-chemical drawing-papers. It is highly probable that, as my correspondent suggests, the paper has been an active agent in many cases of unusually rapid and complete fading of drawings. I shall revert to this further on. In the meantime, may I be allowed to touch upon some other points with which the foregoing matter will be found to be more or less connected?

Readers of the *Times* will, perhaps, recollect the controversial storm which may be said to have raged two years ago, *à propos* of the use of one particular pigment—indigo. That this beautiful colour is in its nature fleeting and unstable the South Kensington experiments have now conclusively shown; are we then to give up the use of this colour as hopelessly un-

reliable? The same very serious question must of course be asked in regard to many other all but indispensable pigments. It is of no further use blinking these questions; rather should they be boldly faced and every instalment of suggestive information welcomed by the leaders of water-colour art practice, in the confident trust that the end will be important discoveries, which, so far from crippling and restricting the resources of the art, will, on the contrary, infinitely ameliorate and extend them.

Now, some of the most complete and striking instances of the fading of water-colour drawings are those in which indigo has played a principal part. Our early landscapists, the Varleys, Barrett, De Wint, and Copley Fielding made copious use of this pigment in skies, foregrounds, and middle-distances—in a word, in every detail of their works; and when it has faded, as it has in many instances almost completely off the paper, it has reduced these once brilliant and harmonious drawings to utter chaos. In very frequent cases in which indigo and Indian red have been mixed together to produce dark grey and purple tints, by the total disappearance of the blue colour, while the red has remained intact, the tint, once cold murky grey, has changed to a fiery salmon-coloured red. In these extreme cases it is most likely that the inherently fugitive qualities of the indigo have been greatly assisted by the bleaching chemicals remaining in the paper; for although indigo, under every ordinary condition under which it has been recently tested, has been shown to be more or less fugacious, to my knowledge it does not invariably behave in this unreliable manner. There is an instance in point before my eyes as I write, and it raises the all-important question, whether the fugacious tendency in pigments can be neutralised or entirely overcome by counteracting chemical processes, to be made use of in the preparation or after-employment of such colours.

My walls here are in part hung with ancient tapestries, and I have one specimen in particular, a fine piece of old arras, made about the year 1500. I obtained it in Spain, and it has been carefully mended, a few patches inserted, and a new margin or border, a couple of inches wide, added at the old Royal Tapestry Manufactory in Madrid. This border, I should state, is of deep indigo colour, carefully graduated to match the old blues in the tapestry, which are obviously from indigo. Now all the colours employed in this, and indeed in all the other tapestries I possess, have more or less faded, some having almost totally vanished, with one notable exception, and that is the indigo; that colour, on the other hand, has in every instance stood its ground. It is introduced in the piece I have specially referred to in extensive passages of background and masses of drapery, and, allowing for superficial discolouration, I believe that after nearly 400 years this colour shows scarcely any perceptible signs of fading. The inference is that the old Flemish dyers were acquainted with some very efficacious mordant, or other means, which rendered the extremely fleeting pigment stable and permanent. Why, then, should not this be done now? And if in the dyer's vat, why not on the artist's palette? That this permanence is not now habitually secured is curiously illustrated in the very piece of tapestry I allude to, for the patches and the new indigo border added in Madrid about twenty years ago have, on the other hand, very perceptibly faded since the hanging has been in place on my walls, and they are now visibly out of harmony with the ancient enduring tint which they once carefully matched.

Blind rule of thumb has hitherto been the only guide in water-colour art; rule of science should now be made to succeed it; I think I need not apologise for offering further instalments in that direction. Water-colourists, if they will only bestir themselves, need have no fears for the future prospects of their art. There are, I believe, no reasons why the existing difficulties and drawbacks should not be entirely overcome; and if this were so, it is my conviction that there is no medium, no method of painting so admirable, or which lends itself with such pliability, diversity, and extent of range to every form and requirement of pictorial embodiment as the modern English water-colour process.

#### VENTILATION OF GUILDHALL, YORK.

IN consequence of the success attendant upon the application of Messrs. Robert Boyle & Son's system of ventilation to the Council Chamber at the Guildhall, London, and other public buildings of a similar kind, it has been applied to the Council Chamber at the Guildhall, York, an ancient structure of considerable historical interest, the ventilation of which was very defective, though a number of air inlets and open extraction shafts were provided, but which, as is usually the case with such rough and ready contrivances, had generally to be kept closed owing to the down-draught proceeding from them, rendering the ventilation practically nil, and semi-suffocation the natural consequence.

These defects have been entirely obviated since the application of Messrs. Boyle's system, consisting, in this instance, of two of the latest improved patent self-acting air-pump ven-

tilators, 30 inches diameter, fixed upon the roof, and connected by means of 15-inch diameter pipes with two hoppers placed over perforated panels in the ceiling. This effectively provides for the extraction of the vitiated air, which is continuously drawn off, there being not the slightest down-draught, whilst an ample supply of fresh air is admitted through seven of Messrs. Boyle's improved air inlet tubes, 5 feet 9 inches by 10 inches by 4½ inches, fixed against the wall in different parts of the chamber.

A valuable feature in this system is that it is perfectly under control, a matter of no small importance in the ventilation of a public building, and that it has proved successful in this as in other instances where dependence was previously placed upon imperfect inlets and simple open pipes or flues—which, as a means of extraction, wherever tried, invariably prove a failure—is evidenced by the following extract from a report received by Messrs. Boyle, with permission to use, from Mr. E. G. Mawbey, the city surveyor of York, after a lengthened experience of the system:—

"I have pleasure in informing you that the ventilation of this Council Chamber, which I have carried out on your system, is very satisfactory, notwithstanding that the room is altogether too small for the number of persons occupying it during Council meetings."

This system, which has made the name of Boyle in connection with ventilation a household word the world over, may be said to be not only one of the most efficient in existence, but also the most economical, the latest improved form of the air-pump ventilator being now supplied, we believe, at about fifty per cent. less than previous and inferior forms, besides being of a much more substantial make, it being the special aim of Messrs. Boyle to supply the most reliable ventilating appliances at the lowest price consistent with furnishing the best workmanship and material, and we think that the remarkable success which has attended their efforts in this direction fully justifies the wisdom of the course adopted.

#### SOMERSET ARCHÆOLOGICAL SOCIETY.

THIS Society held its fortieth annual gathering last week at Wells.

The inaugural address was given by the president, the Bishop of Bath and Wells, and in the course of it he said that when he was for two or three weeks in Normandy, last June, he was impressed with the wonderful beauty and grandeur of the Norman churches. He saw the same features in the castles of Falaise, St. Aignan, and Mont St. Michel, and they appear also in our own Norman cathedrals, minsters, and castles on the Welsh border. When there his attention was turned to the Norman conquest of England by being in the birthplace and in the burialplace of William the Conqueror (Falaise and Caen), and being surrounded by the familiar names of places such as Bayeux, Coutances and Avranches, which occurred so often in the history of the Conquest, it was impossible not to feel the close connection between the character of the builders and the prowess of the warriors. And that feeling was brought to its height when in the cathedral city of the martial Bishop Odo, with its magnificent Norman church, one had spread before one's wondering eyes the Bayeux tapestry, which he was almost ashamed to say interested him more than all the cathedrals put together. Prowess in architecture and prowess in war went hand in hand; the buildings which it was the province of archaeology to study and explain, were a clue to the character of the people who built them, and this was borne out by the history of the Egyptians, Assyrians, Greeks, Romans and Moors. It was an unaccountable fact that the art of drawing, which in the time of William the Conqueror had acquired the wonderful vigour displayed in the Bayeux tapestry, should have stood still and been in disuse and made no progress for nearly 500 years. That it existed they had abundant evidence in the beautifully illuminated missals and other MSS. of early times, in early painted glass in churches, in fresco drawings, such as the St. Christopher in Wedmore Church, and many others elsewhere, and in occasional portraits. There was at Westminster a very early portrait of Richard II., and this meeting ought to be reminded of the most interesting portrait discovered a year or two ago by their secretary, the Rev. James Bennett, in South Cadbury Church, and described in last year's report. The church was dedicated to St. Thomas, and so about contemporary with Bishop Reginald. Mr. Bennett while poking about his church noticed that the wall in the south-east end of the nave sounded hollow. He accordingly pulled it down, and in doing so discovered behind it the very deep splay of a small Norman or Transition window. On the side of this splay was a portrait in vivid colours of a bishop, with strongly marked features, and mitre on head. Surely it was the portrait of St. Thomas of Canterbury. He hoped that that mention of it would cause an archaeological pilgrimage to Cadbury, and that some new Chaucer would immortalise it.

## WESLEY MEMORIAL CHAPEL, EPWORTH.

THE large village of Epworth, in the Isle of Axholme, celebrated as the birthplace of the WESLEYS, is about to have a new Wesleyan chapel and schools, as a memorial of JOHN WESLEY, whose father was rector of the parish. The old chapel is very badly situated in a back street, and no longer suitable. The new chapel will be erected in the main street, on a large and open site. The design, as illustrated, shows a chapel to seat 400, a school for 200, with three classrooms, and also two other rooms, ladies'-room, kitchen, &c. These occupy two sides of a quadrangle, and on the third side it is intended to erect a minister's house. In the centre a statue of WESLEY is proposed. The buildings are faced with Shipley stone and Ancaster dressings. The roofs are of slate. All the roofs and joiner's work are pitch pine, and the heating will be by hot water. The memorial-stones are to be laid on September 20, and it is expected the buildings will be completed in June next. The architect is Mr. CHARLES BELL, F.R.I.B.A., of 3 Salters' Hall Court, Cannon Street, London, and the builder Mr. H. KELSEY, of Epworth, whose tender was 2,740*l*.

DESIGN FOR HARRINSON MEMORIAL CROSS, ST. MARY'S  
CHURCHYARD, READING.

THIS design was submitted in a limited competition for a memorial cross to the late Dr. ISAAC HARRINSON, the author being Mr. GEO. W. WEBB, A.R.I.B.A., 14 Friar Street, Reading.

THE BRITISH ARCHÆOLOGICAL  
ASSOCIATION.

THE members attending the Congress of this Association on Tuesday in last week visited Bothwell Castle and Church, Craignethan Castle, and the Stonebyres Fall of the Clyde, and in the evening the Marquis of Bute, the president, delivered his inaugural address in the Merchants' Hall. At Bothwell House the party was received by Mr. W. J. Easton, of Glasgow, agent to the Earl of Home. In visiting the ruins of the castle and the excavations, Mr. Easton said that last spring an old plan of the castle, indicating a tower beyond the walls, was recovered. The Earl thereupon resolved to make excavations with a view of tracing the foundations, and these had revealed a round tower, a small square one, a main gateway with two flanking towers, and the causeway leading to it.

*Bothwell Castle.*

Mr. J. Dalrymple Duncan, one of the hon. local secretaries, stated that neither the exact date of the erection nor the name of the founder of Bothwell Castle had been ascertained, but that it unquestionably dated its origin from the thirteenth century, and that the various points of similarity between it and the Château de Coucy suggested the likelihood that its architect was assisted by a knowledge of the plan and details of that great fortress. It was not even improbable that he was himself a Frenchman, brought over in consequence of the connection which about the middle of the thirteenth century must have existed between Scotland and France. The castle, in all likelihood, was built by the Olifards, who during the greater portion of the thirteenth century were lords of the Barony of Bothwell. He then traced the history of the castle and its possessors, and coming to the third Lord Douglas, who succeeded to the castle and lordship of Bothwell, said he was known to have frequently resided there, and was believed to have been the restorer of the edifice, which had doubtless fallen into very great disrepair during the contests for its custody. Probably the great hall, the chapel, and other buildings were constructed by him, for they bore the Douglas

arms in several places, and it was about the period of his possession of the barony that the Scots nobles first ceased to shut themselves up altogether in the donjons of their castles, and began to erect within the enceinte buildings with some pretensions to comfort. In 1454 Bothwell was forfeited to the Crown, but again passed back to the Douglas family, and continued in their hands till about 1655, when it was given off as a patrimonial provision to Archibald, Earl of Angus, eldest son of William, first Marquis of Douglas. He built the present modern mansion, using the old castle as a quarry from which to extract a large portion of the material required for its construction. He was succeeded by his son Archibald, second earl, on whose death, unmarried, in November 1715, of wounds received at Sheriffmuir, Bothwell devolved on the Duke of Douglas. The last-named nobleman possessed it till his death in July 1761, when there followed the well-known "Douglas cause," which was ultimately decided in favour of Archibald Stewart, who was in 1790 created a peer under the title of Baron Douglas of Douglas Castle. Bothwell now belonged to his descendant, Charles, twelfth Earl of Home. It was without question the finest example of the feudal castles of Scotland, and like its prototype Coucy, consisted of a great donjon dominating an enceinte, surrounded by high walls with towers at the corners. The donjon was 65 feet in diameter, and 90 feet in height to the top of the parapet, while the total length of the building was 325 feet by 120 feet in width. The north and east curtains had evidently been rebuilt about the end of the fourteenth or beginning of the fifteenth century.

Mr. Loftus Brock said Bothwell was one of the most ancient and interesting of the many castles of Scotland, and one that required a little study in detail in order that the gradations which Scottish baronial architecture passed through from early to modern times might be comprehended. Taking in the new excavations, the castle formed originally an irregular parallelogram, with circular towers projecting at the angles, and with a square tower here and there. These towers were remarkable from their having projected beyond the line of the curtain wall, thereby giving a good many surfaces for attack, such as they did not find in later works. Where, it was asked, did this system of defence originate? It was known that the Norman castles were designed upon a totally different plan. The Edwardian castles in Wales were something like this, and yet we could scarcely imagine that they were so early in date—in their general number at any rate. They had, he thought, the explanation in this, that the military architecture of France was very similar to what they saw at Bothwell, and that the English and the Scotch alike followed the development of French military architecture. Those of them who were at Pembroke Castle in Wales would see at once the remarkable resemblance there was between the great donjon tower of Pembroke Castle and the great tower of Bothwell Castle. The tower at Pembroke Castle was erected in the time of Edward I. The tower of Bothwell Castle, they might fairly conclude, was of earlier date, and it was quite within the bounds of possibility that it was the work of the Olifards, who owned the property at the very commencement of the thirteenth century. The building was remarkable for the careful masonry, for the close joints, and the great precision with which the stones were fitted, indicating beyond doubt that the Scotch masons of that period were extremely good workmen. From the stones which had been found in the excavations it would be noticed that each mason had marked his stone with his own particular mark. The ravages of war were but too apparent on the walls before them. An examination of the huge tower showed that in one or other of the sieges to which the castle was subjected it must have been undermined, and that the outer half of it must have fallen. At a subsequent date the then owner of the castle, whom he took to be Douglas the Grim, made the tower secure by building a wall across the fallen part, thereby converting what had been a circular apartment into a half-circular one. In the banqueting-hall was a window which many of them would take to be a geometrical window of 1260, but which in reality was very late fourteenth-century or early fifteenth-century work. There was one in St. Murren's Chapel, Paisley, of date 1420, very similar in form. Bothwell Castle being one of the oldest castles in Scotland, it was to be taken into consideration with that still older one which they would see at Rothesay. There were many points of resemblance between Bothwell and Rothesay, the chief difference between them being that at Rothesay the centre space was circular, while at Bothwell it was square or in the form of a parallelogram.

*Bothwell Church.*

At Bothwell Church Mr. Loftus Brock observed that the building was one of the collegiate churches which were founded so frequently in Scotland about the middle of the fifteenth century or somewhat earlier. The monastic foundations in Scotland passed through the same gradations as they did in England, and later the practice of founding colleges with secular priests became as universal in Scotland as in England. There was scarcely an instance of the founding of

any of the later monastic establishments, either in one country or the other, after the middle of the thirteenth century. The founder of Bothwell Church was a Douglas. In the corner of the east end near the roof they noticed the Moray stars, and on the other the Douglas heart. He took the date of the building to be the fourteenth century or early in the fifteenth. The pointed stone roof occurred again and again in Scottish castles, but here there was an unusual external covering. The outside was roofed with slabs of stone curiously overlapping one another, and which had kept out the elements all these hundreds of years since the foundation of the church. The tracery of the windows had disappeared on the south side, as also had the tracery of what had been the beautiful eastern window. It was possible this church was never completed. There were but too many instances in Scotland of a chancel having been erected, and the work carried no further. There seemed to be structural evidences that in this case the intention had been to throw out transepts left and right. At the west end they could see traces of large arches which the masons had filled in before leaving. In Bothwell Church they had as good an example of the so-called French influence as was to be found in any building he knew, due, he thought, not so much to any influence from France or abroad as to a peculiar development of the Scotch late style.

After lunching at the hotel the party took train for Tillietudlem, and thence walked to Craignethan Castle.

#### *Craignethan Castle.*

Mr. Dalrymple Duncan read a short paper upon the history of the castle. The original name, he said, of the lands of Craignethan was Draffan, and they were first heard of in 1160. They were held by Sir Hugh Crawford and Alice, his spouse, but no documents had been discovered throwing any light on their ownership for a considerable period after that date, though it was probable they formed part of the vast possessions of the house of Douglas. It was also uncertain at what period they passed into the hands of the Hamiltons, but in all likelihood James, first Lord Hamilton, obtained possession of them. Shortly after the forfeiture of the Black Douglases in 1455, he probably erected the keep of the castle, which appeared to date from the latter half of the fifteenth century. In 1529 the fortalice, under the name of *Castra de Nauthan*, with the adjacent lands, was disposed by James, second Lord Hamilton and first Earl of Arran, upon his natural son, Sir James Hamilton of Finnart, and to this remarkable man it undoubtedly owed alike much of its architectural importance and historical interest. To him were attributed the enclosing walls and towers round the keep, with the outer court-yard. In 1540 King James visited him at Craignethan, but in the following year he was accused of connivance in a plot to assassinate the king, and though it seemed not improbable that the charge was groundless, he was executed, and his estates forfeited. In 1541 the Lord Treasurer's accounts contained entries in connection with the castle, and in that year it seemed James again visited it while on a hunting expedition in Lanarkshire. The lands remained annexed to the Crown till after the king's death, when the forfeiture was recalled and they were restored to the son of Hamilton of Finnart, who subsequently became Sir James Hamilton of Evandale, and who conveyed them to James, second Earl of Arran. There was a tradition that Queen Mary was at Craignethan after her flight from Loch Leven. The palace of Hamilton at that time being merely a square tower quite unsuited for a royal residence, Craignethan Castle may have been selected for that purpose. It was undoubted that, after Langside, Moray took possession of both these places. In 1579 John and Claud Hamilton were attainted for their supposed complicity in the assassination of the Regent Moray, and had to fly. Craignethan was besieged, and in it was found James, third Earl of Arran, who had been insane for many years; but he was taken prisoner, and kept for some time in captivity. Craignethan remained in the hands of the Hamiltons till 1661, when the Duchess Anne sold it to Andrew Hay, who seems to have been a cadet of the house of Tweeddale. The house within the enclosing wall, which was built by Hay, was offered as a residence to Sir Walter Scott by the first Lord Douglas, and Lockhart told us that he was at first disposed to entertain the proposal favourably, though circumstances occurred which altered his intention. It was well known that Craignethan was the prototype of the Tillietudlem of "Old Mortality." In 1720 the estate was acquired by purchase from the Hay family by a Duke of Douglas, and in the hands of his representative, the twelfth Earl of Home, it still remained.

After inspecting the ruins, the members went down the glen to Craignethanfoot, and drove thence up the valley of the Clyde to Lanark. The five o'clock train was caught, and the party returned to Glasgow shortly after six.

An abstract of the President's address, delivered in the evening, appears on another page.

On Wednesday a visit was paid to Torwoodhead Castle and Tapock broch, a description of which will be found elsewhere.

Afterwards Stirling was visited, and the Greyfriars Church there, the Castle, and other buildings of interest inspected.

#### *Stirling.*

Mr. William B. Cook read a paper on the features of the town. He referred first to the derivation of the name, discarding the popular idea that the word was derived from the Celtic "striveling," meaning strife—whether warfare or the strife of waters—and favouring the idea that the name simply meant "the rock in the marsh." He suggested that the present spelling of the name was probably due to the assumed connection between it and the word "sterling," referring to coin as true or genuine. He described the building of the castle at various periods, pointing out that as it stood now the principal buildings were due to the Stuart kings, and gave a sketch of the history of the castle under four divisions, viz., as a royal residence, as a place of arms, as a seat of national assemblies, and as the scene of other events of historical interest. The Greyfriars Church, he said, was the scene of the coronation of Mary Queen of Scots, and also of James VI. He pointed out Mar's Work as a remarkable building, erected by the Earl of Mar in 1570, with stones taken from Cambuskenneth Abbey. Argyll's Lodge, believed to be one of the finest specimens of the old Scottish mansion-houses in existence, was built by William Alexander, first Earl of Stirling, Secretary of State to Charles II.

At the evening meeting a paper on the history of the ancient See of Glasgow was read by Archbishop Eyre.

#### *See of Glasgow.*

The Archbishop said the first mention found of the site of the old cathedral was in connection with the history of St. Ninian. About twenty years before the Romans finally left Britain, and a few years before Ninian, in the year 397, built his church at Whithorn, he appeared to have built a cell on the banks of the Molendinar. Jocelin, the monk of Furness, stated that when Kentigern came to Strathclyde he made his settlement "near a certain cemetery, which had long been blessed by St. Ninian, and was surrounded by dense and overshadowing trees." The founder of the See of Glasgow was this St. Kentigern, known also as St. Mungo. Kentigern took up his abode on the banks of the beautiful rivulet, then called Molindonor. Beneath the shade of the venerable trees a little oratory and a very humble wooden cell arose about the middle of the sixth century; and from here St. Kentigern spread Christianity throughout the whole extent of what formed later the British kingdom of Cumbria, *i.e.* the territory from Loch Lomond and Stirling on the north to Windermere and Appleby. Glasgow became the ecclesiastical capital of this extensive region. Here St. Kentigern was buried after the labours of half a century, A.D. 603. No record remained of the immediate successor of Kentigern, and there was but little information on the history of the See previous to its restoration by David I. About the year 720 the Britons of Strathclyde appeared to have obtained from Ireland a bishop named Sedulius. The convulsions of the tenth century saw the See in abeyance, and its possessions were seized by laymen. The restoration of the See of Glasgow in the early years of the twelfth century was the work of the son of St. Margaret. When the bishopric was restored by David John Adiaurs, who had been tutor and afterwards chancellor of the province, he was elected bishop and consecrated in 1115. His first care was to provide a church to be his cathedral. The ancient cemetery and its girle of trees seemed to have been nearly all that remained at Glasgow of St. Kentigern when Bishop John laid the foundation of his church. It was begun before the year 1124, and consecrated in the year 1136. Bishop John held the See for the space of thirty-two years, and was succeeded by Herbert, who held the See for seventeen years. To the episcopate of Bishop Herbert they must assign the foundation of what became the great abbey of the diocese. Walter, High Steward of Scotland, founded in 1163 at Paisley a monastery for Cluniac monks. The fourth occupant of the revived See was Jocelin, who was called to the chair of St. Kentigern from the great Cistercian monastery of Melrose. This energetic prelate obtained in 1175, as soon as he was appointed to the See, from William the Lion, the grant of a burgh, which was confirmed by Pope Lucius in 1181; and King Alexander, by a charter in 1189, granted to the bishop the right of a fair. This right was a valuable privilege from the fact of its attracting trade to the burgh. Jocelin began at once to make preparations for a new cathedral, as the structure of Bishop John had been destroyed by fire some forty years after its consecration. Jocelin died in 1199 in his monastery of Melrose. William of Malvoisin, a learned Frenchman, succeeded to the See in 1200. After the space of two years, he was translated to St. Andrews. Walter was the successor of Malvoisin, and was Bishop of Glasgow for twenty-four years. Walter was succeeded in 1233 by William de Bondington, Chancellor of the Kingdom. To him must be assigned the commencement of the present cathedral, and he completed the crypt and the choir before the year 1258. After Bondington John Cheyam suc-

ceeded to the See, which he held from 1260 to his death in 1268. Robert Wishart or Wiseheart was next appointed. He was Bishop of Glasgow for forty-four years, and died in 1316. John Lindsay was appointed to the See in 1322. His episcopate was a time of troubles, in consequence of war with England. He died on April 9, 1335, and the next possessor of the See was William Rae, who built in 1345 a bridge over the Clyde, where now the Stockwell Bridge spans the river. After Bishop Rae, Walter Wardlaw succeeded. He was created a Cardinal in 1384, and died in 1387. A canon of the cathedral—Matthew of Glendoning or Glendinning—was chosen to replace the Cardinal Bishop. During his episcopate (1389-1408) the wooden spire, for which timber was procured from Luss, was struck by lightning, and totally destroyed. With the intention of erecting a stone steeple on the tower of the cathedral, Bishop Glendoning collected some material, but was prevented from carrying out his wish by his death on May 10, 1408. William Lauder succeeded Bishop Matthew. He began the work of the stone spire. His arms and a griffin salient are cut in stone on the lower part of the steeple. After an episcopate of seventeen years, he died on June 14, 1425. John Cameron was next appointed to the See of St. Kentigern. He continued, and probably completed, the spire. Also he might be credited with the building of the chapter-house on the level of the crypt, and the vestry above it. The successor to Bishop Cameron was William Turnbull, who was translated from Dunkeld to Glasgow in 1447, and consecrated in 1448. During his episcopate he founded a university in his episcopal city. Seven months before the foundation of the university, a charter of James II., of April 20, 1450, granted in favour of Bishop Turnbull, raised the city from the rank of a burgh of barony to that of a burgh of regality. This regal barony, held of the Crown for the simple *reddendo* of a red rose, was from this date passed free from all feudal service. After an episcopate of seven years, Bishop Turnbull died in 1454, and was succeeded by Andrew Muirhead. John Laing succeeded in 1473. He was succeeded by Robert Blackader. By a bull, dated January 9, 1492, Glasgow was raised to an archbishopric, with Dunkeld, Dunblane, Galloway, and Argyll for its suffragans. James Beaton was the next Archbishop, and he was translated to St. Andrews on the death of Archbishop Forman in 1521. Gavin Dunbar, Prior of Whithorn and former tutor to James V., was next appointed to the See of Glasgow, and must be looked upon as the originator of the College of Justice, inasmuch as James instituted it by his advice, the first president being the Abbot of Cambuskenneth. Another work of Archbishop Dunbar's was the building of the gatehouse at the Bishop's Castle. Archbishop Dunbar died on April 30, 1547. The last possessor of the See of St. Kentigern was James Beaton, the second of the name. Few dioceses in Christendom had had a more glorious or edifying existence of fully one thousand years than Glasgow's ancient See. It began with Kentigern and ended with Archbishop Beaton II., who in 1560 retired to France and died at the age of eighty-six on April 25, 1603. The names of Kentigern, Jocelin, Bondington, Wishart, Cameron, Turnbull, Blackader, Dunbar, and James Beaton would always be household words in the west of Scotland. By the lovers of art and of archæology the memory must always be held in special veneration of the men who built the cathedral, a noble work of architecture, with its magnificent crypt unsurpassed and unrivalled. A little longer than Elgin, it was the second in size of all Scottish cathedrals.

#### *The Great Seals of Scotland.*

Mr. Allan Wyon, F.R.G.S., chief engraver of Her Majesty's seals, read a paper on "The Great Seals of Scotland." He said the earliest known great seal for any king of Scotland was made for Duncan II., who commenced his reign A.D. 1094. The earliest known seal in England was that of King Offa, who began to reign in 757. In both countries the seals at first had only one side, and were affixed to charters in "placard." The seals with two sides and attached pendant to documents were first made in Scotland for Alexander I. in 1107, and in England for Edward the Confessor in 1042. The seals of Scotland, although usually similar in general design to those of England, namely, with the king enthroned on one side and the king mounted on horseback on the reverse, had far greater varieties in design and size than those in use in the southern kingdom. Having pointed out the differences of the legends on the seals of England and Scotland, he described in detail the designs of the Scottish seals. He said that the seal of James I. was used for a longer period than that of any other seal in the series. It was the *Clavis Regni* for nearly ninety years, it having been first used shortly after the release of the sovereign from captivity and his return to Scotland in 1424, and continued in use until the accession of James V. in 1513, thus very nearly rivalling in this respect the use of the famous Brétigny seal which was in use in England for 111 years—from 1360 to 1471. Each of the three Jameses after the first put marks of difference upon the seal, and it had been by the observation of the use of these that the coinage of Scotland at this period had been settled.

James V.'s seal was engraved after the same design as his immediate predecessor's, but was a very poor imitation of it. With the first seal of Queen Mary began a new order of seals. The Gothic style was replaced by the Renaissance, and whilst the sovereign was represented enthroned on one side, the counter seal bore no second representation of the sovereign, but was merely an heraldic device.

#### *The Wall of Antoninus.*

Rev. Dr. J. Collingwood Bruce read a paper on "The Wall of Antoninus." Antoninus's Wall differed from that of Hadrian in being a rampart of earth, not of stone. Like Hadrian's, however, it had a deep fosse on its north side and a military way on its south. It also was provided with stationary camps for the residence of its defenders, and some minor structures, resembling the mile castles and turrets of the southern wall. It strongly resembled in its general character the great German wall which extends from the Danube to the Rhine, which was entirely an earthen fortification. Unhappily for the purposes of the antiquary, Graham's Dyke, or the Wall of Antoninus, lay in the district which was traversed by the lines of communication uniting the eastern with the western sea, and the two great metropolitan cities of Scotland—Edinburgh and Glasgow. The progress of improvement had done much to obliterate the lines of Lollius Urbicus. For fourteen centuries this *via militaris* served the necessities of the district. The same was the case on the Northumbrian wall. But rapid changes had taken place since, and it was now but the wreck of its former self. In the vicinity of Falkirk, both to the east and the west of it, the works were colossal. The ditch in Gordon's day, near Castlecary, was 50 feet in breadth and 23½ in depth. The rampart or wall, which was 22 feet distant from the fosse, was 24 feet broad and 5 feet in perpendicular height. Over most of the other places the wall had entirely disappeared, the fosse alone marking its course.

(To be continued.)

#### ANCIENT SCOTTISH ARCHITECTURE.

AT the evening meeting of the members of the British Archæological Society on Monday, Mr. Thomas Blashill presided. Among others, Mr. Ewan Christian and Professor T. Hayter Lewis were present.

Mr. E. P. Loftus Brock read a paper on "The Peculiarities of Ancient Scottish Architecture." Scottish architecture, he said, so far as was included within historical times, might be divided into three broad divisions, namely, the works of the ancient Christian days, of those in Romanesque and Pointed styles, and of those erected since the introduction of Renaissance or Italian taste. Of the first it might be briefly said that the works were similar to the contemporary ones of Ireland, from which, without doubt, their style was introduced. The ornamentation was similar to what was now found upon so large a number of crosses and slabs in Wales, Cornwall, and in many other parts of England, all in like manner derived from the art of the native church in early times. There were many small churches and oratories still remaining, and still many more which, although of later date, resembled them in many particulars. These, like the other fabrics of the early church in our isles, were square-ended and fairly well orientated, there being, however, this peculiarity which was not noticed, or not to so great a degree, in English works. It was that there were many early churches which were many degrees out of the line of orientation east and west. There were also many of which the angles, and not the fronts, were nearly free from cardinal points, in this respect resembling the great church of St. Sophia at Constantinople. Thus, among others, the following might be noted at random:—St. Giles, Edinburgh; Uddingston, Ratho, Corstorphine, Goolan, Seaton, Dunglass, Linlithgow, Dalmeny, Kirkliston, Douglas, and many others not only in the home counties but in the isles. Of all the churches of which plans were given in Muir's "Notes" only four were due east and west, or nearly so. Of all those named in the "Ancient Parochial Churches" only a single example was due east. These features of the earliest of Scottish works were of no little interest to the ecclesiologist student, for they appeared so opposite to the arrangements of the churches of Italy, where no rule of orientation had been observed at any time, either early or late, and where the churches faced in any and every direction.

As the churches of Scotland were founded, so did they continue. The past was found in the present to our own day in this respect. Thus Glasgow Cathedral, rebuilt over and over again without one stone remaining of the earlier churches, yet showed a square east end, and also in the axis of the present lengthy structure a great divergence from true orientation. It doubtless derived this from the earliest fabric erected on the site, the angles of which, and not the faces, were more truly in the direction of the cardinal points, if they might account

for the present axis by analogy from the instances of the earliest structures remaining in the country. The Mediæval works of Scotland claimed their longest attention. They were of the highest order of merit as regarded artistic design and feeling. The Romanesque style was found in perfection later than in England, but the examples which remained were richer architecturally. They had some sculpture, but the effect was produced by architectural features more entirely than across the Border. Dalmeny and Leuchars were examples. While the plan was but an enlargement of such churches as Kilpeck, what Shrobdon was, Barfreton, and many others, yet in all these the sculptured ornamentation was more apparent than in Scotland. It was in churches of this age that apses were found, but they disappeared only to occur again, as they also did in England for a short time, and in a few instances angular in form, and not semicircular, towards the end of the fifteenth century. The church of Linlithgow afforded a very good example.

The first Pointed style was found with many combinations of Romanesque features, and the stage of transition continued for a much longer period than in English or French work. The style had produced some of the most beautiful works that Scotland possessed. Arbroath and Kilwinning Abbeys, St. Andrews and Elgin Cathedrals, and Holyrood Chapel, afforded perfect specimens of purity of design and beauty of execution that had never been surpassed in any other country even in structures of larger size. These works had been said sometimes to resemble English, sometimes to resemble French churches. They did neither. They were designed in a more compact manner than in England; they were taller in proportion to their widths, the parts are smaller, they were united more to the adjoining ones, and had been studied more in relation to the parts that came next to them. While it was true that the plain flat soffits of the porches of Laon Cathedral were found also at Arbroath, yet, speaking generally, while there were certain resemblances, there were many features in French work that never appeared in Scotland, and many Scottish features not to be found in France.

One of the most remarkable features of Scottish architecture, and one in which it greatly differed from either English or French, was that there were but two Pointed styles, and not three. What was known as the Perpendicular style in England did not appear in Scotland. In its place there was a continuance of second Pointed forms, with certain variations in the design of the window tracery, at first not a little perplexing to the student. The beginning of the style had all the features of our own geometrical work, and the same stiffness in the design. Of this Glasgow Cathedral, in its choir and also in the name, afforded the largest and one of the best examples, and they could trace the progress of the design to the first incipient example of open tracery—three lancets contained within a single window, a design not only graceful, but very common. The church of St. Monance, erected about 1369, had, with far more solidity of form so far as regarded the structure, all the features of our own flowing Decorated style as regarded the patterns of the windows. The apse of Linlithgow, some few of the windows of Dunblane chancel, and the east window of Melrose had certain upright lines in the tracery not unlike our Perpendicular style, and so far, but no more, there might be a certain resemblance. Yet the College Chapel of Aberdeen, erected about 1494, had flowing decorated tracery, enclosed within a semicircular arch. Dunblane itself had flowing decorated windows beside, and of the same date as that which he had cited, and at Melrose the same thing might be observed to a far greater degree. Iona was of peculiarly early form, but its ornamentation was late. Corstorphine Church, founded in 1429, was also very early in appearance, but very late and curious in all its features. It was stone-roofed, showing an elaboration but a continuance of the form of roofing of the earliest oratories. Crichton Church was another early-looking church, with a low tower, having the peculiar Scottish feature of a parapet walk around it, and a saddle-backed roof. Its windows had flowing tracery, but it was only founded in 1449. The design of the window tracery was infinite in its forms, and all of very great beauty—in some examples similar to English patterns, in some few to French ones. He did not agree with statements made to the effect that these windows were Flamboyant in design, pure and simple. There was nothing but what any school of artists could work out for themselves, and a single man of genius would have individuality enough to introduce the use of such a feature as that to any style. Scotch work was full of such signs of personal design, and Roslin Chapel might be cited as the design of one mind following upon contemporary work. It was neither foreign nor English. Its lacework patterns here and there might find a counterpart in some Belgian work. Its heavy-pointed band vault might find a better one in many a Scottish castle, but the prentice pillar and the general conception was nothing if it was not an individual design. The same might be said of the adaptation of the beautiful and peculiar crown on the steeple of St. Giles's, Edinburgh.

After comparing further the Scottish work with the French, Mr. Brock said a few characteristics of Scottish architecture might now be regarded on account of their difference from English work. Of these, one of the most remarkable was the fact that no very ancient castles remained. There were no buildings counterparts of their own Norman castles. While the keep, not unlike that of a Norman castle, was to be found constantly, it was of much later date. It was more than probable that some of the walls of these keeps were of very early date, but the appearance was deceptive, since some such buildings even of the seventeenth century were constructed with all the massive appearance of Norman works. The earliest castles were of earth and stockading. One of the oldest works, the Castle of Rothesay, had a very ancient circular enclosing wall, having for its counterpart those of the earlier brochs, but all the architectural features were of no earlier date than the twelfth century. Another feature which claimed their notice was the absence of ancient parish churches, such as they saw in the landscape throughout the length of England. Where an ancient church remained it was mostly a large building or a portion of a large one. Small ancient oratories remained only on desolate islands or in districts far away from centres of population. Another feature was that so frequently a building of no very large size was found never to have been completed, and another was to find that a large building had been rebuilt in early times, all but its lower portions. Of this Paisley Abbey was an example. The explanation was, alas! only too readily given in the wars which desolated the fair face of the country for so extended a period. Another feature was that Scotland to-day found the great bulk of her ancient buildings in ruins, and that these ruins had become lessened to a very serious extent during the last 200 years. He had done his best to show that the ancient buildings of Scotland were the work of Scotchmen, and that they were different from any others. Their surpassing beauty and interest, their mute witness to the past events of the country as open leaves of its history, were to be seen and recognised by all.

But these ruins needed support, they needed care, they needed attention, or they would be lost to the nation. Scotland had done much in recent years, but she must bestir herself in this respect to do the work systematically, or her sons and her daughters in years to come would have lost part of what could never be replaced. A great mass of Elgin Cathedral fell but about a short hundred years ago. The capital witnessed also the fall of Holyrood, and the work had never been replaced.

Dr. Rowand Anderson said he was proud to find that Mr. Brock combated the belief that the Scottish people were almost entirely indebted to France for their architecture. That was not so. But he was not altogether inclined to go the length of Mr. Brock, and to say that this architecture was solely and exclusively the production of the Scotch. He thought that up to the War of Independence, after the death of King Alexander, the ecclesiastical architecture of Scotland and the castellated architecture in England ran in parallel lines. There were many distinctive features to be found there that were not found in England. On the other hand, he did not think that the features here were so different from what were found in England as they found between various districts in England. But undoubtedly after the War of Independence, when communication with the South was practically cut off, the Scotch developed a style of architecture which was strongly marked, and was only to be found in Scotland.

Mr. Ewan Christian remarked that the influence of the French might be distinctly seen in the architecture of Stirling Castle and church. He was very much interested in what he saw at Paisley the other day, as he did not know they had anything so fine close at hand. In some of the Paisley works there were a vigour and power which were delightful. It was to be hoped that researches would be continued in Scottish archæology.

Professor Hayter Lewis said he was much surprised on going to Stirling to find the neglected state of that most interesting castle. The old chapel was now a store-room, and there was not a particle of the old castle used as it ought to be. One could hardly speak too strongly of the absolute necessity of making representations to the Government, and he hoped they would be able to devise a memorial on the subject.

#### SCOTTISH BROCHS.

AN excursion to Stirling was made on Wednesday in last week by the members of the British Archæological Association, and in the course of the day Torwoodhead Castle and Tapock broch were visited. Mr. J. Dalrymple Duncan read a paper on the occasion. Mr. J. Dalrymple Duncan, when the party had gathered within the walls of the tower, referring to the structure remarked that among the various relics of the past which time had spared to them the Scottish brochs possessed a

special interest, both because they were a type of building absolutely peculiar to our country, and from the fact that they showed that the prehistoric architects who constructed them had possessed alike forethought and resource in working out the idea of an edifice so admirably suited to fulfil the objects for which it was intended. A broch might shortly be defined as a hollow, circular tower of dry built masonry from 40 to 70 feet in total diameter, having within the thickness of its walls a series of chambers and galleries, lighted by windows, all looking into the central area. The only aperture to the outside was a doorway through a tunnel-like, square-headed passage, with slightly-inclined sides 5 to 6 feet high and about 3 feet wide, constructed in the wall. The wall, which was from 9 to 20 feet thick, was solid for about 10 feet from the ground, except where it was pierced by the entrance, or partially hollowed out by the construction of oblong chambers with rudely-vaulted roofs. Above this the wall was carried up with a clear space of about 3 feet wide between the exterior and interior portions. Into this hollow horizontal ranges of slabs were inserted at intervals of 5 or 6 feet, thus forming galleries about 6 feet high and 3 feet wide, which ran completely round the tower. These galleries were connected by a stair which ran up to the top of the tower, and were lighted by windows in the inner wall of peculiar construction, placed vertically over each other. The central area was from 20 to 45 feet in diameter. It was difficult to say with certainty what must have been the original heights of the brochs, as the upper portions of all the specimens known had been demolished.

The best preserved was the broch of Mousa, in Shetland, which, though incomplete at the top, was 45 feet in height, so that they must have occasionally, at any rate, attained an altitude of 50 feet. The object of the builders of the brochs was undoubtedly to provide a place of temporary shelter and defence to which they could retire with their cattle and other valuables during the raids and forays of foreign marauders, which at the time of their construction were constantly occurring in the north and west of Scotland. The brochs were unmistakably Celtic in their character, and, as he had said, were peculiar to Scotland. They did not bear any proper relationship to any variety of fortified edifices known in historic times. They had been compared to the round towers, but while in outward appearance there was a certain amount of similarity, and both buildings seemed to have been intended for the same purpose, there were marked and signal points of difference. It seemed certain that there was no reason for ascribing a lower condition of civilisation to the occupants of these edifices than to the builders of the bee-hive huts and dry-built churches of early Christian times. The brochs were mostly found in the district of country lying to the north of the Caledonian Valley, and the isles around the northern and western coasts. South of the Caledonian Valley only three of those curious relics of the past were known to exist:—(1) The broch on the northern declivity of Cockburn Law, in Berwickshire; (2) one at Coldoch, on the borders of Stirlingshire; and (3) the broch of Tapock, the highest point of the Torwood, in which they then stood.

The last-named edifice was first excavated in August 1864 by Colonel Joseph Dundas, of Carronhall, who read an account of his discovery to the Society of Antiquarians of Scotland on March 18, 1865. Its appearance previous to its excavation was that of a conical hill or mound, flat on the top. On the west side of the mound there was a precipitous crag of about 100 feet in depth running north and south for about 800 yards, and on the north, east, and south sides the slope was gradual. At about 70 feet from the centre of the mound there were the remains of a wall carried round the mound until it reached the precipice on each side. Beyond this there were the remains of a second wall. Both of these walls, on the earth being removed, were found to be built of large stones roughly put together without cement. On the other side there were traces of a third wall extending along the face of the cliff, and filling up those places where the rock was not so abrupt as at the other parts. These outworks were not an isolated characteristic of the Torwood broch, as four of the Caithness and Orkney brochs were similarly protected. At the time of Colonel Dundas's excavations the mound was covered with heather and brackens, and overgrown by a clump of large fir trees. Operations were first commenced on the south side, and resulted in the discovery of the staircase, the doorway of which was completely blocked up with rubble. Work was then begun on the top of the mound, when, after the removal of an immense mass of large stones, rubble, and earth, which was thrown over on the east side to the amount of upwards of 200 tons, the structure was found to be a circular wall of 15 feet thick, enclosing an area 35 feet in diameter. At the height of 6 feet from the floor the upper part of the wall was put back 18 inches, thus forming a sort of shelf. The entrance doorway had two of the massive lintels still upon it. It was about 7 feet high and 3 feet wide at the door- cheeks, behind which were the usual bar holes. The whole length of the passage was 18 feet 6 inches. To the left of the doorway was the staircase, as usual in the thickness of the wall. There were eleven steps, and the length of the passage leading into them was about 12 feet. The height of wall re-

maining was not sufficient to show any trace of the galleries, but the presence of the stair implied their former existence. There were no chambers in the thickness of the wall on the ground floor, but all the other features of the building were of the typical broch.

#### THE LATE MR. JOHN BROWN, C.E.

THE *Birmingham Post* announces the death of Mr. John Brown, M.I.C.E., in his 65th year. Mr. Brown was one of the best-known members of the mining industry in Staffordshire, and was held in high esteem by a large number of professional and personal friends. He was originally, we believe, mining engineer at the Cannock Chase Collieries, and on retiring from that position he acquired a prominent position as confidential agent and consultant in mining operations in the district, and also had an extensive practice, extending over the Midland and northern districts, in mining arbitrations. The position which Mr. Brown held in his profession is evident from the fact that some years ago he was president of the North Staffordshire Institute of Mining Engineers, and in 1885 he was president of the South Staffordshire and East Worcestershire Institute of Mining Engineers. He was also the first Professor of Mining at Mason College, Birmingham. This appointment he held only for a short period, his professional engagements, necessitating frequent absence from Birmingham, compelling him to resign it. He was succeeded in the chair by Mr. Benton, the present professor.

#### Theatre Exits and Fire Risks.

SIR,—I have read the various letters on the above subject which have recently appeared in your columns, and I feel strongly that something more than the mere adoption of the several materials suggested is essential to secure the safety of the theatre audiences in event of a fire scare. A fire-resisting screen or curtain, constructed of "silicate cotton," is in itself an admirable thing, and the device of saturating wood, textile fabrics, &c., with "pyrodene" or "cyanite," or any of the other non-inflammable solutions, is very good in its way, but the point which has to be most seriously taken into consideration is the prevention of panic. The majority of theatre-goers presumably are ignorant of "silicate cotton" and its fire-resisting properties, neither do they know much as to how inflammable bodies might be rendered non-inflammable, and the public mind must therefore be educated by keeping the matter constantly before it.

My suggestion is this. The enterprising and far-seeing theatre-managers in Liverpool, who have lately fitted up curtains under Mr. Max Clarke's patent, should in some way make known to their nightly audiences that when the curtain is down, should there be any fire or even smoke on the stage, there is no possibility of it penetrating through to the auditorium. The curtain itself should bear on its face, in large letters, some information as to the nature of its construction, and the programmes might contain an explanatory footnote.

Sir, it is notorious that the main cause of loss of life in a theatre, when once the cry of "fire" is raised, is panic. A theatre which, otherwise, might easily be emptied in a very few minutes, has its doors and passages choked up by terrified crowds, and I contend that this would be obviated if theatre-goers were taught to know that, no matter how fiercely a fire might be raging on the stage its influence could be completely shut off from the auditorium by simply lowering the fireproof screen or curtain. To impress this fact upon the public mind, I hold it to be essential that the fireproof screen or curtain should be lowered after every act, so that the audience might acquire perfect faith not only in the efficiency of the curtain itself, but in the perfect ease with which it can be made use of, as a fireproof division, upon a sudden emergency.—Yours faithfully,

ROBERT MACPHERSON.

Gowan Lea, Willesden Green, N.W.: Sept. 5, 1888.

#### An Architectural Hint from India.

SIR,—Within the last few days a highly-cultivated traveller has been describing to us, in the leading English journal, his surprise and delight on seeing for the first time the architectural splendours of India. Although he had turned over Fergusson's pages, he remarks that no scale appended to the engravings gives an adequate impression of their immense size, still less of the charm created by the variety of coloured materials used in their construction. It would not be of much practical use to refer to this interesting communication, if it were not well within the margin of possibility to do the like, or much

the same, in this country—magnitude alone excepted. You have more than once allowed me to urge the freer use of the beautiful and durable igneous rocks in the construction of our urban buildings, and it is some satisfaction to be able now to point to a complete granite edifice in the City; but although this building is satisfactory as a first attempt, it is entirely wanting in one of the elements that should, I think, distinguish every granite structure—an element that creates no additional expense, and yet adds immensely to its beauty and artistic effect, viz. variety of colour.

Let me, then, make a few brief extracts from the letter referred to, of coloured materials used in Indian buildings, supplementing them with a list of British stones that would produce the same splendid effect, with the additional advantage which we have been struggling for nearly half a century to secure for our changeable and trying climate—an absolutely durable architecture. This done, we should probably find to our surprise that we had actually created a national architecture. There is no question of expense, because, if they are appropriately treated, these hard and everlasting materials cost no more than elaborately-carved and moulded and ever-decaying freestone.

But let us join our traveller in India, and listen to what he has to say:—"The magnificence of the architecture was a great surprise to me. . . . For colour and surface texture the materials at the service of the architect in North India were splendid. The lower parts of the buildings are usually of red sandstone, so hard in texture that you might deem it red granite; and for the upper or central portion you have marble of exquisite whiteness, or of opaline tints, like the pearl. In the great tower at Old Delhi . . . you have sandstone—red, pink, and yellow—with grey quartzose rock and white marble. The combination of red . . . with white . . . is almost universal . . . and was used at the very beginning of the thirteenth century—more than 100 years before Giotto began the Campanile at Florence. In the Upper Punjab . . . brilliant effects of harmonious colour were obtained . . . by the use of Persian tiles . . . most brilliant in colour, often true mosaic, each colour and each leaf let in separately on its own piece. . . . They do not look garish. . . . At Futtehpoore Sikri . . . at Sirkej, tombs of saint, king, queen, and princes, mosques, pavilions, and palaces are barely occupied; but all show the one conception of the artist, the one hand of the founder. Where to find their equal in Europe . . . it would be hard to say."

Now, how do we stand in this country for the production of such architecture as this? Well, there are red, grey, and white granites, yellow and white quartzose rocks, black basalt, and porphyries in the United Kingdom in abundance. The quarries are numerous; the supply equal to any demand. The hardness of the materials is of no account, as machinery surfaces and burnishes them with astonishing speed. Extra cost upon elaborate and perishable freestone may be avoided. All that is necessary is a simple and appropriate style of architecture, in which large and small splays take the place of elaborate mouldings, and geometrical mosaic of two or more colours the place of carving and sculpture.

It may be said, I think, that in a building where colour is to be the characteristic, the less moulding the better. Where colour is introduced in architectural design, it should predominate. The more the intention of the designer to depend upon colour for effect is made obvious, the more satisfactory the result will be. Such, at least, seems to be the lesson taught by these Indian buildings.—Yours truly,

H. TRAVIS.

#### GENERAL.

**The Queen** has consented to lend *The Roll Call*, by Lady Butler, for exhibition for a short time in the Fine Art Gallery, Leeds.

**A Statue** of Burns, being a replica of the one by Sir John Steell on the Thames Embankment, and costing 25,000 dollars, was unveiled at New York on Friday.

**A Proposal** has been made within the past week to present the Bishop of Durham with a portrait of himself, along with a pastoral staff.

**The Vicar of Trevor**, in making excavations at Valle Crucis, a Cistercian abbey in the Vale of Llangollen, is said to have discovered the tomb of the founder, a grandson of Owen Gwynedd, Prince of Wales. Five large stones have been laid bare, including two floriated crosses, an engraved spear, sword, and Grecian ornament.

**The Italian Exhibition** in London has many attractions. Foremost we may mention the reception-hall, which contains some noble examples of Italian sculpture, and on the right a collection of pictures lent by the King of Italy and from the Italian National Gallery, amongst which the *Charge of Bersaglieri* is most notable. The pavilion of the Roman jewellers is full of unusually effective objects, and commands and arrests attention from the many thousands of visitors.

**Mr. W. H. Smith, M.P.**, has agreed to open in October the great South Gare breakwater at the mouth of the Tees, which virtually completes the improvements which the Commissioners have been constructing at Tees mouth during the last twenty-five years.

**Mr. W. Howard Seth-Smith**, of London, has been appointed architect of the new Town Hall, Lydney, Gloucestershire.

**The Old Church** on Brentor, Tavistock, is to be shortly restored by the Duke of Bedford, who owns the Tor.

**Plans** have been prepared for considerable extensions and improvements of the general railway-station at Shrewsbury.

**A Bulgarian National Theatre** has been opened in Sofia, and the Municipal Council have voted a subsidy of 10,000 francs for the manager.

**The Spire** of the cathedral in the city of Christchurch, New Zealand, a building designed by the late Sir G. G. Scott, has been partially destroyed by an earthquake on Saturday last.

**A Site** for a new church to be built at Horwich has been given by Mrs. Wright, of Mottram Hall, Wilmslow.

**The Tunnel** through the Khojak mountain for the Candahar railway is progressing fast. It will be five miles long.

**A Sanitary Inspection** of Ayr has just been made by the town authorities, the result of the examination having proved generally satisfactory.

**The Plans** of Mr. Malcolm Stark, jun., of Glasgow, for the building of a Board school for 600 children, were on Monday approved of by the Kirkintilloch Dean of Guild Court. The estimated cost is 4,705*l*.

**The Hospital** on Crellin's Hill, built from the designs of Messrs. Bleakley & Cubbon, of Birkenhead, was opened on Tuesday by the Lieutenant-Governor of the island.

**The Anglican Cathedral**, Melbourne, is approaching completion. Owing to the value which it is expected can be realised by sale of the site, it is proposed to pull the structure down and rebuild it in a locality where more attendance is likely to be obtained.

**A Handsome Block** has been erected for the offices of the *Aberdeen Free Press*, from the designs of Messrs. Ellis & Wilson. The first issue of the paper from the new offices was made on Monday.

**A Committee** has been appointed to carry out the extension of Ardrossan new parish church, the cost of which it is thought will not exceed 600*l*.

**A New Science and Art School** is proposed to be erected at Coatbridge, N.B., under the auspices of the Old Monkland School Board, and a sketch plan, with estimate of cost, is to be obtained. The building, it is thought, can be erected for 3,000*l*.

**St. Olave's Church, York**, has been reopened after repairs, which have been carried out under the direction of Messrs. Demaine & Brierley, architects.

**A Public Meeting**, which was well attended, has been held in Dover in favour of a scheme for erecting a new promenade pier and pavilion music-hall in the bay, at a cost of about 25,000*l*.

**The Preston Town Council** have decided to call in an engineer to report on the borough surveyor's scheme for disposing of the sewage of the town.

**Mrs. C. Turner** has purchased a site in Everton on which she intends to erect a church to the memory of the late Mr. Charles Groves.

**The Vicar** of St. Paul's, Preston, proposes to build another church to provide accommodation for the rapidly-increasing population of the district.

**The Duke of Sutherland** has offered a central site to the town of Longton for the erection of the proposed municipal buildings, in addition to the land he has given for a public park and the site for a cottage hospital.

**The Theatre Royal, Shrewsbury**, has been redecorated from the designs of Mr. Randal, architect, of that town.

**A Donation** of 3,000*l*. towards the completion of the new church of St. Hilda, the West Cliff, Whitby, according to the original design, has been made by the family of the late Rev. John Turner, formerly curate of Whitby.

**The Directors** of the Buxton Gardens Company have approved of the plans of Mr. W. R. Bryden, architect, Buxton, for the erection of a building connected with the existing pavilion for theatrical entertainments. The estimate is 3,000*l*., and building operations will be commenced next month.

**Upexe Church, Devon**, has been reopened after restoration under the direction of Mr. R. Medley Fulford. The building dates from about the year 1329, and, like a similar building in the adjoining parish of Thorverton, known as "No Man's Chapel," has been for several generations occupied as a dwelling for cottagers.

CRIMINAL PROCEEDINGS, under the new Merchandise Act, will be instituted against any person falsely representing any form of ventilator to be a Self-acting Air-pump Ventilator, said title being registered and our Trade-Mark, applicable only to ventilators manufactured by us. Any infringement renders the person infringing liable to two years' imprisonment. ROBERT BOYLE & SON, LD.

A Business Supplement

# The Contract Reporter.

to The Architect.

LONDON, SEPTEMBER 7, 1888.

J. Lowes & Son, Durham	175	0	0
T. COATES, Durham (accepted)	119	0	0

# IMPROVED FLAT BRICK FIRE-PROOF FLOORS.

No. 1.—Longitudinal Section.

No. 2.—Longitudinal Section.

## NO THRUST ON WALLS.

The BEST as well as the CHEAPEST Fire-proof Floors yet introduced.

THEY are constructed with purpose-made hard-burnt bricks, with specially moulded dovetail projections, forming a mechanical key to hold the plaster protecting the iron, and provided with wedge joints throughout, forming the most compact and solid floor known.

Experiments show a resistance to load and impact greater than furnished by the ordinary concrete floors. No thrust is transmitted to the walls, as in all arched construction, the walls being tied in and strengthened.

The floors are practically noiseless, the different densities of the concrete, brick and plaster, with the air space above, intercepting the sound vibrations.

The depth of the finished floor is 6 to 9 inches only, and when the saving on this head is taken into account, the cost does not exceed that of the ordinary combustible timber floor of corresponding strength.

**TRADE NOTES.**

SOME time since a large clock was erected in Adderbury Church, Oxfordshire, by Messrs. John Smith & Sons, Midland Clock Works, Derby, and now the same firm have fixed a large carillon in connection with the clock, which plays seven tunes on eight bells (one tune for each day of the week) at three, six, nine, and twelve o'clock. The largest bell is 25 cwt.

MR. E. H. SHORLAND, of Manchester and London, has recently supplied his inlet ventilators to the Isle of Wight Infirmary, Ryde.

A HANDSOME two-light stained-glass window has just been erected in the parish church of Hanging Heaton, near Dewsbury. The principal subject which runs through both lights represents Mary at the feet of Christ. In addition to this the left-hand light has two groups, "The Descent from the Cross" and "The Last Supper," and the right-hand, "Mary at the Sepulchre" and "The Agony in the Garden." The work has been efficiently executed by Messrs. Jones & Willis, of Birmingham and London.

THE Anglo-Danish Exhibition gold medal for grates has been awarded to Mr. J. B. Petter, of Yeovil, for his Nautilus grate and mail-clad stove.

THE annual trip of the Halifax Builders' Association (president, Mr. Richard Oates) took place on the 29th ult., to Liverpool. The Manchester Ship Canal was visited and the works inspected.

THE improvements designed by Messrs. Bradshaw & Gass, architects, Bolton, for the Bridgeman Street Baths and Assembly Rooms in that town, are now approaching completion, and the premises as newly-adapted to the purposes of first-class baths and assembly rooms will shortly be in use.

THE Streets and Buildings Committee of the Edinburgh Town Council estimate their total expenditure for the ensuing year at 41,625 $\frac{1}{2}$ l., and the total receipts on account of ex-

penditure at 5,500 $\frac{1}{2}$ l. The expenditure on account of drains and sewers is estimated at 11,505 $\frac{1}{2}$ l., and the receipts on account of expenditure at 570 $\frac{1}{2}$ l.

A LARGE number of labourers are at present employed on the new harbour works at Calais, with the object of getting the harbour so far completed that it may be used during the Paris Exhibition. April next is the date proposed for the opening of the harbour. All the docks are well constructed, and the two principal ones are of enormous size. A series of small docks, in the form of a canal, with dams and bridges, run from east to west, forming a half-circle round the town very close to the site of the old fortifications.

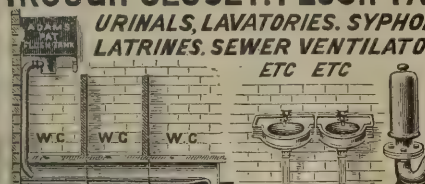

THE streets of Barnet were lighted by electricity on Saturday night. There are seventy-one lamps, each placed on a strong iron post 12 feet in height, and fitted with a reflector. The electricity is conducted over the town by about 5 miles of hard-drawn copper wire. When the wires cross main thoroughfares they are laid underground in creosoted wooden troughs, and are insulated with rubber and encased in lead tubes to protect them from mechanical injury. These underground wires pass up through the lamp columns to the globes, and each column is provided with a small door, so that, should it be required, a switch for turning off any particular lamp independently may be used. Machinery for supplying from 1,000 to 5,000 lamps for use in private houses and places of worship is also proposed.

A LEASE of the Doddington Quarries, near Wooler, has been taken by Messrs. Thomas Gibb & Sons, of Auchinlee Quarries, Cleland, from Lord Tankerville, of Chillingham Castle, Northumberland.

IT is computed that about 25,000,000 bricks will be required for the Manchester Ship Canal in the various buildings, &c., connected with the undertaking. In the excavations at Lymm, a bed of clay of superior quality has been found, more than sufficient to make the necessary quantity. Mr. Thomas Walker, the contractor, has laid out a field with all the required plant for the manufacture of upwards of 100,000 bricks weekly, and is making preparations for putting down another mill, which, when completed, will, with the present one, be capable of turning out a quarter of a million weekly. A line of rails has been laid from the excavations to the top of one of Murray's patent wire pug-mills, and the clay is discharged from the waggons direct into the mill.

THE contract for building a new organ chamber for Naburn Church has been let to Mr. William Denison, of Normanton.

C. G. TEBBUTT, Patentee, DASHWOOD HOUSE, 9 NEW BROAD STREET, E.C.

FLOOR WITH GUTTERING

THE additions to the Lintrathen Waterworks at Dundee are making good progress. At present 6,789 tons of pipes and special castings have been delivered; the total length of the new line of piping now completed is 10,724 lineal yards, or 6 miles 167 yards. A stone bridge at Quiech has been finished, and one of the large main valves placed in position at Shanzie sluice-house. The total payments to contractors to date amount to 26,764*l*.

At the last meeting of the Mersey Dock Board a recommendation of the Works Committee was adopted, that the Great Float at Birkenhead should be deepened to the depth attained by the spring tides, by the erection at the east end of the Wallasey Dock of a system of centrifugal pumps similar to those in course of erection at the Coburg Dock. The estimated cost of the work is 45,000*l*.

THE contract has been obtained by Messrs. Osborne & Stevenson, Pollokshields, for the construction of new waterworks at Gourrock, the contract price being about 1,650*l*.

ON Tuesday the Aireside Ironworks, Huuslet, were offered for sale at auction. A bid of 25,000*l*. was made, but the property was withdrawn, and sold afterwards, privately, at a much higher figure.

A NEW railway station at Paisley, the works of which cost about 80,000*l*., and were carried out by Messrs. Morrison & Mason, contractors, was opened for traffic on Monday.

A NEW line of railway, from Glasgow to Ardrossan, was opened on Monday. The dock, which is in course of construction at the latter place, covers an area of 10 acres, and is expected to be finished in about eighteen months. It will then give a depth of 18 feet on the sill at low water, and 27 feet at high water, so that the largest vessel will be able to float in it. In both the undertakings about 400,000*l*. have already been spent, and, when the works are completed, it is estimated that considerably over half a million will have been expended.

AT the meeting of the Salford Town Council, on Wednesday, sanction was given for the construction of public baths for the Ordsal, and also the Broughton district, the cost not to exceed 16,000*l*.

THE industrial holiday, called in America "Labour Day," was celebrated in New York State on Monday by parades of working-men, picnics, yacht races, and other games. In New York city there was a grand parade of 40,000 men in line. A mammoth picnic of the labour classes was held in Phoenix Park, and there was also a grand parade of the Working Men's

Union at Buffalo, followed by a picnic in Germania Park. The holiday was generally observed in the States of New Jersey, Massachusetts, and Illinois. At Trenton, Boston, and Chicago business was generally suspended, and the labouring classes devoted the day to parading and picnics.

A HANDSOME brass lectern has just been placed in Carmarthen parish church, representing a full-size angel bearing on its uplifted arms the Gospel to the four quarters of the earth, which latter is symbolised by the domical base with its four pinnacles and foliage embellished buttresses, separated by elaborately sectioned panels of tracery work. The book-rest is richly engraved and pierced. The style of the lectern is of the Perpendicular Gothic period. The work has been carried out by Messrs. Jones & Willis, of London and Birmingham.

THE owners of the Mersey Mills site, in Heaton Lane, Stockport, have notified their willingness to accept 6,500*l*. for the plot of land required by the Corporation in order to erect a bridge across the river Mersey to Chestergate. A bridge is much required to relieve the traffic at this point and would be the means of greatly improving the centre of the town.

THE Rathbone Co., of Canada, have established an agency in this country, for the purpose of supplying direct, mouldings, doors, &c., at the lowest possible cost. Their depot at 28 Wharf Road, N.—which we inspected recently—contains an enormous stock of mouldings in nearly every description of wood, of perfectly smooth surface and excellent finish. Messrs. Bryce Junor & White are the agents for the Rathbone Co. at the above address, and will forward catalogues on application.

At the Dalkeith Dean of Guild Court, on Monday, Stephen Hair, builder, was charged with having, contrary to the Dean of Guild by-laws, erected an engine-house on the premises in White Hart Street without having plans submitted for approval to the Dean of Guild Court. Mr. Handyside, solicitor, who appeared for Mr. Hair, submitted that the Dean of Guild Court was not the proper tribunal to decide a matter of this kind, and that it ought to be brought before the magistrates in the ordinary way. No penalty was provided in the Dean of Guild by-laws, and therefore a fine was not exigible. The Fiscal said the object in view was to decide whether the builder or proprietor should be held liable for the erection of buildings without the consent of the Dean of Guild Court. The magistrates were unanimously of opinion that a mistake had been made in prosecuting Mr. Hair, and that the proprietor is the proper party to proceed against. The case was dismissed.

THE BANKS OF THE DANUBE.

In an article called "Cœur de Lion's Prison," the Vienna correspondent of the *Daily News* gives some interesting particulars from which the following is extracted. How few, he writes, are familiar with the lovely winding river between Vienna and Passau, in Bavaria. From Krems to Melk the Southern Danube winds its way between vineclad hills. Picturesque castles and proud abbeys adorn the shores and are reflected in its pale-green waters. The splendid Abbey of Göttweih, crowning a hill opposite Krems, is far superior from a picturesque and antiquarian point of view to Monte Cassino, the most celebrated monastery of Italy.

Between Göttweih and Melk one abbey after another, more or less magnificent and picturesque, attract attention and call to mind a wealth of reminiscences. The most lovely little abbey of all, with a church that is a treasury of art, is situated at Dürrenstein. Here precipitous rocks rise out of the Danube, and on a craggy mountain that can vie with some of the lesser dolomites stand the ruins of ancient Tyrustein. No place, even in Italy, unites in so small a space so many reminiscences of old and modern times. From a country which is one great vineyard the town—it boasts the proud name of town, but its seventy houses form little more than a village—is entered through an ancient gateway forming part of a battlemented wall which reaches from the top of the mountain down to the water's edge. Strong circular towers stand out along it at small intervals. These walls, which are 5 feet thick and 40 feet high, are covered with ivy many centuries old, the stems of which are like the trunks of trees. The dark-green leaves in layers a foot deep give a soft outline to the wall. Above the entrance gate, in the churchyard, stand the remains of the oldest church of Tyrustein, which date back to the eleventh century, and are well preserved.

In the old "shooting garden," protected by the ivy-grown wall, are the remains of an immense church and monastery of the nuns of St. Clara, built in the thirteenth century. It was abandoned in 1571, when the last Lady Abbess died, and the property fell to the share of the Abbey of Tyrustein. The family of Küenringer, which owned the castle in the days of Richard Cœur de Lion, died out in the fourteenth century. The Lady Elizabeth, being a widow and childless, resolved to retire to a convent, and gave all her property to the brotherhood of Augustines who founded the abbey, the first abbot, in 1378,

being Stephanus. To Hieronymus, who was Abbot of Tyrustein from 1609 to about 1630, is due the perfect preservation of the church, the abbey, and many other buildings. He restored the church, decorated it in Rococo style, built part of the abbey, and the terraces and towers, from which the eye commands a splendid view of the Danube and the mountains. He turned the old nunnery of St. Clara and its church into enormous barns in which to store the corn that grew on the distant plains beyond the hills.

Perhaps if the abbey, the old castle, the ivy-grown walls, the church, and the convent were shown as curiosities they would not surprise us, or certainly not delight us, half so much as they do. Personally-conducted sightseers are unknown in Tyrustein. We have to discover the place for ourselves. There is a most intelligent and cultivated priest who is prepared to do the honours of the abbey, and, indeed, does them with the grace of a gentleman of the old school. He takes one through the great hall of the abbey with its handsome stuccoed roof and its frescoed walls, opens the shutters of a small turret-room, and leads one on to the balcony, whence the blue hills in the distance and the Danube many hundred feet below are to be seen. The swallows descend in sweeping lines from their nests in the church tower, and rest on the balcony's edge, strangers as they are to the fear of man. A poor artist from Vienna has a delightful summer studio in one of the vaulted rooms. An aged baroness inhabits a suite of rooms which have been hers for many years. The sculptor of the Maria Theresa Monument in Vienna, Professor Zumbusch, is a guest within the abbey walls. Last year, in the early spring, three Americans—a lady and two gentlemen—came down the Danube in a houseboat of their own, and, struck by the beauty of the situation, landed. So charmed were they that they stayed a whole year, with the exception of two bitter winter months, which they spent in Greece. The priest made room for them, and gave them a splendid suite of apartments, one room of which is said to be haunted. Here the choir and the organ in the church could be heard. The happy guests could roam through the hundred rooms of the abbey, or sit in silent contemplation in the church, with its golden light streaming in from an orange-coloured stained-glass window high over the altar, or watch the flitting reflection on the chessboard marble floor of the choir.

A detailed description of the church of Tyrustein would fill a volume. Where the vaulted roof rests on the arches about two dozen beautifully-carved figures are the bearers of

pictures of the Prophets and Apostles. Four graceful girls in their turn hold the four books of the Evangelists. The pulpit is surmounted by a female figure bearing the cross, and representing Faith, whilst Charity with a burning censer and Hope with an anchor are seated at either side. These figures, with half a dozen angels, are carved out of pear-tree wood. There are beautifully carved choir chairs, with high inlaid backs. On the high altar there is a unique work of art, a globe-shaped pyx, which turns on an axis, and has beautifully carved and gilt pictures representing some event in the life of our Saviour. The equator, represented by a broad silver belt, is covered with fine engravings of the Apostles, and of landscapes and pictures of cities in the Holy Land—Mount Olivet, Jerusalem, Bethlehem, the Holy Sepulchre—and long Latin legends are engraved between the pictures. The globe is surmounted by a canopy representing the star-studded heavens with carved angels. An anchor concealing the keyhole bears the inscription, *Dum spiro, spero*. But the contents of this pyx are more precious still. In it is a monstrance 2 feet high, with massive gold figures of God and His angels surrounding a crystal centre in which is the crescent, formed entirely of rubies and diamonds. From all parts of the monstrance hang large precious stones in quaint old settings. The foot is adorned with pictures in enamel of the Holy Supper, the Crucifixion, and bears the arms and initials of Abbot Hieronymus. This monstrance is said to have been stolen by the French in 1805, and repurchased for 60,000 florins by the chief landowner of Dürrenstein.

#### BIRMINGHAM AND LIVERPOOL SHIP CANAL.

ON Tuesday a meeting of the provisional committee was held in Birmingham, to receive the report of the sub-committee which had been appointed to inquire into the details of the scheme.

The report, which was approved by the provisional committee, states that the object has been to report to the general committee from actual inspection as to three main points:—

(1) The commercial facilities which the route would provide; (2) the practicability of the scheme as regards levels, direction, and general methods of construction; and (3) the probability of obtaining land, water-rights, and other requirements. They spent five days in the inspection of the route, in which they were accompanied by Mr. Shepherd and Messrs. Harris,

Martin & Harris, who explained the details of the plan, and pointed out more especially all the places where the principal engineering or other problems arose, and the methods by which it was proposed that they should be solved. As a result, they report:—(1) They regard the proposed line as one which offers very great facilities for the traffic of very important districts. In Birmingham and its immediate neighbourhood, in South Staffordshire, North Staffordshire, and Cheshire, there is a continuous series of industrial centres, the commercial requirements of which would be immensely benefited by the means of direct communication with each other and the sea which would be furnished by the canal. The line suggested has been projected so as not only to offer conveniences to the districts generally, but wherever practical to serve the special requirements of the individual works, mines, and other establishments. (2) The sub-committee do not assume to give skilled scientific opinion as to the details of route, levels, and construction. They, however, feel that as practical men they are able to understand the broad general lines of the question, and to appreciate the explanations and descriptions given by their advisers, and they feel justified in reporting that the scheme as presented is thoroughly practical, and that it is one which can be carried out, considering the important and complicated considerations of the case, at a reasonable and comparatively economical expenditure. The sub-committee were much assisted in arriving at these conclusions by the experience and information gained by the inspection of the Weaver Navigation, from its confluence with the Mersey at Western Point, near Runcorn, to Winsford Bridge. There they saw a canal such as is proposed in actual and profitable working. They were especially interested in the hydraulic lifting apparatus in operation at Anderton, near Northwich, which forms a complete illustration of what will be one of the most important features of the new scheme. The authorities of the Weaver Navigation have promised to offer every possible assistance to the promotion and completion of the undertaking, which completes the navigation, and which would be largely benefited by it. Entertaining very strongly the opinions which they have expressed, the sub-committee believe that a more complete and detailed survey of the proposed route should now be undertaken. To carry out this suggestion, and to provide means for taking the preliminary steps for making an application to Parliament, the sub-committee recommend that a guarantee fund be at once opened. To promote this object, and with the view of obtaining general

APPLY FOR SAMPLE CARDS AND DESCRIPTIVE CIRCULARS.

support to the scheme, they recommend that particulars of what has already been done and what is proposed shall be printed and widely circulated, and that public meetings shall be held in important centres throughout the route, to which the attendance of the municipal and commercial authorities, as well as the general public, shall be invited.

### THE GUILDHALL AT BATH.

THE redecoration of the Guildhall has been proceeded with during the past few weeks, and the work having now been almost completed, the hall will be ready for its accustomed uses in the course of a day or two. A short account of the appearance which the various rooms now present, the *Bath Herald* says, will no doubt be interesting. Some of our readers may recollect the account we gave in this paper of the decorations of the Guildhall when they were completed on the last occasion. The very neglected state in which the rooms have been of late will, perhaps, scarcely bear us out when we say that on that occasion the public were most satisfied with the result, and one and all of our contemporaries were unanimous in their approbation. The general effect was then produced by the employment of compound colours of delicacy of tint, heightened by the use of one positive colour in a leading position. This system of decoration was in advance of the fashion that has run itself to seed in the employment of colours but little removed from drab, that has been the rule of artists for some time past. The present decoration in contradistinction to this is the employment of positive colours, so far moderated that they shall not be staring, relieved only by colours in contrast, or intermingled with the same colour in different degrees of brilliancy, or even moderated still further until they appear in the smaller details pure white.

The work in the banqueting-room has been carried out with great skill, and the general effect is extremely good, the contrast between the present and past appearance being most striking. The idea has been to obtain a totally different effect to the decoration of the grand pump-room, in which the appearance of comfort was the aim. The ceiling and ornamental style have been decorated in pleasing shades of blue, the elegant enrichments having been picked out in harmonious shades, thus forming a bold and striking contrast, and bringing out the beauty of the Classical embellishments. A greater effect

might perhaps have been effected had a few more colours been introduced. The cove has been painted in somewhat similar colours, and the upper cornices are richly decorated in various shades of blue and cinnamon. The handsome frieze which forms so prominent a feature in the room has been given a rich gold background, and the fluted Corinthian pillars, which form another attraction, are very artistically treated, the groundwork being of old gold colour shaded with orange. The capitals have been decorated with a rich gold bronze *en masse*. The walls have a dado of dark oak colour, above which the panels to the cornice are painted a rich peacock blue. Above the cornice the walls are of a much lighter shade, which has the effect of softening the general tone of the room. The coat of arms over the mantelpiece has been decorated in keeping with the rest of the room, and all the doors have been grained a rich dark oak colour, the door heads being relieved with a stencil ornament in buff.

A great change has been wrought in the Council Chamber from the quiet and sombre aspect which it used to bear, and it now has a bright and cheerful tone. The bed of the ceiling has been repainted a rich shade of cream with style and stencil reliefs, and the cove has a fine stencil design which heightens the tone. The dado here is also of a dark oak colouring, above which to the cornice the walls are painted in colours similar to those used in the banqueting-room but a shade lighter. The doors are grained like those in the adjoining room, while the mantelpieces and door heads are picked out in buff colour. The grand staircase the decorators, Messrs. Cotterell Bros., painted with more colours introduced and a very effective scene is presented, forming a proper contrast to the banqueting-room. The ceiling is treated in a warm tone of cream, the enrichments being relieved in blue and terra-cotta. The festooned cornice is decorated in three or four shades of terra-cotta, light blue and cinnamon. The dado is painted in rich shades of dark terra-cotta, above which, to the string-course, the wall is coloured Pompeian red. The wall above that to the cornice is painted the same colour as the wall in the Council Chamber, a light blue. Another decided contrast to the remainder of the interior of the building is presented in the entrance hall. The bed of the ceiling is painted in a shade of greenish blue, with a handsome stencil style decorated in two shades of red and blue counterchanged. The cornice is finished in five shades of harmonising tints, while between the triglyph ornaments there is a suitable stencil design. The walls are painted in Pompeian red with a dado of rich terra-

May be seen in action at the GLASGOW EXHIBITION, No. 877, Class III.

cotta, giving a decidedly warm effect. A Grecian key border runs round the hall. All the brasswork throughout the building has been relacquered. Altogether the work has been done with great taste, and reflects considerable credit upon Messrs. Cotterell Bros., who have carried it out under the direction of Major Davis, the city architect, who selected the colours for the general treatment of the various rooms, and who directed every detail.

#### WOODEN BUILDINGS AT OLYMPIA.

SEVERAL summonses were heard in the Hammersmith Police Court by Mr. Paget, in respect of the wooden buildings erected in the grounds of the Irish Exhibition at Olympia without a license from the Metropolitan Board of Works.—Mr. St. John Wontner appeared on behalf of Mr. Knightley, the district surveyor, the defendants being represented by Mr. Campbell.—The case against Mr. John Henry Rafferty in respect of the arena or grand stand was first taken.—Mr. Wontner said in May last the erection of the arena and other buildings was commenced, and Mr. Knightley wrote to the various parties who had charge of them, giving them notice that they had no right to erect them without a license. He saw Mr. Rafferty, who was one of the executive council, and told him that a license was necessary. Mr. Rafferty sent for the architect, and gave him instructions to apply for a license. An informal application was made, but the buildings were erected and had been in occupation ever since. A fresh application had been made since the issue of the summonses, but the Board had broken up, and a license could not be granted until October 6. As the Exhibition would close about the middle of October, it would be seen that the buildings were used all the time without a license. The parties simply laughed at the Act, but he (Mr. Wontner) should ask the magistrate to teach them to act differently.—Mr. Knightley was called, and said the grand stand overlooked a large open space.—In cross-examination Mr. Knightley said in June last he was told that Mr. Birch, the architect, had made an application to the Board, but it was informal. Drawings of the building were sent in. The Board wished for further drawings, which were promised during the vacation.—Mr. Campbell referred to a plan of the grounds, which showed that the buildings were surrounded by a high brick wall outside of which ran the open road. He said they were 62 feet from the buildings outside the wall.—Mr. Wontner explained that the arena was only 22 feet from another large wooden building in the grounds

described as the Oriental Café.—Mr. Campbell said in the construction of the buildings every suggestion made by Mr. Knightley had been attended to.—In the next case Henry Etherington was summoned in respect of the switchback railway. Mr. Birch was called and said there was delay in getting the drawings of the buildings in consequence of the contractors.—There was a third case against George Baker, who erected the Irish village.—Mr. Wontner withdrew a summons against Mr. Vincent, secretary of Olympia.—Mr. Paget in dealing with the cases imposed a penalty of 40s. upon Mr. Rafferty, and 10s. upon each of the others, remarking that substantially application had been made for the license.—On an application for costs, Mr. Paget said he thought the summonses should have been taken out sooner.—Mr. Knightley said he exhausted every form of entreaty before applying for the summonses.—Mr. Campbell pointed out to the magistrate that the Exhibition was not carried on for a profit.—Mr. Paget granted two guineas costs in the case of Mr. Rafferty, and one guinea in each of the others.

#### A TAY BRIDGE.

ABOUT the end of this month it is expected that the bridge that is being constructed over the Tay to supersede the ferry at Caputh will be finished and opened for traffic. The cost is about 5,000*l.*, and something like 700*l.* yet remains to be raised to relieve the guarantors from responsibility. The bridge consists of three spans, each of the landward ones being 137 feet, and the centre 140 feet long; the roadway has a breadth of 20 feet, and from the summer level of the water up to the bottom boom of the girders is a space of 15 feet, sufficient provision being thus made for the spates to which the river is liable in the spring and summer seasons, and which frequently interrupted traffic by means of the ferry boat. The girders are of the ordinary lattice type, and made of mild steel. The piers up to the water level are hollow cylinders filled with concrete, and resting on a bed of coarse gravel 10 feet beneath the channel of the river, and thence up to the girders they are solid masonry. The floor is also steel of the ridge and furrow pattern, placed longitudinally, and supported by crossed girders at given distances. The girders stand about 11 feet 6 inches high, and a light hand-rail runs along each side of the bridge to prevent passengers slipping through the interstices. The steel floor is covered with asphalt to prevent corrosion, and this,

again, has a topping of gravel. The abutments on the banks of the river are of solid masonry, with stone pilasters in keeping with the cast-iron pilasters on the tops of the piers. The structure was contracted for by Mr. William Arrol. The bridge will be of great value to Caputh and the circumjacent district of the Stormont within a radius of many miles. On Friday and Saturday a bazaar was held on the river side in aid of the funds for the completion of the structure.

**ROBERTS'S RAIN-WATER SEPARATOR.**

THIS useful apparatus, for which Mr. C. G. Roberts, of Haslemere, Surrey, obtained a silver medal at the International Health Exhibition of 1884, besides other awards, has for some years filled up a want by putting pure and soft water always at our disposal. In both town and country there are many who know the value of rain-water, and our normal water supplies are but at best a substitute in many cases for the efficiency of soft water. In certain cases rain-water may be the principal or only source of water supply. The rain that falls on the roofs of dwelling-houses is sufficient in quantity, as a rule, for all household requirements, and from the roofing of farm buildings sufficient water can be collected for horses and cattle, for dairy purposes, and working engines, &c. To collect and store rain-water in tanks is a simple matter; to collect and store it pure is now even a more simple matter, a result which has been secured by Mr. Roberts's invention. Every one knows that in a short time after rain has been falling the roof, pipes, &c., have been washed clean and freed from impurities of dust, soot, and the like. After that has been done, the water may be allowed to flow freely into the storage-tanks. The difficulty, however, has been to collect rain-water without collecting that portion also which has in the first place washed the roofs. And this is exactly the difficulty that the rain-water separator has disposed of. What happens is, that the apparatus discharges all the foul or dirty water, and only stores the clean water. People, it is said, have taken the trouble to have stack-pipes so arranged that they could by hand direct the water when pure enough into the storage tank, but it is not said that they stop up at night to do so, or that even in the daytime they are always able to be on the alert. The rain-water separator is a self-acting and simple contrivance which effectually attains the object desired. Mr. J. Clarke, F.R.I.B.A., among others, who has had them fixed under his

superintendence and had nearly four years' experience of them, has given favourable testimony as to their merits, they having answered admirably. Many persons use the water entirely for cooking purposes, and also for drinking, as though it were practically filtered water. The separator has no resemblance to a filter. It is not meant to purify water, but, as before mentioned, to secure pure water after it has discarded the dirty water. It is made of zinc upon an iron frame, and the centre part, or canter, is balanced upon a pivot. It is self-acting, and directs into a waste-pipe, or foul-water tank, the first portion of the rainfall that washes

FIG. 1.—Horizontal Separator in Normal Position.

off and brings down from the roof soot and other impurities. After rain has been falling for a certain time, the separator cants and turns the pure water into the storage tank. A vertical separator is used where a single stack-pipe carries the water from the roof to the tank. One length of the stack-pipe is removed, and the separator is inserted and fastened to the side of the house. When a building is provided with several stack-pipes connected by an underground pipe leading to the tank, the horizontal separator (fig. 1) should be used; it is

placed underground close to the tank, or in any convenient place, in the line of the main pipe. In addition to the underground separator, it is often convenient to have one for a tank upstairs, to supply water by gravitation to the kitchen boiler, or for other purposes. This separator may be placed just under the roof, on a level with the gutter, in some position convenient of access. Fig. 2 represents a section (through the line YZ, fig. 1) of the horizontal separator after it has canted and has begun to run pure water into the storage tank, after the roof has become clean. This change of position is affected by the gradual accumulation of a small portion of the water in the

FIG. 2.—Section of Horizontal Separator.  
Pure Water Passing to Storage.

chamber J of the canter; when the water reaches a certain height it makes the left side heavier than the right, and the canter turns a little on the pivot M that supports it, so that the water is delivered two inches further to the right than it was before; and whereas it at first ran through N into the waste-pipe, it now runs through O into the storage tank. In a very slight rain the whole of the water when it is not enough to effectually wash the roof escapes through G without making the canter move. When there is more rain than can pass through the hole G, it rises in F and L, and a small quantity

runs over the side of the funnel, slowly filling the chamber J. When J is filled to a certain height it overbalances the canter and makes the water run to storage through O, as shown in fig. 2. As the water sinks in F it also sinks in L, causing the syphon to act and empty the chamber J. Meanwhile some of the water will have been running through the pipe V into the little chamber W, and the weight of this water will prevent the canter recanting until the water ceases to run from the roof. As soon as W is empty the canter rights itself, ready for the next rainfall, the right-hand side of the canter being heavier than the left when it is empty.

#### GLASGOW EXHIBITION.

ON Wednesday last week a delegation of French artisans visited the Exhibition under the guidance of Mr. Hunter, secretary of the Glasgow Trades Council, and Mr. Beveridge, secretary of the Carpenters and Joiners' Association of Scotland. They were received by Bailie Shearer in the Fine Arts Galleries, and cordially welcomed. They were entertained later at luncheon, Bailie Shearer presiding. He expressed the hope that they had seen much to interest and enable them to give a good report when they went back to France. On the part of the delegation thanks were returned to Bailie Shearer and the executive of the Exhibition for the kindness shown them. The delegates said their object was to examine the various sections, and make reports to their respective trades. They trusted that many Scotchmen would visit the Exhibition next year in Paris.

#### STEEL BUILDINGS.

It is obvious that there is great scope for improving upon the iron buildings in use. They are really not iron, but wooden structures covered with galvanised corrugated iron. Such buildings, of course, are inflammable and ill ventilated. The materials do not lend themselves to any artistic effect. In this respect we are much behind Belgian manufacturers.

M. Dauly, manager of the Société Anonyme des Forges Aiseau, is the patentee of a system of steel buildings which has been a thorough success. These structures have been adopted by the military authorities in Belgium, and as many as twenty-one are at present occupied by the staff of officers, amongst

WEAVER, C.E., F.C.S., Sanitary Surveyor, free by post.

THE DOMESTIC ENGINEERING AND SANITARY APPLIANCES COMPANY, 24 HIGH HOLBORN, LONDON, W.C.

whom is the celebrated General Brialmont, superintending the construction of forts on the Meuse. The French military authorities have also made recent purchases. Many residences consist of these steel buildings—clubs, hotels, &c. The buildings are composed of a system of stamped steel plates, which are strengthened and at the same time ornamented by relieved surfaces, similar to the face of cut stone panelling, and these plates have perpendicular flanges round the edges. By the use of a comparatively small number of models—that is, of plates representing parts of panelling, columns, architraves, and lintels—all architectural combinations occurring in the construction of walls can easily be produced. For this purpose the sizes of the panels are multiples of the same dimensions, which is the breadth of the smallest piece employed (architraves of windows), and in the centre of each division the flanges of the panels are perforated. The panels are placed in horizontal courses, to form the two faces of the walls. Between each course a flat iron tie is interposed, the breadth of which determines the thickness of the wall. The lower flanges of the panels are bent over the joints to prevent the rain from penetrating.

These improved buildings do not need any prepared foundations, unless the ground is very irregular, but are placed direct on the levelled ground, having as a base two rigid frames of L-shaped iron, strengthened and tied at the distance of the sides of the walls. The ceilings are formed of stamped metal sheets, which are placed on the lower wings of the irons which form the beams, with which they are securely connected. If required, the ceilings can be made sufficiently strong to support a fireproof flooring. The inner chimneypieces or fireplaces are easily executed with the ordinary shape of marble chimneys, by means of panels of the sheet metal. Ventilation is carefully provided for, the air circulating freely in the space between the two faces of the exterior walls. This space communicates with the interior of the rooms by holes provided in the skirtings, and it is also in communication with the space between the roofing and the last, or uppermost ceiling of the building. By furnishing the chimneys with large openings above, and allowing sufficient size, ventilating shafts are produced, which by the heat of the smoke flues in winter draw up and lead out the air of all the rooms, each room being, according to the principle of good ventilation, provided with sufficient air inlets and with regulating devices for the same. The mode of ventilation is characterised by the continuous passage between the sides of the exterior walls. This circulation attains a velocity

of about 3 feet per second, and prevents the cooling of the rooms by the outer air in winter, and the heating by the action of the sun in the summer.

We have the result here of a thoroughly artistic building, adaptable to any kind of design, made throughout of steel—with provision for every comfort—at a cost certainly not higher than the rude iron buildings they will supplant.

Messrs. Davies, Codner & Co., of 175 Upper Thames Street, E.C., have made arrangements to purchase the English and Colonial patents of the Danby system, and to manufacture in this country. Mr. Davies, the senior partner, has been in the iron trade for many years, and is thoroughly alive to the great advantages possessed by these steel buildings. He has been over to Belgium to watch every process of manufacture, and to inspect the erections in various towns in Belgium. We certainly predict a success for the undertaking, which meets a great want, assuming that the buyer of a building has some regard for architectural effect.

#### IRON FIREPROOF CURTAIN.

THE iron fireproof curtain for the Theatre Royal, Halifax, is the invention of Mr. T. W. Stead, of the firm of Messrs. Elkanah Hoyle & Sons, engineers, Waterside, Halifax, and is the first of the kind that has been erected. It is in two equal parts, one part when open being under the stage, the other part above the proscenium, the lower half being attached by strong steel ropes over groove pulleys fixed above the gridiron to the top half of the curtain, and by the top half being made 1-12th heavier than the lower half and a water-tank combined, has sufficient power by gravitation to pull up the lower half, and the top part descending in the same ratio meet in the centre and completely closes the proscenium opening. When the curtain is required to be opened it is arranged by a screw valve, which, by turning water into the tank, forms an effective weight over the top part of the curtain, and by so doing the lower part descends and the top part ascends, and is left in this position until required to be closed. In case of fire or panic the curtain can be closed in 30 seconds by simply moving a lever, which is attached to an outlet valve on the tank, and as soon as the water is discharged, the top curtain, by being heavier than the lower one, draws it up to it as described before. The curtain works in slides fixed to the 15-inch brick wall, which is built from the basement to 2 feet above the roof, thus

# FIRE! FIRE! FIRE!

## GRIFFITHS' "PYRODENE" FIREPROOFING LIQUID

(NON-POISONOUS).

Transparent Liquid for Rendering Woodwork Uninflammable,

Without altering its appearance, and where Painting is not desired, such as Wooden Fittings in Exhibitions, Churches, Pews, Matchboarding, Theatre Scenes, Wooden Stairs, Joists, Beams, Floors, Factories, Stables, Mills, &c., in fact, Structures of an inflammable nature of all descriptions. Acts as a priming for new Woodwork for Paint or Varnish. Also for rendering Theatrical and Ball Dresses, Curtains, Paper, Felt, Canvas, &c., perfectly uninflammable.

Griffiths' Liquid penetrates the pores of the wood. It lasts as long as the wood itself. It prevents Dry Rot and decay in house timbers. It does not crack, peel, or rub off.

It is perfectly innocuous and free from smell. It will keep any length of time. Any one can apply it. One gallon will cover double that of any other priming.

All Woodwork in new houses should be fireproofed with this liquid, the cost is so trifling in comparison with the preservation of the timber and freedom from risk of fire. If work is desired to be painted afterwards, Griffiths' Pyrodene Paint is best for the purpose.

AND

## GRIFFITHS' "PYRODENE" FIREPROOF PAINT.

READY FOR USE. NON-POISONOUS. ALL COLOURS.

This Paint is manufactured for preservative and decorative purposes equally as for its FIRE-RESISTING qualities. The Fireproof Paint and Fireproofing Liquid is used at some of the principal Theatres in the United Kingdom.

#### RECENT TESTIMONIALS.

From Messrs. MAXWELL & TUKE, Architects, 29 Princess Street, Manchester: December 28, 1887.

DEAR SIRS.—We used your Paints in nearly the whole of the works for the Royal Jubilee Exhibition, and with very satisfactory results.

Yours truly, MAXWELL & TUKE.

To Messrs. Griffiths Bros. & Co., Dashwood House, London, E.C.

From S. C. LOWE & SON, House Decorators, 32 Cavendish Street, Stretford Road, All Saints, Manchester: November 22, 1887.

DEAR SIRS.—In reply to your inquiry, we, as one of the contractors for the painting of the Manchester Jubilee Exhibition, which closed on the 10th of this month, have pleasure in stating that both your "Aqual" Paint, and also your "Pyrodene" Fireproof Paint, have given great satisfaction. We found them work easily with a covering power of from 30 to 40 per cent. over ordinary paint. Although applied during intense frost, and having been subjected to an almost tropical summer, followed by the drenching rains of this autumn, they are as fresh in colour and have as firm a grip as when applied, and appear quite unaffected by the nine months' exposure. We consider them, therefore, well adapted for all work in any climate.—Yours truly,

To Messrs. Griffiths Bros. & Co., London.

S. C. LOWE & SON.

CHEAPER AND MORE DURABLE THAN ORDINARY PAINT.

GRIFFITHS' "PYRODENE" FIREPROOFING COMPANY, Limited,  
4 & 5 DASHWOOD HOUSE, NEW BROAD STREET, E.C., LONDON.

entirely separating the stage from the auditorium. It is made of two sheet-iron plates, each 1·10 inch thickness, and put together with girder iron, leaving an opening of 3 inches between the sheets of iron, this answering as an air-passage in case of fire, and by a rush of air up this opening keeps the outer plate comparatively cool. The proscenium opening is 21 feet 6 inches by 24 feet, the weight of the curtain is 73 cwt., and the breaking strain of the steel ropes by which it is suspended is 27 tons.

### RUSTING OF IRON.

A PAPER by Professor Crum Brown, on "The Chemical Processes involved in the Rusting of Iron," was read by Dr. Gibson at the meeting of the Iron and Steel Institute in Edinburgh, as follows:—

In this short paper there is, so far as I know, no new fact described. I believe everything, or nearly everything, in it is to be found in the records of chemical research; but as I find that the process involved in the rusting of iron is often misunderstood, I have thought it might be worth while to put together the known facts in their connection.

My attention was first called to the subject by observing what happens when a drop of rain falls on a clean bright surface of iron. At first, for a short time, the drop remains clear, and the bright surface of the iron is seen through it; but soon a greenish precipitate forms in the drop, and this rapidly becomes reddish-brown. The brown precipitate does not adhere to the iron, but is suspended in the water, and becomes a loosely adherent coating only when the water has evaporated. I may premise that, in speaking of rusting, I mean the formation of rust on the surface of metallic iron exposed to ordinary atmospheric conditions. It has been conclusively shown that the necessary conditions for the production of rust are—(1) metallic iron; (2) liquid water; (3) oxygen; and (4) carbonic acid—both the latter being dissolved in the liquid water. Iron remains quite free from rust in an atmosphere containing oxygen, carbonic acid, and water vapour, so long as the water vapour does not condense as liquid water on the surface of the iron. Let us consider now the action on iron of the three substances, liquid water, oxygen, carbonic acid, singly and then two and two. Liquid water, quite free from dissolved gases, does not act on iron at ordinary temperatures. At high temperatures, very rapidly at a red heat, iron is oxidised by

water or water vapour, and is converted into the magnetic oxide of iron. This magnetic oxide is formed on the surface of the iron as an adherent coating, and only when it is detached can the water gain access to lower layers of the iron. Oxygen gas alone does not act at ordinary temperatures on iron. At high temperatures it also converts the iron into the magnetic oxide, which forms an adherent coating. The same is the case with carbonic acid gas, acting alone. At ordinary temperatures it is without action. At high temperatures the carbonic acid is reduced to carbonic oxide, and the iron is oxidised to magnetic oxide, which forms an adherent coating. Liquid water with oxygen dissolved in it does not act at ordinary temperatures on iron.

This is shown by the fact that ordinary water, exposed to the air, does not rust iron if the water contains a substance such as lime, or caustic alkali, capable of combining with carbonic acid and itself without action on iron. As long as the lime or caustic alkali is there, no rusting occurs. When the lime or caustic alkali has been converted by the carbonic acid of the air into carbonate, then, and not till then, can the carbonic acid of the air dissolve as such in the water, and then, and not till then, does rusting begin. Water containing carbonic acid dissolved in it acts on iron at ordinary temperatures, forming ferrous carbonate, which dissolves in the carbonic acid water, forming, no doubt, ferrous bicarbonate. In this way artificial chalybeate water has been prepared by shaking up finely divided iron with carbonic acid water. In this action hydrogen gas is given off. Solutions have been thus prepared containing nearly 1·10 per cent. of iron. If oxygen is present dissolved in the water, it will unite with the nascent hydrogen, and if we have sufficient water, iron, and carbonic acid, the whole of the dissolved oxygen will be thus consumed. The presence of dissolved oxygen quickens the solution of the iron, the tendency of the oxygen to combine with the nascent hydrogen supplying an additional motive to the action. Probably in ordinary rusting no hydrogen actually becomes free, as under ordinary conditions there will always be enough dissolved oxygen to convert all the nascent hydrogen into water. When a solution of ferrous bicarbonate is exposed to an atmosphere containing neither free oxygen nor carbonic acid, it loses carbonic acid, and insoluble ferrous carbonate is precipitated. If free oxygen is present in the atmosphere to which it is exposed, the ferrous carbonate is oxidised to ferric hydrate, carbonic acid being given off. This, if the water is not already saturated with carbonic acid, dissolves in the water.

We can now follow the whole process of rusting, and divide it into stages—these stages being really separable, if we take proper precautions, but in the usual case overlapping one another. We have, first, the formation of soluble ferrous bicarbonate; secondly, the conversion of ferrous bicarbonate into ferric hydrate, the white ferrous carbonate passing through green and black intermediate substances into the reddish-brown ferric hydrate, *i.e.* rust. We have to note that the carbonic acid dissolved in the liquid water, which is necessary for the process of rusting, is not used up in the process. It is given off during the oxidation of the ferrous bicarbonate to ferrate hydrate, and is thus ready to act on the new surface of the metallic iron. The continuation of the process of rusting is not, therefore, dependent on new carbonic acid absorbed from the air, but the original carbonic acid, if not removed, can carry on the process indefinitely, as long as liquid water is present, and oxygen is supplied from the air. Once the process is started, it goes on more rapidly, because the porous rust not only does not protect the iron, but favours, by its hygroscopic character, the condensation of water vapour from the air in liquid water. A piece of iron, therefore, which has begun to rust, will continue rusting in an atmosphere not saturated with water vapour, an atmosphere in which a piece of clean iron will not rust, because liquid water will condense from such an atmosphere on the hygroscopic rust, but not on the bright iron.

#### LAMBETH POTTERIES.

On Thursday last week Sir Henry Doulton appeared to a summons at the Lambeth Police-court under the Smoke Nuisances Act, for using a furnace so that smoke was not effectually consumed. Mr. St. John Wontner appeared to prosecute on behalf of the Home Office. The evidence was to the effect that on the day in question Police-constable 9 LR saw dense black smoke rising from one of the kilns of Messrs. Doulton's pottery. It continued for ten minutes. Mr. Wontner said it might be arguable whether Sir Henry Doulton was liable, but he contended that he was, and proceeded to read the section of the Act bearing on the case. Mr. Biron said he could not see how the section applied. In cross-examination by Sir Henry Doulton, the constable said that for eighteen months there had been a great improvement in the smoking of the kilns at the works. He knew that a foreman and others had had strict

orders to do everything possible to avoid smoke. After some further evidence, Mr. Biron said he thought the defendant was not the responsible person. He had without doubt spent thousands of pounds, and used every effort by the application of proper apparatus to prevent the nuisance. The defendant had given full and strict instructions also to his foreman and stoker to fully see to the regulations, and he could do no more. He certainly should not convict under such circumstances, for it was evident that if any one was responsible it was the foreman or stoker. He dismissed the summons. Mr. Wontner said he would consult with the Home Office as to a case being granted. Mr. Biron said he would grant a case if necessary.

#### TEST OF A PASSENGER-LIFT.

THIS test had reference to the safety of one of Messrs. Archibald Smith & Stevens's "Reliance" suspended lifts. To make clear its significance it is necessary to refer to the frequent failure of so-called "safety-gears" when unexpectedly called upon under working conditions, even though such gears have satisfactorily passed a form of test at the time of erection. The explanation of the discrepancy between the behaviour under test and under working conditions may be found in the nature of the test applied. The usual course is to suspend the cage by means of a short piece of temporary rope which is cut through close to the top of the cage, the grip gear being previously well oiled and everything ascertained to be in working order. These are conditions under which almost all safety-gears would act, but conditions which never exist in practice, and hence the disappointing result. When a rope or chain breaks in actual work it is because it is worn out, and the point of fracture will be that of greatest wear, but will never be close to the cage. In the case of a hydraulic lift with multiplying cylinder this point will be found somewhere among the wheels of the cylinder. In the case of a lift driven by winding gear it will be found in that part of the rope passing over the drum or V-wheel. In all cases the fracture will occur at some distance from the cage, with the loose ends entangled among the machinery, and probably a heavy weight of loose rope or chain hanging from the off side of the overhead wheel, dragging the safety-gear out of action. Before the safety-gear can act it must pull the loose ends through the machinery, sometimes over or under six or seven wheels, and lift up the deadweight of rope referred to. If not sufficiently powerful

### ESTABLISHED 1817.

### ILLUSTRATED CATALOGUES AND PRICE LISTS ON APPLICATION.

for this duty, it will allow the cage to fall, restrained only by the back drag of the rope which is preventing the action of the grips. This explains a peculiarity attending many lift accidents, viz., that though the cage has descended from a considerable height, the speed attained does not approximate to that due to free fall. We know of one case in which a man fell 60 feet in a lift-cage, and was walking about within a week apparently uninjured. The ordinary safety-gear has the additional defect of being normally held fast in one position, and at the critical moment may be found to be set fast.

Passing now to the special test under notice, it is only necessary to premise that the "Reliance" gear is designed to act upon the failure of any one of the lifting ropes; that it has for its motive power the weight of the cage and load, so that the greater the load the greater is the effectiveness; and that it is actuated by the opposing pull of two ropes in a series; that is to say, should a given rope break, the safety action depends upon the tension of one particular rope among the survivors, each rope having its own proper opponent. It follows that should any pair of ropes be relieved of tension by the tightening of the remaining ropes, and that then one of the slack ropes should be fractured, its complementary slack rope would be in the worst conceivable condition for actuating the grips.

The lift tested (a "Reliance" suspended lift) was worked by a hydraulic multiplying cylinder fixed at the bottom of the building. The rise of cage was 88 feet, the load lifted 11 cwt., and the weight of cage 10 cwt. The safety-gear had remained without special attention for nearly two years; it was taken just as found, and not even oiled. A pair of ropes was purposely slackened as above described, on the assumption that a careless attendant might make such a mistake. The cage was taken to the top of the building and left empty, i.e. with the smallest motive power for the grips. The point of greatest wear in the rope was calculated and checked by observation, and found to be 150 feet away from the cage end, having five wheels between it and the cage. Of the 150 feet of rope 100 feet hung vertically, representing a weight of 50 lbs. pulling against the gear. Under this accumulation of adverse conditions, one of the slack ropes was then cut through, 150 feet away from the cage, with the result that the safety-gear went into action, preventing the descent of the cage when the valve was reversed for lowering. The cut rope was then replaced by a new one, and all the ropes were adjusted to equal tensions. The cage was again taken to the top of the well, and loaded with 5 cwt. of iron representing an average load of passengers.

These conditions were a nearer approximation to those of ordinary working, and altogether more favourable to the safety apparatus. A second rope was then cut at a similar point measured 150 feet from cage, resulting, as was expected, in an even sharper and more decisive locking of the gear than in the first experiment. A duplicate set of gear was tested with a ton of iron in the cage, with equally satisfactory results.

As already intimated, the ropes had done nearly two years of incessant work. A piece was cut out of the worst part of one of them and sent to Mr. Kirkaldy to test to destruction. Appended is a copy of his certificate:—

Results of experiments to ascertain the tensile strength of one piece of steel wire rope with fastenings received from Messrs. Archibald Smith & Stevens.

Test No.	Circumference in Inches.	Hemp Core.	Ultimate Strength.		Position of Fracture.
			Lbs.	Tons.	
W. 1318	1.90	Main and Strands.	15,495	6.92	Two strands broke together, others separately. All clear of fastenings.

The rope having been in use, and having broken wires, the extension was consequently not taken.

(Signed) DAVID KIRKALDY & SON.  
99 Southwark Street, London, S.E.

#### PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Cassell, Consulting Patent Agents, 43 Southampton Buildings, Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

#### APPLICATIONS FOR PATENTS.

12225. Karl Bernhard, for "An improved safety contrivance for windows." August 24, 1888.

12234. John Adair, for "Improvements in the heating and cooling of bakers' and confectioners' ovens." August 24, 1888.

## JAMES CARTLAND & SON, BIRMINGHAM. CABINET, BUILDERS', AND FURNISHING BRASSFOUNDERS, LONDON SHOW-ROOMS: 40 HOLBORN VIADUCT.

N.B.—The Show-Rooms, both in London and Birmingham, are replete with Patterns of every description of Brass Foundry. Buyers are respectfully invited to inspect same. LONGBOTTOM'S PATENT ADJUSTABLE LOCK FURNITURE. MADE IN BRASS, WOOD, AND CHINA. ADOPTED BY HER MAJESTY'S BOARD OF WORKS.

The attention of Architects is called to this Patent Lock Furniture as being the simplest and most reliable yet offered to the public, and whilst embracing all the features requisite in a perfect mechanical device, the total absence of defects usually found in Door Furniture still further enhances its value. In fixing insert the spindle into follower of lock, slip on rose, and screw the loose nut upon spindle until the right adjustment is obtained, then push on the other knob, the key passing through the nut and rose, turn rose half round and screw to door. They are as easily taken off as they are fixed, they cannot get out of order, and are suitable for all kinds of locks and every description of furniture.

Samples and Price Lists on application.

## BANFIELD'S IMPROVED PATENT INDICATOR,

For Closets, Lavatories, Bath-Rooms, Offices, &c.

Liberal Discount to the Trade.

#### PRICES.

Lacquered Brass, 4/6; Bronzed Brass, 4/9; Nickel-plated, 6/1; Japanned Iron Lock with Brass Indicator, 3/6.

This Lock supplies a want which has long been felt for a reliable and inexpensive means of showing when an apartment is engaged. By simply turning the handle, the door is locked and the word "Engaged" shown on the outside. Conversely, the act of unlocking withdraws the word from view. This Lock is a distinct improvement over all others; there are no wheels to clog, the working parts are covered, and it cannot fall to indicate accurately. It is very neat in appearance, the acme of simplicity, and the cheapest contrivance of the kind yet introduced. It can be easily attached to doors of any thickness, or either hand. A loose key can be supplied at a small extra cost for opening the lock from the outside, an advantage possessed by no other Indicator. The principle can be applied to existing locks, either mortice or rim.

To be obtained of the Patentee, E. BANFIELD, BRIGHTON, Sussex, and of all Ironmongers.

## VOLUME XXXIX. OF THE ARCHITECT.

Handsomely bound in Cloth, Gilt Lettered. Price 12s. 6d. Office: 175 Strand, London, W.C.

12258. Thomas Whittaker, for "Improved hinges for folding-doors and screens." August 25, 1888.

12263. James Gamble, for "A contrivance to hold paper while writing or sketching." August 25, 1888.

12283. Charles Carr Wilson, for "Improvements in gas stoves." (Complete specification.) August 25, 1888.

12325. William Yelland, jun., for "Improvements in sash fasteners." (Complete specification.) August 27, 1888.

12330. William de Morgan, for "Improvements in or connected with the construction of walls or other brick structures." August 27, 1888.

12350. John Elwell, for "A portable covering or roof in galvanised, varnished or painted, corrugated or plain sheet iron or steel, for roofs of hay, corn, or other stacks, booths, temporary buildings, &c." August 28, 1888.

12370. Samuel de la Grange Williams, for "New or improved burners for heating limekilns and brick and other kilns by the combustion of gas, and for other like purposes." August 28, 1888.

12397. William Phillip Thompson, for "Improvements in sewer-gas excluders." (William Wallace, United States.) (Complete specification.) August 28, 1888.

12408. John Rashleigh Banfield Rashleigh, for "Improvements in means or devices for facilitating the insertion of nails, screws, and other fastenings into brickwork, concrete, or other masonry, and for insuring the retention of the same therein." August 28, 1888.

12415. John Meysin Porter and John Arthur Wright, for "An improvement in fastenings for doors and windows." August 29, 1888.

12470. Gurney Lindoe Falconer, for "An improved method of framing sash windows, doors, or shutters." August 30, 1888.

#### PROVISIONAL SPECIFICATIONS ACCEPTED.

10343. John Robinson Crosthwaite, for "Improvements in the combination of materials employed in the construction of chimneypieces, mantelpieces, or the like structures." July 17, 1888.

10506. John Alfred Radley, for "An improved centrifugal pump." July 20, 1888.

10557. William Iredale and John Haigh, for "A new or improved apparatus for automatically regulating the supply of water or other liquids to cisterns, tanks, or other like reserves." July 21, 1888.

10578. Anthony Dunderdale, for "Improvements in collapsible or folding-shutters, window-guards, sunshades, gates, balconies, and the like." July 21, 1888.

10586. Alexander McLean, for "Improvements in blocks or slabs for paving and other purposes." July 21, 1888.

10669. George Albert Herdman, for "Improvements in the preparation of asphalt for pavements, roadways, buildings, bridges, and other applications." July 24, 1888.

10706. George Evans, for "Improvements in construction of window frame and hanging sashes." July 24, 1888.

10721. Alfred Vincent Newton, for "Improved safety appliances for building in fire." (Alfred Nobel, France.) July 24, 1888.

10757. Frederick Wendling, for "A new paint for stone, plaster, and the like." July 25, 1888.

10824. Charles Torkington, for "An apparatus to prevent the shaking of window sashes." July 26, 1888.

10870. John McLeownan McMurtrie, for "Improved apparatus for fire extinguishing, applicable also for preventing bursting of water pipes." July 27, 1888.

11434. John Jackson, for "Improvements in expansion joints for hot-water or steam-pipes." August 8, 1888.

11775. Regd. Haddan, for "An air purifier and cooler." (Gabriel Paul Stienne, Bruneau, France.) August 15, 1888.

11887. John Casthelaz and Samuel Bruere (of the firm of John Casthelaz, Bruere & Co.), for "Improvements in the manufacture of drying oils, varnishes, and dryers." August 17, 1888.

#### COMPLETE SPECIFICATIONS ACCEPTED.

Notice is hereby given, that all persons interested in opposing the grant of a patent on any one of the undermentioned applications may, at any time within two months from the date of the official *Journal*, give notice at the Patent Office in the prescribed form of such opposition.

14460. Philip John Davies, for "Improvements in sink-cones and sink-traps, and casting them with lead." August 24, 1887.

14556. John Stones, for "Improvements in the construction and working of fireproof, iron, and other curtains or screens for theatres and large openings." October 26, 1887.

14601. Thomas Ralph Douse, for "Improvements connected with apparatus or means for checking or subduing fire in buildings and ships or vessels." October 26, 1887.

14630. Wm. Berthold Ihne, for "Improvements in ladders." October 27, 1887.

14639. Henry John Alexander, for "Improved arrangement of ventilator for shafts, pipes, roofs, and the like." October 27, 1887.

14734. Samuel Carnaby, for "Improvements in apparatus or appliances for turning, opening, or closing venetian blinds, ventilators, well-balanced windows, and other objects of a like nature." October 29, 1887.

683. Will. Chas. Adolphus Holzapfel, for "An anti-corrosive composition for the protection of the inside of iron and steel vessels, bridges, piers, and other structures which may be exposed to the action of the atmosphere or water." January 16, 1888.

3181. Edwin Hargreaves, for "Improvements in wire door-spring fittings as regards the adjustment of the torsion on the steel wire or rod." March 2, 1888.

10527. Alf. Julin Boulton, for "Improvements in machines for lifting and delivering bricks and other materials." (Carl Heinrich Eichler, Germany.) July 20, 1888.

#### PATENTS SEALED, AUGUST 31, 1888.

10426. Thomas Moore, for "Improvements in lifters and fasteners for skylights, fanlights, window-sashes, trap-doors, and the like." July 27, 1887.

11324. Joseph Smith and Albert Roberts, for "Improvements in lavatories and in apparatus connected therewith." August 19, 1887.

11362. Henry Harris Lake, for "An Improved parallel ruler." (Benigne Louis Aquettant, France.) August 19, 1887.

11587. John Holt, for "Improvements in latches and bolts for doors and the like." August 26, 1887.

12524. George James Snelus, William Whamond, and Thomas Gibb, for "An improved preparation in the manufacture of cements." September 15, 1887.

12855. John Empson and John Hewitt, for "Improvements in handle and fittings for closet and bell-pulls, and similar purposes." September 15, 1887.

14394. George James Snelus, William Whamond, and Thomas Gibb, for "An improved manufacture of cements." October 22, 1887.

2788. Thomas Austin Sergeant and William Edwin Cook, for "Improvements in mitreing machines." February 24, 1887.

2833. William Illsley, for "Improved means of lubricating moving bars, of clay in or connected with machinery for the

manufacture of bricks, tiles, drain-pipes, and the like." February 25, 1888.

6940. Delley Dietrich Lench, for "Improvements in water-closets, and means for disinfecting the same." May 9, 1888.

7305. Thomas Constantine Fawcett and James Dawson Fawcett, for "A new arrangement of toggle-jointed levers for imparting a double pressing motion for use in moulding, pressing bricks, tiles, fuel-blocks, and other articles." May 17, 1888.

8020. Sydney Turner, for "An improved roof tile." June 1, 1888.

#### NOTES ON SPECIFICATIONS RECENTLY PUBLISHED.

"Improvements in the hearths of fireplaces, fenders, &c., &c." No. 11237. 1887. H. Noble, Little London, Leeds; and G. Haley, 36 Green Street, Leeds. This invention relates to forming enamelled designs upon metal hearths, in imitation of tiles or other ornamental devices. The enamelled surface of the metal hearth acts as a radiator to throw off the heat from the fire into the room. This invention is also very applicable for wall dadoes on account of the ease of fixing.

*Claim I.*—Metallic enamelled hearths and fenders for fireplaces, substantially as shown and described.

*Claim II.*—Metallic enamelled wall dadoes, substantially as shown and described.

"Improvements in the construction of roofs." No. 13680. 1887. J. Season, Hunslet Road, Leeds. This invention refers to the construction of roofs formed entirely of iron and slate, and has for its object the securing in a simple and effective manner the slates to the ironwork of the roof.

"Improvements in apparatus to prevent the bursting of water-pipes by frost." No. 13976. 1887. W. H. Moore, 28 Denmark Hill. This seems a very useful invention, and consists in forming a space or chamber in the pipe, but larger than the pipe, and placing therein a ball or india-rubber bag charged with air. When the water in the pipe expands in freezing, it compresses the air in the ball or bag, and so relieves the pipe from additional pressure.

*Claim.*—Apparatus substantially as described, to prevent the bursting of water-pipes by frost.

TO INVENTORS.—Patents for Inventions, Trade-marks, and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CASSELL, Patent Agents, 43 Southampton Buildings, Chancery Lane.

# ART DECORATORS AND FURNISHERS.

## High-class Furnishing Art Decorations.

198, 200, 202, 204, 206, 208, 210, 212,  
WESTMINSTER BRIDGE ROAD,  
LONDON.

## ATKINSON & CO.

Undertake Decorations of every description  
in conjunction with Furnishing, which in-  
sures perfect harmony of style, colour, &c.,  
and the satisfactory execution of all orders  
entrusted to them.

Designs and Estimates on application.

THE BEST SELECTED STOCK OF FURNITURE,  
CARPETS, &c., IN LONDON.

**JOHN MILNER,**  
ANTIQUE FURNITURE DEALER  
AND CABINET MAKER,  
180 GT. PORTLAND STREET,  
LONDON, W.

Carved Oak, Chippendale, and other Styles  
of Genuine Antique Furniture,  
Oak Panelling, &c.  
ANTIQUE FURNITURE CAREFULLY RESTORED, and  
OLD OAK PANELLING MADE UP and FITTED.

## OAK PANELLINGS And INTERIOR DECORATIONS.

A Specialty. Antique and Modern.

## MR. J. ICHENHAUSER,

Of 68 NEW BOND STREET, W.,  
Is prepared to give ESTIMATES for

Panellings, Ceilings, Mantelpieces,  
all Styles and Periods.

FINEST CARVED WORK ONLY.

The Architect, Sept. 23, 1887, says of some of Mr.  
ICHENHAUSER's work:—"It is a triumph of the art of  
wood sculpture."

The Building News, Oct. 8, 1886, says:—"Forms one of  
the finest panellied rooms we have seen."  
Antique Furniture, Rare Old Stained Glass,  
Antique Cordovan Leathers, Tapestries, &c.  
CALL OR WRITE.

**HOBBS, HART & CO.**

(LIMITED),

76 CHEAPSIDE, LONDON.

MAKERS TO HER MAJESTY, BY SPECIAL APPOINTMENT A.D. MAY 13, 1876.

**STEEL STRONG ROOMS, DOORS,  
LOCKS, AND SAFES**

TO THE BANK OF ENGLAND AND ITS BRANCHES,

*Including the New Law Courts Branch now in course of Erection.***IMPORTANT COMMUNICATION. — WHITELEY'S FIRE.**

WILLIAM WHITELEY, Westbourne Grove, London: October 12, 1887.

HOBBS, HART &amp; Co., Limited.

GENTLEMEN,—It affords me very much pleasure to express to you my satisfaction and admiration at the splendid fire-resisting powers of your Strong-room Doors and the Safes.

The recent fire at my establishment, in my opinion, subjected them to the greatest possible test, and through all they proved invulnerable. The contents of both Strong Rooms and Safes were entirely preserved, although the fire was of such intense destructive force.

You will be pleased to hear that it has been decided to adopt your Patent Clutch Rebated Doors for all the party walls in the new buildings now in course of erection.—I am, Gentlemen, faithfully yours,

(Signed) **WILLIAM WHITELEY.****KALLKOLITH.**

NEW PATENT PRIMING AND STAIN.

*Acknowledged by experts of nearly every country to be one of the most important inventions of the Nineteenth Century.*PATENTED IN  
England,  
Belgium,  
France,  
Germany,  
Italy.

TRADE MARK.

PATENTED IN  
Austria-  
Hungary,  
Denmark,  
United  
States  
of America.**KALLKOLITH** is one of the most marvellous inventions of the present age, and is used as a priming in place of the now almost obsolete oil-colour. It produces an exquisite smoothness, combined with great durability, and amalgamates thoroughly with wood, iron, cement, stone, plastering, &c.**CHEAPNESS.**—It saves at least 100 per cent. in comparison with any other priming now in use, being less than half the weight.**ECONOMY** is manifested by the fact that one 14-lb. tin of **KALLKOLITH** goes further than three times the same quantity of oil-colour.**DRYING POWERS.**—It dries within one to two hours, thereby greatly facilitating the quick dispatch of labour.**DURABILITY.**—Where **KALLKOLITH** is used it imparts an amount of durability to all oil-colours used upon it which has never yet been obtained, and one of the most important advantages in its use is that the paint put upon it does not blister.**PAPER-HANGING.**—Walls prepared with **KALLKOLITH**, thinned with seven parts of water, give a great additional advantage to the hanging of all descriptions of papers.**TESTIMONIALS.**

21 New Bridge Street, London, E.C.: February 23, 1886.  
I have had some trials made with the **KALLKOLITH** during the past few weeks, the results of which are very satisfactory. The **KALLKOLITH** is to be used as the first coat of paint on wood and other substances, and is of such a nature that the ordinary work in preparing for paint is considerably lessened, and the usual number of coats now given reduced, and, once fairly introduced in the market, I am certain there will be a large sale.  
J. WM. STEVENS, Architect and Surveyor.

75 Newman Street, Oxford Street, W.: Feb. 15, 1887.  
We are pleased to tell you that the **KALLKOLITH** supplied to us has been fairly tried, and we find that it answers all that you claim for it.  
CAMPBELL, SMITH & CO.

Price per case of 8 Tins of 14 lbs. each, net 40s., packing included. Special terms to Wholesale Buyers and Shippers.

Address—**KALLKOLITH CO., 175 STRAND, LONDON, W.C.**

Printed by SPOTTISWOODE & CO., at No. 5 New-street Square, E.C., and published for the Proprietors by P. A. GILBERT WOOD, at the Office, No. 175 Strand, W.C., London.  
Friday, September 7, 1888.

# The Architect.

## THE WEEK.

THE proceedings of the British Association were brought to a close on Wednesday evening with a banquet given by Mr. HAMMOND, the Mayor of Bath, which was attended by about 150 leading members of the Association. At the formal closing meeting of the Congress, which was held earlier in the afternoon, a special recognition was made on the part of the Association of the reception accorded them in the city of Bath. It was acknowledged that the reception the Association invariably received was always good, but on the present occasion it had been exceptionally good. Thanks were also returned to the Association on the part of the town for the grant made by them towards the carrying out of further excavations in the Roman baths. The proceedings of the Congress have proved highly satisfactory to those who took part in them, and Sir W. THOMSON, in summing up the results, said that this year's gathering would bear comparison with any previous meeting for the high scientific character of the work attained. He characterised the meeting as an epoch-making one in the history of electrical science, and placed special importance on the discussion in reference to lightning-conductors. The meeting of the Association will next year be held in Newcastle-on-Tyne, and in Leeds the following year. The invitation to meet in Edinburgh in 1891 is likely to be contested by the people of Cardiff, who are anxious to secure their presence for the meeting of 1890.

A COURSE of twelve lectures for the instruction of sanitary inspectors, beginning on the 25th inst., is to be given at the Parkes Museum on each Tuesday and Friday of the week. A nominal fee of five shillings, to cover necessary expenses, is all that is charged to students who desire to attend the course. The subjects to be dealt with will include the "General History, Principles, and Methods of Hygiene," "Drainage and Construction," "Water Supply, Drinking Water, Pollution of Water," "Ventilation, Measurement of Cubic Space, &c.," "Sanitary Appliances," "Sanitary Law—General Enactments, Public Health Act 1875, Model By-laws," "Sanitary Laws and Regulations Governing the Metropolis."

VERY few people out of Tournai have heard of ADOLPHE LERAY. He was a poet of the people, who was not afraid to write on behalf of the humblest classes. His songs are still the favourites in public and private reunions of the Tournaisiens, and above all others are recognised as "household words." Yet the poet was so modest he never sought any other means of publicity than the handing of a draft of a song to a friend. Copies were made by hand, and soon were known. He had no ambition to see his name on the title-page of a book, and as the race of modern poets are the vainest of men, LERAY'S modesty would by itself entitle him to the esteem of posterity. A friend of the poet collected several songs and published them in a volume, which is a great favourite in most parts of Belgium. At first it was contemplated to erect no more elaborate memorial of the poet than a tombstone, but as the people of Tournai insisted on having a share in the work, sufficient money was obtained to pay for a fine fountain, of which a bust of the poet forms a part, in the Place du Becquerelle, where LERAY was brought up. M. HUGO was the sculptor, and the memorial was unveiled on Sunday.

AMONGST the numerous suggestions that are constantly being brought to light, it is seldom that any scheme is propounded the novelty of which has not been anticipated. Among the subjects brought forward during the last day of the séances of the British Association was one by Colonel HAZARD advocating underground railway communication in great cities by means of a subway system. According to his ideas, the main thoroughfares of traffic should be reconstructed. Between the lines of kerb the substance of the street should be removed to a standard depth of 12 feet,

and the excavation so made replaced by four centrally placed subways, the two interior ones being devoted to rapid transit or fast railway trains, moved at great speed between few stations. These railways should be operated by electric-motors, and solid trains specially devised for the service and embodying provisions for safety and comfort. On either side of these centrally disposed railway subways are placed continuous galleries calculated for the housing, inspection, replacement, and repair of all pipes and wires of communication, sewers for local service, water-mains and supplies, gas-mains and service-pipes, steam service-pipes, pneumatic power, post, parcel, refrigerating, and time tubes, electric wires for arc and incandescent lights for street and private use, for power, signals, telegraphs, telephones, &c., and all other essentials or conveniences which are more profitably generated or produced at some central station. Many reasons are against the carrying such a scheme into practice, and many which would interfere constructionally with towns and cities as existing. Besides, companies object to laying their pipes in subways. THEODORE HOOK ordered of an undertaker the grandest funeral he could furnish, but left the undertaker, much to his disgust, to supply the main thing—the body to be buried. Before such a scheme has a chance the city will have to be found, or perhaps new towns like the proposed city of Hygeia planned and built for the purpose.

A COMPETITION is opened in the city of Cracow for the erection of a theatre, which is to be erected at the expense of the municipality. The designs are to be sent in on or before March 1 in next year. For the first design 2,500 florins will be awarded, 1,500 florins for the second, and 1,000 florins for the third.

AN outbreak of fire occurred on Wednesday night which threatened the destruction of the Olympic Theatre, and which was discovered about half an hour after the building had been vacated by the playgoers. The fireman "smelt fire," and, on proceeding to the dressing-room, he discovered that a fire was raging in the adjoining premises. He endeavoured to prevent the flames from attacking the theatre, with a hand pump, which he directed from the office window. Finding that the flames were too strong he laid on the main hose, and with assistance the danger was averted; but the premises were gutted, and the stage and scenery of the Olympic was much damaged by water and removal. Here is a warning that no time should be lost in rendering properties as well as structures of theatres fire-proof.

PREPARATIONS are being made for placing the statue of COLIGNY, the Huguenot, in Paris. The site adopted is behind the Oratoire—a church which is now appropriated to the Calvinists. The transformation of the narrow streets in order to form the Rue di Rivoli has caused the back of that church to be towards the great thoroughfare, the entrance being in an extension of the Rue Saint Honoré. The new statue will do something to lighten a spot which is rather sombre, and as the massacre of Saint Bartholomew was most ruthlessly carried out in the neighbourhood, the site is fitting. M. CRAUK'S statue is admirably posed, and the expression of the figure corresponds with the contemporary accounts of the gentleness of the Admiral. The costume of the time was graceful, and is finely treated by the sculptor. But when the statue is fixed the existing iron railings, it is hoped, will be removed.

ON the part of the Society for the Protection of Ancient Buildings, the secretary, Mr. TURNER, has addressed a letter to the *Leeds Mercury*, thanking the conductors of that paper for the suggestion that the Mayor and Corporation should acquire Kirkstall Abbey for the town. The Society, he says, will gladly assist in promoting the object in view in any way within its power, and begs that the matter will not be allowed to drop. If the promised assistance is not attended by better results than hitherto little will be gained, for the secretary says:—"My committee did its utmost at the beginning of the year 1883 to interest some influential gentlemen, and to try and promote some scheme for the preservation of this most valuable building, but without success."

### THE TRIENNIAL EXHIBITION AT ANTWERP.

THERE are many amateurs holding high offices on the continent who assert that art cannot prosper under the system of annual exhibitions. Painters, it is said, are compelled to scamp their work, as otherwise they might lose the opportunity of appearing before the public, whilst the latter, owing to the frequency of the exhibitions, rarely give adequate attention to what is to be seen. Through the influence of such views the French artists were threatened with eviction from the Palais d'Industrie, in Paris. The Administration of Fine Arts held that triennial exhibitions were more advantageous for the public, and the annual exhibitions of the Salon must have been suspended if some of the Ministers had not exerted themselves in behalf of the artists. Officialdom suffered a defeat which will not be readily forgiven, and sooner or later the attempt may be repeated and the French public deprived of one of the fascinations of the summer.

Any one who is inclined to believe that it would be wise to have a longer interval than a year between the exhibitions of pictures would do well to watch the effect of triennial exhibitions in Belgium. In that country there is some necessity for them, but we cannot say that much advantage is derived from them by artists or the people.

Brussels being the capital, as well as a resort or second-rate Paris for people from all countries, it might be believed that the artists of Belgium would, for their own interests, be glad to contribute to the exhibitions of that city. The provincial spirit is however very strong in the country, and it is in favour of local exhibitions. Some of the best work in painting is produced in Antwerp and Ghent, and hardly a school exists without claiming pre-eminence. A policy of recognition of local talent was adopted by the State. Ghent and Antwerp were placed on the same footing as Brussels, and the capital must dispense with an exhibition until its turn arrives.

Looking at the results, it may be said that with exhibitions as with many other things, the appetite grows with what it feeds on. If we are to judge by the number of visitors that are to be seen in the galleries during one of these triennial exhibitions, it would seem as if the deprivation of an exhibition from a town did not whet the enthusiasm of the Belgians. Last year the Exhibition in Brussels was empty on week-days; only on a Sunday morning, when a penny was the price of admission, could a crowd be found in the galleries. At the close of the season the expenses were far in excess of the receipts. In Antwerp there seems to be still more indifference. Returns are not given of the people who pay for entrance, but at times we have observed that the attendants in livery outnumbered the visitors. If the Exhibition could be said to be made up of works without value, so much neglect would be pardonable. It is, however, not only an excellent Exhibition, from containing many works by native artists who are still working, but it has, too, a foreign department, and a student is therefore enabled to compare the style of the Belgians with the styles that are in vogue in France, Holland, Germany, Austria, Hungary, Italy, and Switzerland. Besides, there are special collections of works of the late NICAISE DE KEYSER and LOUIS GALLAIT, two of the great men of Belgium who died last year.

One excuse may be offered for the absence of the public, namely, that the Exhibition is held in an out-of-the-way place. The Antwerpians do not care to sacrifice time which can be utilised for business, and a journey to the Palais de l'Industrie means going to the very end of the city. The building containing the pictures stands in a garden which is used for concerts, fireworks, &c., and is not unsuitable for an exhibition of works of art, but the inaccessibility of the place will not be condoned.

The great hall is assigned to sculpture, designs, engravings, &c. A bust of Lord SALISBURY, by Mr. BRUCE JOY, is, from its fidelity, quickly recognised among the crowd of similar works. The power attained by Germany on the continent is seen in the number of statues and busts of the rulers of that empire. How long Belgium may be permitted to exist as an independent kingdom is one of the problems of politics; but at present the wisest course is supposed to consist in showing that the French aversion to

Germany has not infected the Belgians. Hence the variety of busts of the three emperors, and the habiliments of woe which shroud those of WILLIAM I. and FREDERICK III. The correspondents of French journals have sneered at the efforts which are made for preserving a friendly feeling between Belgium and Germany, but it may be supposed that the Belgians are the best judges of their own interests. If the exhibition of German pictures can be of any use in staving off the *dies ira*, it could hardly go further than in Antwerp.

The great change in style is exemplified by a comparison between the works of DE KEYSER and GALLAIT and those by modern artists. The late head of the Antwerp Academy seemed to recognise the tendency of our time, and he went more and more towards realism. DE KEYSER is represented by works of many kinds, but the picture of a Spanish procession in Holy Week is his masterpiece. It is true to place and time, but what is most remarkable is the skill shown in characterisation; priests, beggars, grandees, all bear the mark of the South, and it is easy to recognise by his mien that the bearer of the cross, although clad from head to foot in the black garments of the Misericordia, is a gentleman. Even on Good Friday it is not to be expected that Spanish fervour would be entirely of the sombre cast, and the excitement of some faces suggests that the ceremony bears some relationship to pastime. A finished sketch is also shown of the picture devoted to Flemish artists which is found on the walls of the Antwerp Museum. It was painted in rivalry to DELAROCHE's famous *Hemicycle*, and will stand a comparison with that work. The subject was a favourite one with the artist, and we understand that he painted no less than six variations of it.

The principal work by GALLAIT which is seen at Antwerp is the well-known one showing the funeral chamber of Counts EGMONT and HORN, who are represented lying together, with their heads once more placed on their bodies. The Spanish governor is present, and the scene is one which allows of the display of various emotions. It is painted with much care, but with less finish probably greater effect might be gained. The artist's *Art and Liberty*—a Bohemian fiddler—was on its production at once made popular by the means of lithography. It seems to be a study in monochrome rather than a picture. It is to be regretted that when a Salle Gallait was proposed, more was not done towards securing the masterpieces of the artist. The *Temptation of St. Anthony* surpasses any of the works seen at Antwerp, and we could name others which are sufficient to create a reputation.

Last year the Antwerp artists grumbled over their treatment in Brussels, and as some artists in the capital expected reprisals, they did not venture to send works to Antwerp. Among the pictures from Brussels, the first place must be assigned to M. JULIAAN DE VRIENDT's *Daughter of Jairus*, a large work which is based upon customs which still exist in the East. The moment selected is when CHRIST entered the house. Our LORD is clad in white. The countenance is of an ideal kind. It will perhaps be compared with ARY SCHEFFER's picture; but there is more tenderness, more dignity, and a more quiet power about the Belgian artist's creation. PETER, who stands near, is not the old man with the bald head that so often appears in Italian scripture pieces. In the picture he is shown to be a vigorous enthusiast, whose aquiline nose and dark hair denote a Hebrew of the Hebrews. The daughter of JAIRUS lies upon a mat placed on the ground. She is clad in white, and near her is her mother, who is supposed to have cast herself upon the ground. Around are the hired minstrels and mourners. The whole work has a feeling about it which is rarely to be found in modern scripture pieces. The colour is exquisite, and M. DE VRIENDT has proved he possesses an insight into the spirit of scripture which we hope may be often exercised. M. ALBRECHT DE VRIENDT, who has watched the progress of his brother's picture with anxiety, has only two pictures in Antwerp—*The Old Age of Vondel* and *The Anniversary*—which are marked by the qualities that become the head of the Brussels school.

The Antwerp school is, of course, amply represented. The president of the Academy, M. CHARLES VERLAT, has seven works, the largest being an immense picture of a lion, lioness and cubs. The owners of his works have

enabled strangers to judge of his skill in figure, landscape and animal painting. It is unfortunate that the fine historical painting for the town-hall, which has engaged so many of M. VERLAT's days, is not in the Exhibition. M. VAN DER OUDERAA has a reduction of his picture, *The Repression of Perjury*. The larger work is to have a place in the Assize Courts of Antwerp, which will be adorned with several of his works. It appears that in 1569 a German soldier was executed in Antwerp for this worst of crimes, one which would strike the sword from the hand of justice and confound the innocent with the guilty. In those days there was an altar, surmounted by an immense crucifix, in one of the streets near the Steen or prison on the quays. It was for the condemned. The man kneels at the altar with a monk, and on both sides are seen the figures of mounted and unmounted officers of justice, and other persons who await the rising of the prisoner. He is clad in a uniform that once was red, and the colour offers a contrast with the brilliant crimson of the Mephistophelian fellow who serves as executioner. There are some more of the painter's illustrations of the penal history of Belgium.

The pictures of English battle scenes, by M. SCHAEFELS, are known everywhere through the glaring lithographs. In the Exhibition is another work of the class—*Siège de Flessingue*—when the English vessels overcame those sent by the Dutch, who were then ruled by the foolish LOUIS BONAPARTE. In this work the artist shows skill as a marine painter. The combatants are mighty ships of the old type, and happily there is no chance for introducing men who are bleeding to death, the kind of figures in which M. SCHAEFELS takes most pleasure.

M. EDMOND VAN HOVE, of Bruges, has one of his remarkable representations of Mediæval countenances, which everyone somehow feels to be authentic. This time it is a triptique, suggesting alchemy, sorcery, and scholasticism. It is not fair treatment of the old chemists and mystics to place them as if they were related to the physicians, who believed they could put their fingers on the devil, which was supposed to inspire the women who were accepted as sorcerers. The seekers after gold and the highest good were guided by a rigid logic, whilst the doctors of medicine cared little for it—indeed, as many of us know to our cost, the art of reasoning is not always in our time considered to be a necessity with the men who are authorised to heal us. In the central compartment of the picture a young woman, who is nude, is seen lying upon a table. A doctor, with a scalpel in his hand, is about to make an incision in her body. The worthy who presides has, however, a theory of his own, and the operator is therefore obliged to leave his work to convince his superior. The two men would serve for DOGBERRY and VERGES, and never was the pomposity and arrogance which come of ignorance better exemplified. An officer who has carried the girl looks back on her with as much indifference as if he were an hospital porter, whilst the young registrar enjoys the scene and forgets to report the discussion. The victim has a dazed look, as if she hardly realised her condition. M. VAN HOVE has found so much pleasure in ugliness that few critics could suppose he was capable to paint the nude with the power seen in this picture. Near it is one of M. ANTHONY's pictures which recalls the old illuminator's work. The subject is the legendary marriage of St. CATHERINE, but we have seen other works by the painter which deserved to be preferred for richness of colour and beauty.

(To be continued.)

#### LORD GRIMTHORPE ON RESTORATION.

THE following is extracted from a letter written from St. Albans by Lord Grimthorpe to the *Times*, apropos of the Society of Antiquaries' instructions on restoration. In his letter, after giving his concurrence to all that was said against the action taken at Cossey Church, if the account of the treatment of the church is not exaggerated, he writes:—

The more one studies their instructions on "what would appear to them to be the duty of the guardians of churches," the less of any accurate or practical information one finds in them, and the more vague, abstract, and absurd is their philo-

sophy. What are we to make of their fundamental proposition that "every one of our ancient parish churches contains in its fabric the epitome of the history of the parish, frequently extending over many centuries?" This no doubt seemed to its composer and adopters a piece of very fine writing. I should like to lock him up in any ancient church of his own choosing, with meat and drink and a candle against ghosts, until he had composed an epitome of the parish history there. That is the proper kind of test for that kind of hazy rodomontade. He neither knew nor thought what he meant, except to write something that would read well as a maxim, to carry whatever he liked to build on it. And thereon they do build this further dictum—that "it would appear to them to be our duty not to 'restore,' but to preserve a church . . . and to preserve, so far as practicable, the record of what has been its state during all the period of its history." Even if that were of any consequence, compared with its use and beauty, I should like to know how the state of a building during all the period of its history, in which it is assumed to have suffered a variety of changes, and generally has, is to be recorded by crystallising the last of them until it vanishes into ruin.

Apart from the folly of such pretences of practical advice, the accidental adoption of these principles by too many people on other grounds has caused the ruin of many of the finest towers and of some whole churches, and would have ruined many more. The vicar of St. John's, Chester, after that once beautiful tower fell, published the advice he had received from the Society for the Ruination of Ancient Buildings, as I always call it, on no account to attempt its restoration, but to shore it up, or build brick walls, or anything that could not possibly pass for restoration. So it fell. So did the grand steeple of Chichester while they were trying, too late, to save it, and the tower here was just saved while it was actually sinking by the late Mr. Chapple, to whom Scott left it entirely; and so was the central tower of Hereford when Professor Willis warned them what was going to happen, and the west one did fall and part of the nave with it. Nothing is more certain, now that we have had to do it, than that this cathedral was going to fall very soon in half a dozen places, after all the 40,000*l.* that Scott had spent in shamefully careless restoration on antiquarian principles, and that it would have been a heap of stones by this time if Mr. Evans and his confederates had got their way nine years ago, and if it had not been restored in the sense of rebuilding nearly the whole of its chief fronts and windows, and some of the pillars, and a great deal of the walls, and redoing some of Scott's bad work just now. Nobody but a set of ignorant pretenders would write as these anti-restorationists always do about the possibility of keeping up old buildings by shoring and cementing and such like temporary makeshifts. The commonest mason here knows better.

They are prudent enough to say for the public what they evidently do not mean—that they "do not overlook the necessity of adapting the buildings to the wants of the present day," for they proceed after a few lines to contradict it by saying that "the ancient record" (a favourite cant word of theirs for "work") "should not be wiped out to make room for the new." Then how is the new to be got in? "Nor falsified by making the new a servile imitation of the old." But that is the very thing they have always been crying out at my not doing here, since they could not deny any longer that rebuilding was absolutely necessary. So long as we employed architects, they too were always insisting on copying old work which every competent mason could see had always been cracking and bursting because it was designed in as great ignorance of mechanics as most architects display now. The real truth is, what I have written often before, that these noisy antiquarians hate good restoration, because it does resemble old work so much as to puzzle them and get them laughed at, and they frighten weak architects out of their senses, as they latterly had Scott especially, though he hated them and at one time knew better than to mind them. And people in general have got afraid of restoration because it seldom does resemble old work. No doubt it is provoking to an antiquary to harangue a peripatetic party, or the world, on the ancient beauties and modern ugliness of a building, and then to be told by somebody who has seen it all done that you have been praising and blaming just the wrong things, as has several times happened here, and I dare say elsewhere, though very few restorations are done well enough for that.

Then they display their knowledge by telling us that "uniformity of style was very rarely a characteristic of our old churches, and therefore that a part of the building or a piece of furniture is to be judged, not by its conformity to this or that style, but by its fitness for its place and for the work it has to do." In other words, because the five Gothic styles mix freely without uniformity, therefore any bad sham Italian, and every bit of painted deal Georgian churchwarden carpentry, and the flat brick walls which cut off the porches and closed the ends of these aisles, and the rubbishy bit of Queen Annery which Buckler, the architect and antiquary, called "the massive Gothic arch" of the central porch, being all "fit for the work

they had to do" were sacred records, and those who substitute better things and more like the original for them, are sacred in another sense or language.

From architecture Messrs. John Evans and Co. rise into theology. The fact is that these people have altogether mistaken their business position, and floundered more hopelessly out of their depth than ever. The late Mr. Fergusson, who knew more of the architecture of the world than any man who ever lived, or probably will live, in the last paper that he published, I think, said that few people can now regret that we defied all the antiquarian and other clamour here (which was primarily raised by Mr. Evans), though he added that nobody but Sir Edmund Beckett would have faced it. He had long before warned mankind against the mistake and absurdity of confounding architecture with antiquarianism. Indeed, they go on opposite lines. Architecture is decorative and good building. Antiquarians care nothing about that, and say so when they are as honest as Mr. Evans's predecessor, Lord Carnarvon, who, when he wrote to scold us for resolving to restore the old proportions of this cathedral, confessed that it was ugly as it was, but it was "interesting." I replied that he might cultivate as much interesting ugliness as he pleased at home, or at his own expense, but we declined to do it for him. They had better also imitate the candour of a very different ally, Mr. F. Harrison, who, naturally enough, from his well-known opinions of what goes on in churches, wrote in some magazine last year that those who want better arrangements or to get rid of existing things that they do not like in churches should build new ones—a process which may manifestly go on for ever as they successively decay into "interesting ruins."

I am not going to expatiate on principles of restoration. You know, and have said, that I abhor principles. No good or great thing was ever done by them, but all by the genius of common sense, with the requisite special knowledge. I will not even write now the reasons why restorations are generally done so ill. But bad as they mostly are, if all our churches could be suddenly restored by the wish of the antiquaries to their ante-restoration state, ninety-nine out of every hundred church people would vote for suppressing them, if not for hanging every man who called himself an antiquary or an archaeologist, or any other of their designations.

### THE BRITISH ARCHÆOLOGICAL ASSOCIATION.

(Concluded from last week.)

ON Thursday the members were received by the Marquis of Bute at the Island of Bute.

#### *Rothesay Castle.*

This castle was visited first, and Rev. J. K. Hewison, in describing it said that the peculiarity of the castle consisted in its being almost a perfect circle. It had walls 20 feet high and 8 feet thick, flanked at the four corners—the north-east, the south-west, and the other two diagonal corners—by great towers 33 feet in diameter. The interior was the older portion. It was supposed to have taken the place of an older fort, and that this was the reason why the circle was not absolutely perfect. The circle was from 135 feet to 138 feet in diameter, and the doorway faced almost due north. In the castle the lower part of the wall was supposed to be the most ancient—work certainly anterior to the thirteenth century. The first notices they had of the castle were in the Norse records, in which it was stated that the men from the north sapped the walls, which were soft, and killed the Stewart upon them. From examination of the walls they would see that they were of two kinds of masonry. The one below was apparently the same kind as they would see at St. Blane Church later in the day. It seemed to have terminated in regular battlements, because outside they would see the places where the spouts had been. The barbican had been projected from the circular walls early in the thirteenth century, and the great barbican had been constructed in 1540. The old wall had been paved on the top, and when the castle was rebuilt early in the fourteenth century a different kind of masonry was placed on the top, while a passage was left in the heart of the wall as usual in the thirteenth century. There was no keep, but the walls were defended from the towers, and that they also had a separate means of defence was borne out by the fact of the remains of stairs to the curtain walls. Of those stairs there were four, and one, the most perfect, was called "the bloody stair," either from some desperate encounter which had taken place upon it, or from the ruddy hue of the stone of which it was composed. The towers apparently had doors inside connected with the side walls by means of wooden gangways, used in times of peace and taken away in times of war. Old records showed that Allan the Stewart in 1204 gave Kingarth to Paisley Abbey, and he probably built the church of St. Blane and this part of the

castle. The great bartisan was only added in the time of James V., and the coat-of-arms over the doorway had the two unicorns, first used by James IV. The portion of the barbican near the entrance became the royal palace in the end of the fifteenth or beginning of the sixteenth century, and it was divided into regular apartments three storeys high. In 1228 and 1263 the castle was taken by the Norsemen, and in 1312 it was destroyed, while in 1334 it was rebuilt. In 1541 Sir James Hamilton was employed to renovate the castle, but he embezzled the money and was tried for the crime. The little chapel in the castle was dedicated to St. Michael, was in two storeys like the Ste.-Chapelle in Paris, and was supposed to date from the thirteenth century. In the fifteenth century they found records of a court for the payment of the chaplains of that ancient place. The passage contained an old dungeon in which Patrick Lindsay was confined by James IV. for the action he took in defending his brother, David Lindsay. Speaking of the drawbridge, he stated that it stood on the original oak piles which had been found burned down to the water edge. The castle was first explored in 1816, but nothing of any consequence was discovered. It was again re-examined in 1871-2, and traces of all the buildings inside the walls were laid bare, and they could see that there were a great many of them, but still no relics of any importance were found. In one part of it ashes were discovered, which had evidently come from a smithy, showing that forgework had gone on within the castle walls.

Mr. E. P. L. Brock said it was perhaps the oldest castle remaining in the country. From its masonry they could trace that it was even older than Bothwell Castle. In it they had many signs of the gradation of one class of early work into another. The circular form of the court would recall the castles of Listowel, Launceston, and Tremmerton, in Cornwall, which all showed peculiar local feeling. In the middle of the twelfth century, which was the date of the oldest portion of Rothesay Castle remaining, they had a form very similar to that of the three castles referred to, and he took it that it was also a local form. The form, in his opinion, was owing to a local peculiarity on the part of the builders who had the work on hand. As far as the masonry was concerned, they had on the inner face of the wall what they would call semi-Norman work or earlier in England; but everything was later in Scotland, and he would fix the date at about the middle of the twelfth century. The chapel was of the usual form, and that an early one. The staircase was external, and the traceries of the windows were very similar to those to be seen in the nave of Glasgow Cathedral, and also in the ruined chancel of Rothesay parish church. The party then visited the parish church.

#### *The Parish Church.*

Rev. Mr. Hewison said they stood on the site of the original Cathedral of the Isles. The ancient parish church was dedicated to two saints. It was called the Church of Kilbrook, or Brook; and the little chapel outside was named the Church of Mary—the Lady Kirk or Kilmory. The old church was taken down first of all in 1692, and having been rebuilt stood until 1796, when it was again removed, and the present structure put upon its site. It was supposed that the chapel was the chancel of the church; some persons called it the choir, but he was not sure about either of these conjectures. It measured 27 feet 7 inches long by 17 feet 8 inches wide, and it could easily be seen from the style of architecture that it dated from the thirteenth century. At that time the Stewarts of Scotland were apparently all-powerful in this place. It was most notable now for containing three beautiful effigies which lay there, he might say, in disgraceful disfigurement. Great controversies had been waged round those. The Marquis of Bute told them that Robert II., in view of certain contingencies, erected tombs up and down the country, and that this was supposed to be one of them. The tomb he referred to was the one on the south side of the chancel, where they saw the effigy of a warrior lying cap-à-pie. There were four theories in regard to the monument. The first was that it was the tomb of Robert II., the second was that it was the tomb of Robert III., and the third that it was the tomb of Sir John Stewart, of Bonkill, who was slain at Falkirk in 1298, while in the fourth place it had been asserted, and he must say almost conclusively proved, that it was the tomb of the eighth Hereditary Grand High Steward of Scotland, Walter, who married Marjory, daughter of King Robert Bruce. The second effigy was believed to be that of Marjory, who was shown dying with a child in her arms. It was stated that the third was that of Angus, Lord of the Isles, who died in 1210, but an inspection of some Gothic lettering on the stone led him to believe it was that of one of the Cummings intimately associated with the island.

Mr. John Honeyman said the architecture of the chapel proved that it had been erected towards the close of the thirteenth century—probably rather later than the chapel within the castle—and this circumstance was strong confirmation of the suggestion mentioned by Mr. Hewison that the tomb he had

described was that of Walter Stewart, as much before his period the chapel did not probably exist. It would be noticed that the building had been considerably altered, as the square windows were not a part of the original building, and the canopied recesses of the tombs were also of later date than the walls in which they were placed.

Mr. Brock expressed regret that such monuments as those in the chancel should be allowed to remain year after year uncovered and unprotected.

At Mount Stuart the party were entertained at luncheon, and the castle was thrown open for their inspection. After leaving, the chapel of St. Blane was visited. The structure was described by Rev. Mr. Hewison. It was Romanesque in form, and consisted of a nave and chancel. From examination of the ruins he had come to the conclusion that they were constructed on an earlier foundation.

#### *Paisley Abbey.*

Paisley was selected for Friday's excursion. The abbey, which was examined, was described by Mr. Loftus Brock. The name of the patron saint, St. Murren, he said, was that of one of those old Celtic saints whose original home appeared to have been Ireland. There was a tradition that an old church dedicated to St. Murren, most probably built by him, occupied the site at very early times. They would see fragments of very early masonry along the south side of the nave and the west side of the chapter-house, including the west front of the curious chapel of St. Murren. This showed that the chapel of St. Murren must have existed from the times of the earliest masonry now to be found in Paisley. The abbey was founded by Walter Fitzallan in 1163, and was colonised by Cluniac monks from Wenlock in Shropshire. It was burned by Edward I. during the wars of succession in 1307. In dealing with the architectural details of the building he pointed to the beautiful western doorway, which was of good First Pointed work. That the building was the work of Scotchmen he had not the shadow of a doubt. That it was different from English work they could all see, although it resembled English work much more than some of the other Scottish work of the First Pointed style which existed in Scotland. They had this interesting evidence regarding the older church, namely, that it was of the same width as the present building, and that its nave also was of the same length, whatever the transepts and chancel may have been. They had evidence, also, that it was intended to erect a tower or spire at each side of the west entrance, and the bases of those towers were before them. They had evidence that while there was an old design partly carried out at about 1170, there was an addition to it about thirty years later. They should see how that design had been altered again and again. Whether the two western towers were ever completed was open to very great doubt. He ventured to think that the whole design was that of Abbot Tarver. From the evidences of masons' marks, he concluded that the pillars were of later date than the wall beside them. The occurrence of semicircular arches was no criterion of date in Scotland; they would find them in the earliest works which Scotland had produced, and in the latest. He compared the masons' marks found in the different parts of the building, and drew the conclusion that one body of workmen executed one mass of work and another another. He called attention to the curious way in which the builders of the arches incorporated their work in the older and thicker work of the towers at the west end. The structural evidence was conclusive that the church never had—he meant when these pillars were erected—a stone-vaulted roof, and that it was always intended for a light ceiling, the clerestory being too light to support a heavy roof. In like manner the central tower could never have been a very strong or tall one. As to the choir they would notice its extreme length, and, from the fact that the wall was perfect on both sides, with only one small doorway on the southern side, it was evident that there were never aisles to the choir. From the appearance of the beautiful sedilium, and from the mouldings all being of a later look than those of the nave, he concluded that this was the work of Abbot Schaw, who was known to have erected a great number of buildings there towards the end of the fifteenth century. The work was delicate and graceful, and much of the masonry was in good order. It was there that a great number of the masons' marks were to be found different from those in the nave. He concluded, therefore, from the evidence of the architecture and of those marks that they were within a later building than the nave. The plan of the church—an extended parallelogram—was not so unusual as many might be led to believe. Looking back towards the nave, they would notice the bases of the two piers which supported the central tower. The piers were of interest, because they gave them by their capitals which remained the height of the springing of the arches which supported the tower. On looking at the south-east pier, they would notice that when the tower fell there must have been a tremendous strain naturally upon the masonry. The upper part was pushed out below the lower, which was its original position, six or seven inches. On the two western ex-

tremities of the choir where the other piers stood, they disappeared altogether at the fall; it was then that the masonry was rebuilt. They would see how very narrow were the arches which led from the two aisles of the nave into the transepts. They had nothing at all like that in England. The outline of the arches was clearly Pointed, but the date was that of Abbot Tarver. The north transept remained in good condition, and was extensive. It was of moderate height in comparison to the nave. It might be reasonably asked how it came that the transept was so low and the nave so high, and did the chancel follow the height of the nave or the transepts? He concluded that it followed the height of the transepts. His reasons for that opinion were twofold—first, that the walls were not strong enough for any very great height, existing, as they did, without buttresses; and, secondly, that without buttresses it would have been impossible to have carried the vaulted roof of stone over them.

Mr. Ewan Christian called attention to a very remarkable stone, which evidently showed the action of fire, and also the particular tooling of the thirteenth-century work.

The party then proceeded into the cloister gardens, and thence into the St. Murren Chapel, and subsequently visited the museum in the town.

At the afternoon visits were paid to the Hunterian Museum, Glasgow, and to the Exhibition.

At the evening meeting in the Corporation Galleries the Marquis of Bute read a paper on the arrangements of the interior of Glasgow Cathedral in reference to certain foreign examples.

#### *Masons' Marks.*

Professor Hayter Lewis, F.S.A., read a paper on the subject of masons' marks. He said that Scotland possessed a larger number of such marks than could be shown down south. They were found cut on the stonework of nearly every Mediæval building of importance, and on very many buildings of greater antiquity such marks were now used as much as they ever were, but they were hidden. Proceeding, he said that the first point was to ascertain whether they were hereditary, descending from father to son, with such slight alterations as might serve to distinguish them from each other. Certainly in many cases it was not so. On the other hand, there were cases in which the same marks were used at the present day by members of distinctly the same family, there being some slight differences for the sake of identification. The next point was, Was there any distinct mark which would serve to distinguish the members of any particular lodge or company? and he might say shortly that he could see no sign which would thus define a separate group of workmen—such a sign, for example, as that of the crown above the hammer, so well known on Scottish tombstones. Yet there were certain cases in which one would expect to find them if, as was generally supposed, the companies were under clerical guidance. The only method left by which one could trace the work, and the progress of any particular lodge or fraternity from one building to another, or from one date to another, so as to ascertain the progress of an art by the consecutive history of two or more buildings, was by taking a group of separate but well ascertained marks in one of them and tracing out the same marks, if possible, in another. All evidence seemed to point to there having been bands of skilled workmen attached to great monasteries, cathedrals, and in later times large cities, whose example and training influenced the districts around. When works of great magnitude were in hand, these bands were, no doubt, increased; and when the works ceased they were lessened in number, the members dispersing here and there and leaving their marks in various places, much as masons now did at the finish of some great work. But he found no distinct trace of the general employment of large migratory bands of masons going from place to place as a guild or brotherhood. As to whether they could find any distinct change between the marks of the twelfth and thirteenth centuries, when the great change took place in the tooling and the style generally, he felt bound to say that he could not see any distinct or general sign of change. Generally it was found that the same forms which were used in early times were continued in the later, though they were then made more ornate. Putting together the information which they had, they found that certain definite methods of marking the general surface of the stones characterised the masonry of the style which was called Norman; that in the thirteenth century there was introduced with the Early Pointed style an entirely different method of finishing the surface, and that the source of this method was apparently from the East; that masons' marks did not appear to have been commonly used in Europe until late in the twelfth century, and that some of the most prominent of those marks appeared to have been used continuously from very early times in eastern countries.

Dr. Phené, F.S.A., corresponding member of the Academy of Sciences at New York, read a paper on "Further Discoveries of Mounds in the Forms of Animals in America, China, Scandinavia, Greece, Asia Minor, India, France, Spain, Scotland, Ireland, Wales, and England." It was pointed out

how little this curious and interesting subject was known' although high-class works recorded these mounds by many hundred examples. The author had devoted thirty years to the subject, and in so doing had travelled extensively, all the continents being visited, and the mounds, with their respective traditions, the local customs in their vicinities, and the relics found, being carefully noted by him. The similarity of customs and traditions generally led him where to search, and such searches had been most successful.

Following this paper, Dr. Phené delivered a second address on the similarity of objects found in the mounds, and traditions and customs still existing in the localities of these animal forms. Such forms generally contain, or are near, natural caves or megalithic chambers, and this in every part of the world, from the great caves of the Hindoo gods to Weyland Smith's cave near the White Horse in Berkshire, or the cave temple under the Sphinx. The great American serpent in Ohio overlooks the plains of Kentucky, where the Mammoth Cave is.

Saturday was devoted by the members of the Society to an examination of the Roman camp at Ardoch, Doune Castle, and Dunblane Cathedral.

On Monday an examination was made of the antiquities of Falkirk and district and in Linlithgow. At the evening meeting several papers were read:—"Early Christian Inscribed Monuments in Scotland," by Mr. J. Romilly Allen; "Scottish Architecture" (this was given in *The Architect* last week), by Mr. Loftus Brock; and an historical paper by Mr. G. R. Wright.

Dunfermline was visited on Tuesday, and objects of antiquarian interest inspected. The closing meeting took place in the evening in the Corporation Art Galleries, Archbishop Eyre, and subsequently the president, the Marquis of Bute, presiding. Various papers were read, and the Congress terminated with the hearty acknowledgments of the members for the kindness they had experienced in the course of their visit.

### THE ROMAN BATHS.

A VISIT was paid on Monday afternoon by the members of the British Association, who have this year held their annual congress in Bath, to the Roman Baths, Major Davis, F.S.A., the city surveyor, conducting the party.

In describing the work, Major Davis remarked that at least 1,300 years had elapsed since so large an audience had favoured that rectangular bath with their presence, and especially the members of the British Association, which he did not think ever was represented in Roman times. In coming to Bath most people were struck with the fact that it was absolutely a modern city; there was nothing to remind them of its antiquity except possibly the abbey; but beneath the soil of the ground they had evidences of excessive antiquity, and it had been his privilege to unearth those antiquities, the largest and grandest portion of which was where they were then assembled. He would not trouble them with the history of the Roman antiquities in Bath, because those had been so well dealt with in a little book, to which he had had the honour of contributing, and with a copy of which they had all been presented, but he might remind them that the history of that city certainly dated from the year 48, the days of the Emperor Claudius. There was no doubt that there was a city there in 48, and in 80 Solinus, writing of Bath, spoke of the magnificent baths and its temple of Minerva, and he mentioned among other remarkable facts that the temple of Minerva was maintained with a perpetual fire. Geologists would say, of course, that the perpetual fire proved at once that the Romans used coal. Well, he regretted to say that among the ashes he had found there he had not found any coal ashes: all of them proved to be wood ashes.

Although they had a history of the Roman antiquity of Bath, they had no evidence of the existence of baths there—they had the springs there and the springs were always flowing—until 1755. The only record they had of the existence of baths were the antiquities built into the walls of that ancient city. In 1755 the ancestors of the present Lord Manvers, whose property that was, removed the abbey house, which took the place of that where the prior lived previous to the Reformation, adjoining the abbey, and beyond the gallery which they saw. In that year a very large bath was discovered, but unfortunately almost the whole, he believed, of that discovery was removed. The east wall of the bath they were then in formed the west wall of the bath that was then found, and which ran from east to west. The whole or a great part were laid bare, and buildings were afterwards erected upon them, so he regretted to say he could not show them those discoveries. The Corporation of Bath had fortunately become possessed of that property, and he had no doubt that, on a recommendation from the British Association, the Corporation would at once clear the ground and show them the objects of 1775. In 1775 they touched

upon the east wall of that bath, and in pursuing the discovery they went so far west that they came upon the steps of that bath. The dimensions of the bath of 1775 led them very properly to surmise that there would be a large rectangular bath on the west of what they had discovered; but they were under an error in their surmise, and although they gave dimensions for it, and dotted the lines in plans, they had no conception of the great bath that they were able to show that day. Those who were unacquainted with that place would hardly know why he should be so in praise of the bath. Writers had said that the bath was discovered in 1755, but if it was discovered then why did not the Corporation purchase the property above it and clear it out? They did not do so, and there were seven houses standing above it until the present Corporation cleared it out. In 1755, after having proved the existence of the baths, additional buildings were required to be added to the pump-room, and in making those additions the entrance portico and columns were found, and were deposited at the Literary Institute. In 1788 the pronaos of the portico of the entrance to the baths was discovered, and later on one or two points were disclosed about the baths, but it was not until 1869 that a real discovery of any importance was made, and he had the honour of making it. It was a portion of the hypocaust about which much had been said and written.

He could not expect to make all in Bath antiquarians, and the discoveries were partially covered up, but in 1878 he found some steam vapour coming from a certain place. He thought he would investigate the matter—he meant the Mineral Baths Committee, for he was entirely the servant of the Baths Committee. He excavated one corner of the bath and came upon some lead of excessive thickness, and he found signs of a bath being there. But at that time the Corporation of Bath, although they possessed five-sixths of the springs, were unfortunately not possessed of the spring which belonged to the abbey house which was there. The spring really was the drain of that bath, and unless the Corporation became possessed of the spring it was impossible to pursue any excavations, because the ground they were standing on was saturated with hot water, and if they pumped it out the baths suffered for want of water. He laid the matter before the Corporation, but it took them seven years to consider about giving 600*l.* for the little spring, which was now worth 20,000*l.* The Corporation having become possessed of the spring enabled him by a grant of money to explore a Roman drain, which the priors of Bath constructed to draw the water into the abbey house. It was made of pure tin, and he was not aware of any others having been found this side of the Alps. The object of the Roman drain was a useful one. When cleared it enabled them to drain the baths at so low a level that there would be no possibility of any impurity contaminating the baths; and, as he knew the great value of these waters as curative waters, he was particularly anxious that there should be no suspicion of any impurity getting into the waters. In going along that drain, he found a passage of water from the bath along the whole length of which they went, and of the existence of which he was not then aware. He pursued it until he got to a beautiful archway of Roman work, but not before they had had to go through immense masses of masonry that had been thrown down with considerable violence. When they got to the King's bath, they came to a hatchway where there was a sort of receptacle, and in that receptacle, or catch pit, they found two vases, also of tin, and several other things, and a drinking-cup of particular interest. They also found other antiquities, now in the cases in the pump-room. After the catch pit, they went through solid stone walls 2 feet 6 inches thick, and came to the octagon, where was the hot well of the baths. It was 50 feet in length by about 40 feet in width. The wall was built of solid stone, and was cased with lead, the bottom being coated with lead. He cleared out the whole of the remains that were in the octagon. The springs, when he first excavated beneath the King's bath, yielded 116 gallons a minute. He then was fortunate enough to raise it nearly 50 gallons a minute, and recently by stopping a number of leaks which had been going on from time immemorial, and made this city as it was represented on the arms "the city of waters," they now had a yield of 300 gallons per minute. The public press took up the matter, and, the *Times* having inserted a letter of his, it brought an immense flood of letters to the place. Only one paper in the city among five backed him up, and that was the *Bath Herald*. The subject was brought before the Society of Antiquarians, and the Society came forward very liberally and voted 100*l.* towards the excavations, and that formed a nucleus about which a quantity of money was collected. Mr. Murch, who was the Mayor of Bath at the time of the Association's previous visit, and when he (the speaker) was the local secretary, obtained subscriptions and enabled them to pursue those investigations. The excavations were pursued, and they had worked out the whole of the bath as they then saw it. Major Davis afterwards described the discovery of a hypocaust, which he said had been written about more than any other hypocaust, and afterwards

referred to the erection of the new baths by the Corporation at a cost of 20,000*l*.

Sir John Lubbock expressed thanks to Major Davis and the Baths Committee for their reception of them on that occasion. Major Davis had said very modestly that he was the servant of the Baths Committee, and he was sure they were much indebted to them for all they had done. So remarkable a discovery was mainly due to the energy and ability of his friend Major Davis. He had been in correspondence with him for some time, and he had this qualification for speaking perhaps, that he knew a little more than most of them of the great difficulties with which he had had to contend. They all saw how successfully he had overcome them, and he had held out to them the hope that when they returned there some twenty-four years hence, at the next meeting of the British Association in Bath, they might see other works as extensive and as interesting as those which he had described to them that day.

## TESSERÆ.

Raphael's Cartoons.

F. W. MOODY.

THE change of Raphael's style may be stated as an increase of amplitude and mass rather than of any principle of construction, and in his early manner the limbs are more attenuated, the draperies more scant, than in his later works. This change is not peculiar to him. In the progress of art generally, as well as of each individual artist, the tendency is to become broader and more ample. The young student invariably draws the limbs more elongated and meagre than they really are; and I have often surprised a pupil by measuring the true proportion on his work. It is amusing to hear critics condemn those who have adopted a broader style than they approve. They call them "sensual," "pagan," and many hard names, forgetting that all their criticism, however ingeniously they may attempt to conceal it, can never mean anything more than "I like this," "I don't like that," and it is far more likely that the "I" should be wrong than the work they criticise. A sour ascetic will condemn amplitude; a man in the vigour of mature knowledge will perhaps think the earlier work shows more weakness than devotion. There is room for all. There is art to every man's taste; and if ever the public could be brought to understand what the criticism of the day really is, it would speedily become extinct—a consummation devoutly to be wished. The student should carefully study those works which are easily accessible. First of all the "cartoons"; for though little of the actual execution can be attributed to Raphael, the composition is undoubtedly his. The expression of the faces, the action of the figures, combine to tell the story in a way that is at once effective, dramatic, and simple. They are large, manly, free, decorative works, the execution is what in these days would be called "Academic"—in other words, it is the straightforward work of men who knew their business and did it. If they had stopped to talk, or even to think, of half the nonsensical refinements that critics now pretend to see in their work, they would never have got through the job; for the drawings had to be done in a given time for the tapestry weavers to work from. Incomparably the finest part of the cartoons is the heads of the Apostles in the *Charge to Peter*. These are painted with all the care bestowed on an easel picture, and are probably by Raphael himself. If the nude is sometimes treated in the grandest manner, as in *The Sacrifice at Lystra*, it is at other times positively bad, as in the arm of the cripple at *The Beautiful Gate*. The feet are generally good, the hands as generally indifferent. The draperies are finely cast, and, for the purpose for which they were wanted, magnificently painted. I have reason to suspect that the present state of the cartoons suggests a finer quality of colour than they really had when new.

Ypres.

G. E. STREET.

I reached Ypres in time to spend the afternoon in sketching and studying what is perhaps the noblest example of the Domestic work of Germany. Les Halles, as this great pile of building is called, seems to have been a great covered mart rather than a mere town-hall; and when I was there a fair was being held within its walls, and, filled with picturesque groups of people, and stalls for the sale of every conceivable kind of merchandise, the grandeur of its size and design was well seen. The main portion of the building is of uniform early Middle-Pointed date, and forms an immense and rather irregular parallelogram, enclosing some long and narrow courts. The principal front towards the market-place is, by a rough measurement which I made, about 375 feet in length, very uniform in its design, but broken in the centre by a fine lofty engaged tower, surmounted with a spire, finishing in a sort of louvre of modern character. The whole effect of the building is incon-

ceivably grand, leaving behind it in point of general effect even (I am bold in saying it) the Ducal Palace at Venice. In elevation the main building is divided into three stages. The ground stage consists of a succession of openings with square heads, trefoiled; the next of a long series of two-light windows with quatrefoils in the head, the openings in which are square, the tracery not being pierced; and the third stage has again an immense succession of traceried openings alternately glazed and blank. The whole is surmounted by a lofty traceried parapet corbelled out, and the steep (and original timber) roof is surmounted with a ridge-crest of stone, of more delicate character than I have ever seen elsewhere. The front is finished at the angles with immense octangular pinnacles, corbelling out at their base from the wall, and the tower, which rises two stages above the ridge of the roof, has also at its angles similar pinnacles. The general *motif* of the entire front is continued happily in the steeple, the faces of which are occupied with rows of lofty windows of two lights. From the belfry, and from within another corbelled parapet, springs the spire, which, at first square, becomes below the tourelle on its summit an octagon. Immediately behind Les Halles stands the cathedral. This has a fine western tower, built cir. A.D. 1380, and remarkable for the triple buttresses at its angles. The west door is double, and set within an enclosing arch with the west window, in a common German fashion. The interior is lofty and spacious, with cylindrical shafts, whose capitals have simple foliage of the thirteenth century. The triforium is good, and some of the clerestory (*e.g.* that in the south transept) is also early and good; but the whole church is not by any means of the first order. The south transept has recently been very creditably restored, the new carving being executed with much spirit. The east end is remarkable externally for its tall buttresses, without weatherings, and for the deep arches under which the windows are set, and which give the building too much of a skeleton effect to be pleasing. A rather graceful turret (of Renaissance character) surmounts the crossing. The cathedral and Les Halles, though close together, are not absolutely parallel, but the combination of the two buildings, with their towers and turrets, and two other towers, is very good, and gives an imposing effect to the general views of the old city. It is to be observed that though in Les Halles the pointed arch and the very best window-tracery are everywhere used, there is no possibility of mistaking it for a church, or even for a religious building. There are many old houses in the town, generally of the sixteenth century, with stepped gables, and four-centred window-heads with carved tympana; but their effect generally is not satisfactory.

## Italian Gothic Doorways.

R. WILLIS.

The Italian enriched doorways appear to me to be by far the best specimens of their Middle Age work, and they are fortunately extremely well preserved. Every other part of the building is liable to transformation, and frequently suffers more or less from the intrusion of new ornaments or the destruction of old. The interiors especially may be found with every gradation of change, from the mere alteration of a few capitals to the complete mask of plasterwork which transforms the Gothic cathedral into the pseudo-classical hall. Even the windows may have their tracery removed, but the doorways seem to have been always respected, and allowed to remain; even when the original building has been taken down from behind them and an entirely new one erected. The same fortune has always attended doorways. How often, for example, the Norman doorway is found encrusted in the Early English façade of our own country. The complete doorway of the Middle Ages may be considered as composed of three distinct parts. A *door-archway* occupies the thickness of the wall, and is richly decorated, being generally a compound archway of many orders and various decorations. Within this is the doorway properly so called, which is seldom of the same height or figure as the archway, while the space between them is decorated with figures or emblems, alluding to the purpose for which the building is destined, the saint to which it is dedicated, and so on; or else may be filled with tracery. The whole of this may be termed the *doorway-plane*. Beside these the external face of the wall about the archway is generally occupied with some canopy, porch, roof, or other ornaments, which may be termed the *extramural decoration*. The complete doorway, therefore, is made up of the doorway-plane, door-archway, and extramural decoration.

## The Atrium in Roman Houses.

W. RAMSAY.

This for a long period was the most important apartment in a Roman house. It was generally more spacious than any other, and existed in some shape in every mansion, great or small, from the earliest down to the latest times. It was always placed opposite to the principal entrance, and was in the great majority of cases lighted by an aperture in the centre

of the ceiling, open to the sky, which was called *impluvium*, because the surrounding roof sloped towards it so as to conduct the rain down into a reservoir called *compluvium*, formed in the pavement below for its reception. The atrium was originally the public room, open to all members of the family, to friends, and to visitors. In the middle was placed the fireplace of the house (*focus*), where all culinary operations were conducted, the smoke escaping through the impluvium above; beside the focus a small altar was erected, upon which were placed the offerings to the domestic gods, the Lares and Penates, who occupied niches hard by, and the focus being the spot farthest removed from the exterior of the mansion, the space which it occupied was sometimes termed *penetralia* or *foci penetrales*. In the atrium stood the marriage couch (*lectus genialis*), immediately opposite to the door, and hence it was sometimes distinguished as *lectus adversus*. Here, too, all the members of the household shared the common repast; here stood the looms; here the mistress plied her labours surrounded by her maidens; here the master received his visitors; here, when a death occurred, the corpse was laid out previous to the funeral, with feet towards the outer door; and here were arranged the waxen images of illustrious ancestors, in which Nobles took such pride. This description must be understood to apply, in so far as persons belonging to the higher ranks were concerned, to the primitive ages only, when the atrium was the sole public apartment. In process of time separate rooms for cooking, for banqueting, and for carrying on ordinary domestic toils were constructed, a private chapel was provided for the gods, and in the houses of the great the atrium was set apart for the reception of clients and of those who sought assistance from, or desired to testify their respect for, the lord of the mansion.

#### The Conditions of Progress.

J. FERGUSSON.

What is wanted to insure progress towards perfection is, first, that we shall have a public with feeling enough for the art to desire it, and with knowledge sufficient to judge of what is good and beautiful; a body of architects so intelligent as to be able to grasp the condition of the problem, and with taste enough to design the requisite forms of expression; a class of builders with skill to arrange and energy to carry out what has been so designed; and, more perhaps than any of these, a class of art workmen so instructed and so expert that they shall be able to understand the work they have in hand, and so skilled as to be able to execute it thoughtfully and well. Many of these elements we already possess, and are progressing towards the attainment of the rest. But even all these will be of no avail unless every class is thoroughly imbued with a conviction that architecture is neither more nor less than a true and progressive development of a useful art into a fine art, but which can never throw off its connection with its parent, nor can ever be practised on any other principles than those which alone have led to the elaboration of other useful arts into their æsthetic developments. In addition to this, it is indispensable that the public mind should be thoroughly disabused of the idea that archæology is architecture, or has, in fact, any direct connection with it. It never was so when art was a living thing, and there is no logical reason why it should be so now. Once this error is exploded, and we really set in earnest to elaborate building with truth into architecture, there seems no reason why we should not surpass all that has been done up to this time. We have more wealth, more mechanical skill, more refinement than any nation, except perhaps the Greeks, and taste (even if not innate) may result from the immense extent of our knowledge.

#### Tarquinius Mural Paintings.

E. BRAUN.

In a room of the Lateran Museum, entered by a narrow passage from the bronze gallery, are placed copies of the mural pictures discovered in the Necropolis of Tarquinii between the years 1827 and 1831. These, notwithstanding their deficiencies as works of art, are important for such persons as wish to make themselves acquainted with the principles of the pictorial stylisation of the ancients. We here find a remarkable phenomenon, the colours employed to give animation to the figures and other objects being restricted within very narrow limits. The four principal colours of the prismatic spectrum have been made the foundation; and wherever a varied play of colour is developed in the actual object the general impression has been reduced to certain chromatic formulae, which at first sight awaken our wonderment. When we see blue ducks, nay, light-blue horses, we look upon it as not only unnatural, but even in direct opposition to Nature. On a closer examination of such a scale of colours we discover, however, that their treatment rests upon analogies recognised also in the language of poetry, and that by this strict limitation an end is achieved resembling that exhibited in the stylising of the forms of plants intimately connected with architecture, or even completely blended together, as in the ornamentation of a Corinthian capital. Hence in these paintings we see green leaves, grey

fowls, light-coloured horses, and glittering metals all given without distinction as light blue. In a similar manner, we find the three other colours substituted for the natural ones, the treatment of the outlines likewise corresponding to this conventional style of painting, its antiquated stiffness being by no means founded on artistic incapacity, but resulting from the positive intention of treating these mural decorations as an integrant part of the architectural surroundings, and therefore in a manner strictly conformable with these. The play of lines exhibited in the varied attitudes and artificial arrangement of the figures is, therefore, very limited, and subjected to metrical laws in the same manner as the language of the poet, which is likewise measured in its expressions, and in reference to the thought frequently very restricted. Would we analyse and pass judgment, according to scientific principles, upon the works of modern art undertaken in a kindred spirit, we should necessarily have to fall back upon these oldest attempts at pictorial stylisation, and, by the help of comparison between corresponding phenomena, endeavour to discover the laws to which alone such productions are subjected. These representations relate to banquets, festal dances, public games, and burials. In some the Etruscan physiognomy is strongly marked; in others it appears more softened. It is the same type still to be seen in the inhabitants of Corneto, a town known to be situated in the neighbourhood of the ancient Tarquinii. These pictures differ in this respect in a very remarkable manner from the greater part of the vase-paintings in which the Greek ideal prevails, although both lines of art are governed by precisely the same principle.

#### The School of the Carracci.

R. N. WORNUM.

Lodovico Carracci, the founder of the eclectic school of Bologna, was born at Bologna, April 21, 1555. He was placed with Prospero Fontana; and while in his school his apprehension appeared to be so slow that, like Domenichino afterwards, he was called by his companions the ox, *il bue*. He afterwards entered the school of Passignano at Florence, and studied the works of Correggio and Parmigiano at Parma, those of Giulio Romano at Mantua, and those of Titian at Venice. The works of these and other masters afforded the elements of the eclectic style of the Carracci, as expressed in the well-known sonnet of Agostino:—"Let him who wishes to be a good painter acquire the design of Rome, Venetian action and Venetian management of shade, the dignified colour of Lombardy, the terrible manner of Michel Angelo, Titian's truth and nature, the sovereign purity of Correggio's style, and the just symmetry of a Raphael; the decorum and well-grounded study of Tibaldi, the invention of the learned Primaticcio, and a little of Parmigiano's grace; but, without so much study and toil, let him only apply himself to imitate the works which our Niccolino has left us here." The last sentence, which is a mere compliment, refers to Niccolò del Abbate. This sonnet sufficiently explains the principles of the eclectic school, and, at the same time, shows their mere technical tendency. The school of the Carracci was opened in 1589, and carried on by the cousins conjointly up to 1600, from which time it was conducted by Lodovico alone until his death (December 13, 1619), which is said to have been considerably hastened by some errors in the fresco of the Annunciation in the cathedral of Bologna, his last work. The frescoes of the convent of San Michele in Bosco, from the life of St. Benedict, commenced in 1602, after Lodovico's short visit to Rome, and which were generally considered his masterpieces, have long since perished, though the designs are preserved in the prints of G. M. Giovannini, "Il claustrum di San Michele in Bosco di Bologna, &c.," published in 1694, with descriptions by Malvasia. There are thirteen pictures by Lodovico Carracci in the gallery of the Academy at Bologna, including some of his most celebrated works in oil. In the opinion of Sir Joshua Reynolds, no painter knew how to harmonise the treatment of a picture with its subject better than Lodovico Carracci. "Style in painting," says Sir Joshua, "is the same as in writing, a power over materials, whether words or colours, by which conceptions or sentiments are conveyed. And in this Lodovico Carracci, I mean in his best works, appears to me to approach the nearest to perfection. His unaffected breadth of light and shadow, the simplicity of colouring, which, holding its proper rank, does not draw aside the least part of the attention from the subject, and the solemn effect of that twilight which seems diffused over his pictures, appear to me to correspond with grave and dignified subjects better than the more artificial brilliancy of sunshine which enlightens the pictures of Titian." The scholars of the Carracci produced a change in all the schools of Italy; but the qualities of their works, in contradistinction to those of the great masters of the preceding century, are strictly technical or material. They remained as much below the great masters of Rome and Florence in expression, composition, and character, as they surpassed them in general execution. The most distinguished masters of this school were Domenichino, Guido, Albani, and Lanfranco.

## ILLUSTRATIONS.

## HOUSE AT HEATON.

THIS house, of which we illustrate the entrance front, is in course of erection for Dr. G. W. GRABHAM, and occupies an elevated site overlooking the reservoir and Manningham Park, beyond which a distant view of Bradford is obtained. It contains in the basement a large billiard-room, wash-kitchen, larder, wine and coal cellars; on the ground floor the porch gives access to a cosy little hall with fireplace, from which on the left are arranged lavatory, butter-pantry, store-room, kitchen, and scullery, with back staircase adjoining; on the right are three reception-rooms and conservatory communicating; recessed fireplaces are planned, and will be seen in a view from the south-east, of which we propose to give an illustration. The principal staircase leads to four bedrooms, bath-room, water-closet, lavatory, linen-room, and housemaid's closet on the first floor; two bedrooms and cistern-room are provided on the second floor, reached by the back staircase. The materials used are self-faced wallstones to the plinth, hammer-dressed above, with ashlar to window jambs, &c., and the whole of the porch. The roofs are to be covered with red tiles, and the interior woodwork is to be of the best selected pitch pine. The mason's work is being carried out in a most substantial manner by Mr. HENRY HUSTLER, of Bradford, under the superintendence of Messrs. H. & E. MARTEN.

## RESTORATION OR DESTRUCTION?

THE church in the village of Cossey, Norfolk, has given rise to much correspondence, from which the following is extracted:—

Dr. Jessopp lately received a request by post to contribute towards the "restoration" of Cossey Church. Knowing nothing of what had been going on, he writes, I at once drove over to survey the ground, and was overcome by dismay. I remembered but imperfectly a beautifully proportioned structure, for the most part of early fourteenth-century workmanship, consisting of a nave, with windows still retaining large portions of the old stone mullions and tracery, the roof in a rickety condition, the seating shabby, ugly, and inconvenient. There was a superb screen separating this nave from the chancel, and I found chancel and screen pretty much as I had seen them some years ago. Of the ancient nave its walls alone remain. Every record of the past, every vestige of anything that could suggest a reminiscence of that past, every faint hint that the life and faith of that past had any link of connection with the present, has been brutally obliterated. Everything of beauty has been swept away. The old stone mullions of the fourteenth-century windows have been torn out, the very jambs hacked away; there they lie in a heap outside, doomed sooner or later to be utilised for the "restoration" of a pigsty or the construction of a silo. In their place there are not honest sashes with weights and cords, but constructions of white brick, the ingenious moulders having set themselves to present the beholders with a fancy portrait of the ancient tracery and cusping in cooked clay. There stands that astounding structure,

One more triumph for devils, and sorrow for angels,  
One wrong more to man, one more insult to God!

All this was past remedy; but that screen and the chancel behind it remained intact a fortnight ago. There were in the chancel five windows of rare ingenuity and beauty of design, containing considerable fragments of brilliant stained glass—the stonework in remarkably good preservation—one of the windows in the north wall presenting some characteristic features which, as far as I know, were unique. The roof was a trussed rafter roof of the early part of the fourteenth century, the moulding of the wall plate being exceedingly rich, and doubtless designed and executed by local craftsmen, the rude forefathers of the hamlet, whom we take such special pains to help their posterity to pity and despise. The screen was thickly covered with white paint, yet not so thickly as quite to hide the exquisite carving of the spandrels, bearing upon its

every line the evidence that a born artist had there given play to his genius and worked at it as a labour of love. To "restore" this chancel I had been asked to subscribe from my scanty means—to restore, mind, not preserve; and when I asked what was intended in this case by the term "restoration," I was proudly told that it had been agreed by a large majority of the parishioners to substitute for those chancel windows others of a more sightly and convenient pattern, to harmonise with the triumphs of brickwork in the nave. As for the screen, nobody wanted it; it was to be got rid of somehow; my informant did not quite know how. When I asked where the money was to come from, I was told confidently that the trustees of the great hospital had voted 250*l.* towards the completion of the work.

Next week a representative of the Society for the Protection of Ancient Buildings was sent down to report upon the condition of affairs, and a very temperate letter was addressed to the trustees, and a representation was made to the archdeacon to the effect that no faculty ought to be granted to any one to meddle with the chancel without due notice, and without giving opportunity to those whom it concerned to enter objections to any plans that might be presented. But the money had been voted and the Vandals were not disposed to lose time. They applied, it seems, last week for their faculty—(1) for replacing the windows with others "of a similar character"; (2) for removing the present roof and substituting another similar to the nave; (3) for replastering walls and general repairs. Not a word about the screen.

The surveyor for the county of Norfolk happens to be an inhabitant of Cossey; he gave notice of his intention to oppose the granting of this faculty, and was waiting quietly for the day appointed, when, lo! on Monday, August 27, a contracting bricklayer with half a dozen labourers appeared on the scene, and forthwith the work of demolition began in earnest. Before the day was done the roof was more than half stripped off, the unique window in the north had been taken out bodily, and almost all the old stained glass destroyed. Meanwhile I understand no faculty has been granted—that is, no authority has been given for this outrageous demolition. The Vandals laugh at faculties. Why should they not laugh? They have won the day.

An answer to the foregoing appears in the *Times* of Wednesday from Mr. Gunter and Mr. Brett, churchwardens of Cossey, who write:—We distinctly say that not only has Dr. Jessopp been misled by his informant, but also by his own recollection of this church, which he acknowledges to be but imperfect. Dr. Jessopp says he remembers seeing the nave windows still retaining large portions of the old stone mullions and tracery. This is not true; no record exists in the parish of the removal of this tracery, neither has the oldest inhabitant any recollection of it; but it was entirely removed, and square-headed wood frames inserted. The upper portion above these frames was filled up with brickwork and plastered over. Small portions of the old jambs and mullions, repaired to a considerable extent with cement, existed until the present work was commenced. When these wood frames were removed, and the brickwork taken away from the arches, several pieces of the old tracery were found, having been broken up and used to fill up the space above the frames. This fact must have been known to Dr. Jessopp's informant, and, in justice to those who are responsible for the work, ought not to have been withheld. Dr. Jessopp says there were in the chancel "five windows of rare ingenuity and beauty of design, containing considerable fragments of brilliant stained glass." There were four old windows in the chancel. The east window was inserted by the present vicar, and is but twenty-five years old. Stained glass existed in two of these windows only. One of them has been removed, and the glass not destroyed, as Dr. Jessopp says, but carefully preserved at the Vicarage. The whole of the stained glass in both windows, carefully measured, does not give two superficial feet, and this is called by Dr. Jessopp "considerable." Now for its brilliancy. Since his letter appeared in your issue of the 3rd inst., it has been copied into the local papers, and has been read by many residents. We are asked every day, "Where was this beautiful glass?" I have attended the church all my life and never saw it." This is a fact—that persons who have resided in the village all their lives had never observed this "brilliant" glass. Our church was in a wretched state; we received frequent complaints of the water coming through the roof; the damp and the cold draughts of air made it impossible for persons in delicate health to attend the church in winter, and the attendance in consequence was meagre in the extreme. We appealed successfully to the public, and found ourselves with 600*l.* Archaeologists had not troubled us in the past; but now we had money to spend we were besieged with advice, and had we followed all of it our church would now be a miserable jumble of fads and crotchets.

Mr. R. Herbert Carpenter, F.S.A., writes:—Some little time back there was made to the Incorporated Church Building Society an application, accompanied by plans, for a grant of money in aid of the so-called "restoration" of the church

When, in due course, these plans came before the honorary committee of architects advising the Society, they regarded the proposals set forth in the plans with absolute horror, and protested against them. Afterwards, on certain information and photographs being at their request sent to them, Mr. Ewan Christian studied them with me, and he formed so strong an opinion against the work proposed, and in favour of the possibility of preserving so very interesting a church, that he determined to visit it and see it for himself. At another interview Mr. Christian expressed to me his great satisfaction in having ascertained that the opinion he had formed was a correct one, and that he was convinced that by careful and conservative repairs, not only might the ancient windows (now replaced by the ready-made terra-cotta ones proposed in the plans!) be retained, but that the design, and probably also some of the old oak timber of the nave roof, might be preserved. He was strongly of opinion also that a certain local peculiarity in the arrangement of the seats was ancient; but it is, perhaps, in vain to hope that this is to remain unaltered. Mr. Christian is now away from town, but I feel sure that I am expressing his views on the subject, and that he would join in protesting with all his might against the havoc which has been wrought. Such a system of "restoration" we must all of us feel discredits the term used to describe it; and as antiquarians we know that it is in every way antagonistic to the principles laid down in the "Paper of Suggestions" which the Council of the Royal Institute of British Architects have (with the aid of Mr. Pearson, R.A., and Mr. Blomfield, A.R.A.) revised and re-issued to its members, as well as to those concerned in works of church restoration. I may add that the chancel work was not, I think, contemplated by the plans submitted, but its destruction is even more, if possible, to be regretted than that of the less perfect nave. I remember some few years back sketching its remarkable and very beautiful windows, unlike, in some respects, any others I had seen.

A letter has also been published from the Society of Antiquaries, with a lengthy addendum in the shape of what Lord Grimthorpe calls "the Antiquaries' Encyclical on Restoration." Lord Grimthorpe's contribution to the controversy appears in another column.

#### PRESERVATION OF ANCIENT MONUMENTS.

AT the meeting of the British Association in Bath, Lieut.-General Pitt-Rivers, the president of the Anthropological Section, in the course of his address drew attention to the working of the Act for the Preservation of Ancient Monuments, with the carrying out of which he had been entrusted during the last five years. No owner, he said, except one, has voluntarily offered any monument to be put under the Act; all have had to be sought out and asked to accept the Act, and of the owners of scheduled monuments the larger number have refused. Sir John Lubbock was chiefly instrumental in passing the Bill through Parliament, although in the condition in which it actually passed it was not his Bill. He had proposed to make the Act compulsory in the case of some of the more important monuments, but the proposal had been overruled on the ground of its being an improper interference with private ownership. Sir John Lubbock, finding that the Act in its improved stage was purely permissive, and not believing that anyone would voluntarily make use of it, at first refused to include his own monuments, and it was only after I had obtained others, and success appeared probable, that he consented to put Silbury Hill under the Act. The accompanying map of Great Britain shows the monuments that I have been the means of obtaining by the consent of their owners. Having named these and given some particulars of each, the author continued. It speaks well for the landowners that so many should have been willing to accept the Act, considering that few of them take much interest in antiquities. There is not a more public-spirited body in the world than the much-abused landowners of England. Those who have refused have generally done so on the ground that they wish to remain responsible for their own monuments, and there is very little damage to prehistoric monuments going on at the present time. Public opinion has done more than any Act of Parliament could do, and it is generally known throughout the country that any wilful damage to the monuments would be universally condemned. The Government are made responsible for all the monuments that are included, which entails expense, and as members of Parliament generally take very little interest in ancient monuments, and the great object of Government must always be to curtail expenditure, additions to the list are not as a rule encouraged. I last year obtained eleven new monuments, but I was told that this was too many and that some must be omitted, so I omitted three of the least important. At present local archaeologists wash their hands of the matter, thinking that there is a Government inspector whose business it is to look after the monuments. This is a mistake; the proper function of the inspector is simply to

look after the monuments that are included, and to advise the Commissioners—not to obtain new monuments for the Act. You cannot insure always having a landowner for an inspector, and it is desirable now to put the Act on a working footing. It is much to be wished that local archaeological societies should be made to feel themselves responsible both for the inclusion of monuments under the Act, and their preservation afterwards; the Act arms them with full powers for the purpose if they think proper to use it. At present no archaeological society has rendered any assistance whatever, but Sir Herbert Maxwell, in Galloway, has not only offered his own monuments, he has persuaded his neighbours to do the same. What Sir Herbert Maxwell can do others equally public-spirited can do also. It should rest with them, because, being local, they can do more than a single inspector charged with the supervision of the whole of the monuments of Great Britain. The Government should continue to appropriate a small sum (it is now under 200*l.* a year) to apply to such purposes as may be thought desirable, such as building sheds to preserve the monuments, but they should not necessarily be held responsible for all the monuments placed under the Act, and the Bill, being a permissive one, it should rest with the public to make use of it or not, as they may think proper. As long as the owner of a monument takes an interest in it, he is the best person that the public can look to for the preservation of it.

#### PERMANENCY OF WATER-COLOURS.

A PAPER on "The Action of Light on Water-colours" was read by Dr. Arthur Richardson, at the meeting of the British Association. In it he discussed the effect of light on colours, and drew attention to the very important part played by moisture in assisting their decomposition. Colours were divided into two groups:—(1) Those which bleached by oxidation under the combined influence of light, air, and moisture; (2) those on which light exerted a reducing action, which was independent of the air, and in some cases took place in the absence of moisture. Cadmium yellow, cadmium orange, king's yellow, and indigo were placed in the first group; these were shown to bleach by light, under the conditions above stated, but were permanent in an atmosphere of carbon dioxide, or in dry air. The colours of the second group included Prussian blue, vermilion, lakes, gamboge, &c. Prussian blue faded in moist air—much more readily, however, in an atmosphere of carbon dioxide; but it was permanent in dry air. Mixed with cadmium yellow, Prussian blue gave a green which was very sensitive to light if moisture was present; permanent, however, in dry air. Vermilion was shown to fade in dry and moist air; also in an inert atmosphere like carbon dioxide. With cadmium yellow an orange was formed which blackened in moist air in a few hours, though in dry air light was without action on it. He condemned as unsafe those pigments which faded in dry air, and showed that the greater number of paints were stable in sunlight, provided moisture was absent.

#### DUNFERMLINE ABBEY.\*

THE historical accounts of many parts of Scotland previous to the twelfth century, the author said, were made up in a great measure of tradition and fable, and in that respect Dunfermline and its vicinity were no exceptions. As to the name of the town, a number of conjectures had been made. It was, however, now generally agreed that the name was derived from the castle of King Malcolm Canmore, a fragment of which building was still to be seen upon the steep ground known as Towerhill, in the policies of the estate of Pittencreeff in the immediate vicinity of the abbey and palace. The etymology usually adopted of the word Dunfermline was the Gaelic *Dun-fear-linne*—the castle by the crooked stream—though many other renderings had been suggested. The tower or castle which that name referred to, appeared, from measurement of the remaining walls and the foundations, to have occupied the greater part of the top of the eminence. It was thought to have been a square tower, or keep, of two storeys, with a high roof, and presenting an appearance in its principal part very much as was shown in the arms of the burgh as now blazoned. That castle was the residence of King Malcolm when he received and hospitably entertained the Princess Margaret of England, who, with her relatives and retinue, were driven by stress of weather into the Firth of Forth on their passage to the Continent, after the conquest of England by William. Mr. Freeman, however, in his "Norman Conquest," stated that after the defeat of Edgar Atheling by the Conqueror near York, Edgar with his sister Margaret and their retinue, went to

\* From a paper read by Mr. George Robertson, F.S.A. Scot., on "The History of Dunfermline Abbey and Palace," on the occasion of the visit of the members of the British Archaeological Association.

Monkswearmouth, where Malcolm, King of Scotland, was then with his army. Malcolm had an interview with Edgar, and, hearing of his hopeless condition, advised him to sail immediately for Scotland and take up his residence with him in Dunfermline. The advice was taken, and the illustrious exiles set sail for Scotland in the month of October 1069. The place of their disembarkation was to the west of Queensferry, in that part of the Firth known as St. Margaret's Hope. It was supposed that they landed at the promontory on the north side, now occupied by the Castle of Rosyth—anciently Resythe—which name might probably be derived from "Res-hythe" or Queen's landing-place. That castle and St. Margaret's Hope could be seen from the abbey, from which they were about four miles distant. In the year 1070 the nuptials of Malcolm and Margaret took place, as recorded by Fordun, not far from the bay of the sea where she landed, and were magnificently celebrated at a place called Dunfermline, which the king then had as his fortified residence. Sir James Balfour, Lord Lyon King-at-Arms, in his "Annales of Scotland," referred to the marriage of the Princess Margaret with King Malcolm as having been "accomplished with grate solemnity at his village and castell of Dunfermelin in the Woodes, in the 14 yeire of his raigne, in Anno 1070." About the year 1075 the Abbey of Dunfermline was founded by King Malcolm, at the suggestion of Queen Margaret. The church was dedicated to the Holy Trinity, and appointed to be the future royal burying-place in room of Iona. The tomb of Queen Margaret—constructed of massive slabs of mountain limestone, in which were many curious fossils—was still to be seen outside the present church, but within the ruined walls of the lady chapel of the old building. The tomb had recently been enclosed by an iron railing by Her Majesty's Board of Works, who were custodians of the abbey and palace. The remains of Queen Margaret were removed from the still older portion of the church to that tomb on the completion of the eastern church in 1250. The Norman church of Queen Margaret—or Saint Margaret, as after her canonisation she was designated—was still in good preservation, having been thoroughly repaired and strengthened by Government some years ago. Its architecture was somewhat rude, but the internal appearance of the building was lofty and the general effect imposing. The eastern portion of the church, which was erected in 1250, was almost totally destroyed at the Reformation, when the Reformers came—

Wi' picks and spades,  
And wi' John Knox into their heads,  
Dinging the Abbeyes doon.

All that now remained of that eastern portion of the church were the small parts of the lady chapel around St. Margaret's tomb. The following was a copy of a warrant for the destruction of the abbey, dated 1560:—

Traist freindis, after maist hearty commendacion, we pray you fail not to pass incontinent to the Kyrk of . . . and tak down the hail images thereof, and bring furth to the Kirk-zayrd, and burn them oppinly. And siclyk cast down the alteris, and purge the Kyrk of oll Kynd of monuments of idolatrye. And this see fail not to do, as ye will do us singulare empleaseyr, and so committis you to the protection of God. Fail not bot se tak guid heyd that neither the dasks, windocks nor durris be ony ways hurt or broken, either glassin-wark or iron-wark. Fro Edinburgh . . . 1560.

(Signed) AR. ARGYLE.  
JAMES STEWART.  
RUTHVEN.

The work of destroying Dunfermline Abbey commenced on March 28, 1560. The tomb of King Robert Bruce was immediately below the pulpit of the present new church, but there was nothing to mark its place but the large stone lettering on the parapet of the lantern tower immediately above the spot where he lay. The architecture of the oldest part of the church was very interesting as an example of the earlier Norman, the west doorway in particular being well worthy of notice. The present steepled tower had been erected upon part of an earlier tower, probably about A.D. 1440, which date was to a certain extent indicated both by the architecture and by an heraldic shield which was cut out on a boss in the vaulting of an adjoining bay of the same architecture. That shield bore the arms of Abbot Bothuel, or Bothwell, who was Superior of the abbey at that time. The pointed arches and clustered columns at the same part also lend testimony to that idea of date. Queen Margaret's arms—those of Edward the Confessor, her granduncle, being a cross fleury between five martlets—were also cut on a boss in the vaulting of the adjoining bay. For many years there had existed an erroneous idea that the steeple, the north porch and the bays referred to were erected by James VI., but that idea had of recent years been abandoned by many who had made a close study of the architectural and heraldic features. The south tower was modern, having been erected early in the present century, to replace a Norman tower which fell in 1807. The buttresses on the north and south sides of the church were of much later date than the original building; one of these—on

the south—bearing the date of 1620, and another—on the north—that of 1675. Those buttresses had evidently been much needed to strengthen the walls, which still in some places showed a slight inclination from the perpendicular. Many later works and repairs were carried out by William Schaw, who was architect to James VI., and to whose memory and honour a monument was erected by Queen Anne in the north aisle, but now stood at the base of the steeple tower. On the monument was an interesting square of marble, with the monogram "William Schaw" in interlaced letters. It was said that this monogram had been cut by Schaw himself, and was inserted in his monument by Royal command. The long inscription on the front of the monument was in Latin, and bore testimony to his worth and abilities. He was therein styled "Master of the King's Work, Sacrist, and the Queen's Chamberlain." At the east end of the north aisle was a monument to Robert Pitcairn, Secretary of State, who died in 1584. To better show a modern stained-glass window, the upper part of that monument had, in questionable taste, been removed, and now stood within the western doorway. Both that monument and that of Schaw were ornamented at the upper sides by the scrolls known as "Scottish." At the east end of the church the Norman pillars were incised by spirals and chevrons, or zigzags similar to pillars in Peterborough and elsewhere. Before the erection of the church of 1250 the high altar stood between those pillars, the east end of the church being very likely formed by an apse, as in many other churches of similar date. There was nothing left, however, but the ornamented pillars to make that surmise certain. After the Reformation, gallery seats or "lofts" were erected between the pillars. The carved front of the Royal pew, with the date of 1610, which was between two of those pillars, was still preserved in the north transept of the new church. The side panels of it, bearing names of illustrious persons buried in the church, were modern, and were placed there in a great measure to fill up the wall space. This old piece of woodwork was a very good specimen of the woodcarver's art at the time of its erection. Other gallery pews—principally those of the nobility and the incorporations of trades—were erected between the pillars of the old church, but that front of the Royal pew was all that now remained.

Many of the windows of the old church had of recent years been filled with coloured glass designs. In the south aisle there was a much-admired window to Annabella Drummond, Queen of Robert III., and mother of the murdered Duke of Rothesay. It was erected by Lady Willoughby d'Eresby to the memory of her royal ancestor. The large window in the west wall had also recently been filled with historical glass, at the cost of Mr. Andrew Carnegie of New York, who was a native of Dunfermline. The design of that window was by Sir Noel Paton, who was also a native of the town. The design embraced figures of King Malcolm, Queen Margaret, King Robert Bruce, and William Wallace, with appropriate accessories and heraldry.

The monastery was situated to the south of the church, the only remaining portion being the south and west walls of the refectory or Frater's hall. In the west wall was a large and handsome window, seemingly of fourteenth-century work. In the centre of the head-lights there was a peculiar figure, somewhat resembling a heart, a crown or a monogram, but no satisfactory explanation of its true meaning had yet been arrived at. At that point there was a connection between the monastery and the palace, in the form of a massive pended tower, underneath which the public road now passed. The ground to the north of that "pend" was the palace yard—a large open space between the abbey and the palace, and upon which both fronted. At the north side of that yard there was another pended tower, in which was the north gate of the palace. Very little now remained of the palace but the west wall, built upon a steep slope, at the bottom of which was the water of Lyne or "Tower-burn." From the portions of the palace that remained, it could be seen that many alterations had from time to time taken place in its structure. The windows in particular had undergone a great change. They were originally Gothic, and of very wide dimensions, but had been altered to square or Tudor. In the soffit or ceiling of one of the upper windows there was a large sculptured stone bearing a representation of the Annunciation. That carving was supposed to have formed part of an altar in the Abbey, or the tympanum of an arched door or window, and to have been removed to its present position at the Reformation. When discovered in its present position it had been plastered over, as if for concealment. Charles I. was born in this palace in 1600. The room generally pointed out as the place of the birth of Charles was that of the Annunciation Stone, but he was much of opinion that it was a room in the same storey at the west, or newer, part of the building. The kitchen of the palace was a large unroofed apartment, and had two spacious fireplaces. The iron cooking grate or range of one of these was now in Her Majesty's Office of Works, Edinburgh. A communicating passage through the pended tower, and a wheel stair, led from

the monastery to the kitchen—the brethren having a right of certain supplies from the latter place. Underneath the kitchen there was a large vaulted room, locally known as the “magazine,” from the fact of its having been used during the civil wars as a store for ammunition. It had the appearance of a chapel or crypt, and from its architecture had evidently formed originally part of the monastery, and not of the palace. At the north-east corner of that vaulted room was the entrance to a dark passage, which appeared to have been an underground communication between the monastery and the church. On a recent exploration it was found that the passage led in that direction, but about 90 feet from the entrance it was found to be built up. It seemed quite likely that, although at one time a thoroughfare for the brethren, it had been broken at the upper end by the formation of the public road and other changes. The passage was arched with groins or ribs at intervals, and was over 6 feet in height from the paved floor, though in places, from the accumulation of earth and other matter, it was now much less.

### CURRICULUM FOR ARCHITECTURAL STUDENTS.

**T**HIRTEEN years since the Council of the Manchester Society of Architects issued an address to architectural students of their district, accompanied by a list of books for study and reference. The Council, believing that considerable service was thus rendered to students, have just issued a second address with a revised list of books. A course of study for each year, as drawn up and recommended by the Council, is also given, from which the following is taken:—

*First Year.*—The student should be relieved as much as possible from fixed office work, and should devote about half his time to perfecting himself in mathematics, practical, plane, and solid geometry, and freehand drawing of carefully-selected examples, both from copies and also from the cast. During the time spent in the office he should endeavour to gain as much knowledge as possible of tracing and ordinary office work.

*Second Year.*—The student will, during this year, be required to perform regular duties in the office, and should endeavour to improve himself in copying and tracing drawings, and in simple colouring, such as for plans, &c. Part of the time should be devoted to measuring any building or portion of work and laying down to scale on paper, and, when practicable, to sketching portions of buildings or ornaments, especially from good examples of old work. Freehand drawing, both from copies or from the model or cast should be practised, the best course being to attend the classes at the School of Art. Building construction should be taken up; mechanics, theoretical and practical, also studied; colouring and shading may now be commenced. A knowledge of French and German is very desirable, in fact, almost necessary, and the student would do well to attend a class for the study of one or both of these languages. The history of architecture should be studied. During this year a set of quantities for some building should be obtained and carefully examined, and if access can be had to the original quantity book, it would be well to devote some time to obtaining a knowledge of casting out and abstracting the items.

*Memo.*—The student must not neglect to keep up the studies named in the first year's work, such as mathematics, geometry, &c., it being intended that the work shall be cumulative.

*Third Year.*—The student should now be of such use in the office as to be kept well employed in the ordinary better class office work, such as preparing drawings and details. Building construction should be carefully studied, and with it applied mechanics, strength of materials, strains, &c. If the student can attend a class for modelling in clay, he will find it of the greatest use in connection with his studies of ornamental work. Every opportunity should be taken of inspecting work in progress, and notes made at the building of points not fully understood, which should be inquired into afterwards. Nothing should be allowed to pass without examination, and the explanation being obtained. Careful drawing and artistic colouring should be practised; the history of architecture proceeded with, and the different styles inquired into; every opportunity taken of witnessing any experiments with materials and strengths of same, testing of beams, &c.; the preparing quantities taken up; matters connected with sanitary science studied; and the measuring of land, surveying, and levelling, if practicable, along with some good surveyor, also practised. The student is strongly recommended to sketch as much as possible, a book being constantly carried, and notes of interesting buildings or portions thereof made for reference hereafter.

*Memo.*—Keep up former studies.

*Fourth Year.*—The student must now work steadily during business hours in the office, as he will have duties to perform for his employer which must not be neglected. The evenings and

any other spare time may be occupied in the following studies:—Sanitary science, drainage, plumbing, and the detailed arrangements connected with all matters affecting health. Acoustics, ventilation, heating, nature and strength of materials and strains, with the formulæ for calculating them, composition and resolution of forces, and application of ironwork, shoring, and propping. The more advanced study of architecture should be taken up, and differences in details of styles noted, lectures attended, where practicable, and the sketch-book kept constantly in use. It would be advisable now for the student to obtain a good-sized book and collect cuttings from newspapers on subjects connected with architecture and scientific operations—these to be pasted in for future reference. Also another similar book for pictorial architectural scraps. Every opportunity should be taken of inspecting work in progress, and of examining good buildings, and notes and sketches made. During the holidays a portion or the whole of some building might with advantage be thoroughly measured and sketched, and drawings prepared afterwards. It is assumed that the ordinary office work will now provide sufficient practice in measuring, plotting, &c., so that no difficulty should be experienced in connection with the last paragraph. The student is also recommended to enter for the different competitions for prizes offered by the societies. This will be found good practice, as he will then measure his strength with others.

*Fifth Year.*—This will in all probability be the last year of the student's pupilage, and his work should be of importance to his employer, hence he will have less spare time at his disposal and will have to work harder. Specifications and contracts should be carefully examined, and every opportunity taken of composing them. A clear, concise, and correct method of describing work is very desirable. Perspective and the more advanced study of colouring and styles of decoration should be taken up, and due attention given to original design; professional practice and legal questions affecting building operations inquired into; land surveying and levelling should be undertaken, the work being plotted afterwards. Entire charge of a building under the supervision of his employer (the architect), should, if possible, be obtained. The valuation of materials and work must not be overlooked during this year, and the preparing of estimates of cost. In all probability the attendance at the School of Art, &c., will have been discontinued during the fourth year, but the student should before that time have acquired considerable proficiency in these studies. Some attention should be given to chemistry, electricity, construction of machines, &c., all of which will be found useful.

*Sixth Year.*—The student should now be out of his articles, and he will find it of advantage to pass at least a year in London as an improver in the office of some architect of eminence, during which time he should avail himself of the advantages offered by the Royal Institute and the various libraries, and of the lectures on architecture and scientific subjects which are constantly being given. During this and the next year he should prepare himself for the examination to qualify for the Associateship of the R.I.B.A., which should be the aim of all students in architecture. He is also strongly advised to do as much work as possible himself; this applies not only to drawing but to writing out specifications and preparing quantities; an intimate knowledge of the details of work will thus be obtained which will be found of the greatest value afterwards. Some attention should be given to the following matters, all of which come under the notice of an architect:—Valuation of land and buildings; examination of, and reporting on, dangerous structures; the sanitary condition of buildings; dilapidations and estimating cost of reinstatement; professional practice and legal questions affecting the profession, &c.

### COLOUR BLINDNESS.

**A**PAPER on “Colour Blindness” was read before the members of the British Association by Dr. Karl Grossmann. The question of colour blindness, he said, which, when first described ninety years ago, had only the interest of a scientific curiosity, has become one of very great importance in our age of ocean and railroad racing. Colour blindness in its typical form is congenital, and with the very rarest exception, is double-sided; it is either red-green blindness or blue-yellow blindness, or total colour blindness. As red-green blindness is the usual and most important form, we will consider it exclusively here for simplicity's sake. The colour-blind individual “makes mistakes” in distinguishing certain colours. To him the ripe strawberry and its leaves, the blossom of the pomegranate tree and its foliage, the blush on a rosy cheek and the sky, are three pairs of equal colours. The names given to certain colours by the sufferer may be right or wrong; they do not convey to him the correct notions. A keen perception of dark and light shades exists, and often leads to the correct naming of colours. Still, naming is utterly misleading as a rule. Holmgren has there-

fore modified Seebeck's mode of testing by placing a bundle of coloured skeins before the colour blind, who has to select to a given shade all those which match. If there be two different colours which appear absolutely alike to the colour blind, a pattern made of these two colours will appear as of one colour only. On this principle Stilling based his plates, an excellent idea, which, however, fails very often; the reasons will be seen soon. The author calls two such apparently identical but different fundamental colours "twin colours." Such colours are, for instance, a certain yellow and green. To these two we may find a third fundamental colour, equally identical to the colour blind, a certain red, thus forming with the two others a set of "triplet-colours." He now found that while a certain green and yellow were twin colours for all his colour-blind patients, the corresponding red was right for some, too dark for others, too light for others again. This he found was due to the way in which the different eyes perceived the spectrum. If the red end of the spectrum was shortened, certain reds appeared darker than to eyes with a normal extension of the spectrum. Dr. Grossmann utilised this by embroidering letters of three colours so as to form on a brownish ground a red letter, say an F, completing it by green in such a manner as to form a B. A red-green-blind eye with normal spectrum will then see a blank ground, while one with a shortened spectrum sees the letter F dark on a lighter ground. Another difficulty is the variability of the daylight, which affects the different colours in twin combinations to a different degree. Both these reasons explain why Stilling's plates so often fail. The wool letters, though very nice, handy, and without glass, are very apt to fade. In order to get a more uniform light, and also to more readily imitate the signal lights, patterns were formed of twin-coloured glass, cut into small squares and arranged into mosaic figures, between two plain glasses, so as to form a slide, which is put into a lantern. These slides are not subject to the variability of daylight, and will never fade. The little squares are hardly destructible.

## ARCHITECTURE OF WELLS CATHEDRAL.\*

By CANON CHURCH.

IF Professor Willis had made a study of the earlier documents in our archives, and if he had published his own account of the fabric, there would have been little more to say of Wells Cathedral. But he does not make any direct quotation from documents earlier than 1286, and the reports of his several lectures on the church in 1851 and 1863 are often so contradictory as to be hard to understand. For the early history we have hitherto had no other authority than Godwin, and the Canon of Wells in Wharton's "Anglia Sacra." According to these writers there is a blank in the history of the church between Bishop Robert, by whom the church was consecrated in 1148, and Bishop Jocelin, whose episcopate extended from 1206-1242. Godwin describes the church to which Bishop Jocelin succeeded "as ready to fall notwithstanding the great cost bestowed on it by Bishop Robert;" he says "he pulled down the greatest part of it, to witte, the west ende and built it anew from the very foundation." No mention is made of any work or of any worker on the fabric between the time of Bishops Robert and Jocelin. But it is highly improbable, in the first place, that there should have been this blank of forty or fifty years in this active period in the history of the church, or that the church should have been allowed to fall into ruins during the episcopate of Bishop Reginald, successor to Bishop Robert. Reginald de Bohun, a Norman, called also "the Lombard" from some Italian connection, was a great man with his master Henry II., was employed in early life in political embassies, and took part in all the chief councils of the reign; he had seen men and cities and churches in an age of building. Consecrated in 1174, on his way home from Rome in company with Archbishop Richard, the successor of St. Thomas at Canterbury, his first act was to induce Hugh of Burgundy, afterwards St. Hugh of Lincoln, to leave his cell in the Grande Chartreuse to become prior of the first house of the Carthusians in England, at Witham, in his own diocese of Bath; his next to consecrate a church to the newly-canonised St. Thomas the Martyr, in his uncle's diocese at St. Lo, which in its desecrated state still contains features of its semi-Norman architecture. Crossing into England with Archbishop Richard, the two arrived at Canterbury on September 4, 1174, the day before the great fire which laid in ashes the choir of Canterbury Cathedral. The rebuilding of Canterbury under William of Sens and William the Englishman was going on during his frequent visits to Canterbury, and he himself succeeded to the see of Canterbury in 1191. During his episcopate building was going on actively in his own diocese, at Witham, in the rise of St. Hugh's Church and Friary—at Bath, where he

restored two churches and founded the hospital of St. John—at Glastonbury, where he consecrated the newly-built western lady chapel in 1187. It is not probable that this active-minded bishop, who was following the footsteps of his predecessors in making Wells the centre of the diocese, and in building up the constitution of his church of secular canons by the addition of fifteen new prebends, and by the increased endowment of the canons, should have allowed the fabric of his church to fall into ruins.

On the other hand, we have positive documentary evidence that he was zealously promoting the building of the church, and that the church was rising in his time. In a charter of early date, attested by Richard, the dean, the precentor, and "almost all the canons" of the church, he expressly recognises his duty as bishop to provide "that the honour due to God should not be tarnished by the squalor of His house," and so in full chapter and with the assent and counsel of his archdeacons, he makes a grant in support of the fabric, until the work be finished, of the proceeds of all benefices in the diocese so long as they shall be vacant. This grant formed at once a large "fabric fund," at that time amounting on an average to an equivalent of several hundred pounds of our money. It was an act of great munificence, and supplied a precedent to Bishop Jocelin and to later bishops, and was appealed to by the chapter when Bishop Roger in 1245 and Bishop John of Drogheda, asserted their claims and sought to appropriate these sequestrations for their own use. Following this charter of Reginald's grant of a fabric fund, there are charters of gifts from individuals towards the church, which contain evidence that the church was being endowed and the fabric was being built. One charter there is which it is very pleasant for a canon of Wells to read, in which Nicolas of Barrow, in *ruidecanal* chapter of Castle Cary ("in capitulo apud Kari"), "in consideration of the good conversation of the canons of Wells" ("considerata canonicorum Wellensium honesta conversatione") and of the admirable structure of the rising church ("et surgentis ecclesie laudabili structura"), gives up his life interest in the temporalities of the church of Lovington, of which the advowson had been given before to the church of St. Andrew by the Lord of Lovington, Robert de Kari. So then the church of St. Andrew was rising and becoming an object of admiration, and drawing forth gifts from individuals in the time of Reginald. There is another charter, which is dated "in the second year after the coronation of our lord the king at Winchester," most probably the second coronation of Richard I., after his return from captivity in 1194. If so, it will belong to the third or fourth year of Savaric, successor to Reginald. In this charter Martin of Carscumbe (Croscombe) gives three silver marks towards the construction of the new work of the church of St. Andrew, and two marks towards the repair of the chapel of St. Mary therein, "ad constructionem novi operis . . . et ad emendationem capellae beatae Mariae ejusdem loci." So from these documents we know from Reginald's own words and acts that the support of the fabric was the object of his care and munificence; we know that in his time the church was rising and becoming a goodly structure; we know that new work and repair of a lady chapel was being planned or carried out, to which offerings were made in the first years of his successor's episcopate, and we may safely conclude that the church was not neglected and falling into ruin, but that building was going on between 1174-1196. This evidence is sufficient to show that the Canon of Wells and Godwin, who make no mention of Reginald, are not to be considered ultimate authorities in this portion of the history of the fabric. I do not enter into the architectural puzzles of the building, or attempt to discriminate what parts belong to Bishop Reginald in the twelfth century, what to Bishop Jocelin in the thirteenth. But I will ask you to remember this evidence bearing upon the fabric history of the latter part of the twelfth century, and of Bishop Reginald's time, when you look upon nave and transepts and the western arches of choir, which, as Professor Willis has said, bear an architectural character "unlike that of any ordinary Early English building," "only a little removed from the Early Norman style," which Britton says there could be little hesitation in ascribing to the reign of Henry II., 1154-1189, on architectural evidence.

I pass on to the documentary history of the fabric during Bishop Jocelin's time—1206-1242. It is disappointing that there is so little. The documents are altogether silent about the fabric after 1196, during the years of Savaric's wandering and litigious life, and the early years of Jocelin's episcopate down to 1219-20. Within that time Jocelin was being carried away into the current of political strife, himself an exile, and the property of the See confiscated (200*l.* a year, equivalent to not less than 4,000*l.* to 5,000*l.*), paid yearly into King John's hands. After his return in 1213 he was engaged in the civil war and in the suit with Glastonbury. One grant there is, during the time of Dean Ralph of Lechdale, 1217-1220, in which a canon of Henstridge gives land and money, with the wish expressed that by his help the work may rise the more quickly. "Ut fabrica celerius ad optatam consummationem

\* From a paper read at the meeting of the Somerset Archaeological Society at Wells.

mea sedulitate consurgat." This is the only charter in our documents of a grant to the fabric during Jocelin's time. This charter shows that the work had recommenced at that date (1220). It appears that the prebends had been assessed for the fabric, and in this case a voluntary offering is made over and above the assessment to hasten the work. Outside our documents, there are other evidences of building operations. The Close Rolls of Henry III. contain grants to the fabric in 1220 of sixty large oaks (*grossa robora*) from the forest of Cheddar; in 1224 of one penny a day, remitted from the rent of Congresbury Manor; in 1225, of five marks annually for twelve years; in 1226, of thirty oaks, and of smaller wood (*frusta*) to repair the bishop's houses at Wookey. But no mention is made of these grants in the Chapter documents.

While there is detailed evidence of the gifts of houses for the permanent residence of the canons, and for the schools of the church, no more is said about the growth of the fabric until the statement in a charter of Bishop Jocelin of the completion and dedication of the church on the day of St. Romanus—October 23, 1239. The date of this event is fixed by the charter of the grant of the manor of Winscombe to the canons, dated "on the morrow of St. Romanus, the day of the dedication of the church in honour of St. Andrew, the gentlest of the Apostles, *Apostolorum mitissimi*." No further detail is given of the dedication, no description of the parts then finished and consecrated. But three years after, in the year 1242 (on November 19), about a month before his death, Jocelin makes a concise statement of the building begun, continued, and completed by him. He speaks only in general terms in the preamble of a charter, in which he is making ample provision for the endowment of all the members of the cathedral staff, as a duty no less binding than the support of the fabric. He records what he had done for the fabric of the church, which he says he found dangerous by reason of age ("periculum ruinæ patiebatur pro sua vetustate"). He had built, enlarged, and consecrated ("ædificare cœpimus et ampliare . . . in qua adeo profecimus . . . quod ipsam consecravimus"). Then he goes on to say that the common revenues of the ministers of the church had hitherto been scanty ("tenuis et insufficiens"), and to make the arrangements for their permanent augmentation. With no other authority than these words of the preamble to Bishop Jocelin's charter of increased endowment of the cathedral staff, the Canon of Wells, writing in vague language in Bishop Bubwith's time, that is, 180 years later, says that Jocelin had pulled down and rebuilt the church, from pavement to vault.

Bishop Godwin (1616) affects more precision in his statement. "The church of Wells being now ready to fall to the ground, notwithstanding the great cost bestowed upon it by Robert, he (Jocelin) pulled down the greatest part of it, to witte, all the west ende, built it anew from the very foundation, and hallowed or dedicated it October 23, 1239." So Professor Willis has assumed, on Godwin's authority, that "Jocelin himself asserts in one of his statutes that he pulled down the church and rebuilt it." Do Jocelin's words in this charter justify this assumption? They certainly do not to my mind—not even as read by themselves, much less when read in connection with Bishop Reginald's words and acts, and with the history of the time intervening between Reginald and the completion and consecration of the church by Jocelin in 1239-42. The words themselves occurring in the preamble to a charter relating mainly to another subject, the better endowment of the church yet remaining to be done, are general, not precise, in their review of what has been done. As it seems to me the words do not necessarily demand a more definite meaning than that, having begun, he had brought to an end the work he had undertaken, in the repair and enlargement of his church, which he found unfinished, old and ruinous in parts, and suffering from neglect and dilapidations of time. Reconsecration was necessary from the changes and additions which had been made both by Reginald and Jocelin since Bishop Robert's consecration, nearly one hundred years before, in 1148; and it was enforced at this time by the orders of the Papal legate, according to which several other churches were consecrated about the same time. The state of dilapidation and partial ruin in which Jocelin says he found the church might well have been the effects of some twenty or thirty years of neglect of an unfinished building, in such times, under the wasteful episcopate of Savaric, the confiscations of King John, the civil war, the intolerable exactions of Papal legates, and the local quarrels with the great rival power at Glastonbury going on to 1218-19. But we must not detract from Bishop Jocelin's greatness. If contemporary documents do not justify the statements of Godwin, nor the general tradition that Jocelin did everything at Wells—that he pulled down and rebuilt the whole church—yet there is sufficient evidence that he did very much, quite sufficient to justify the tradition that he was in a true sense "the maker" of Wells. He and his brother Hugh, afterwards of Lincoln, were "men of the soil," of Launcheley, of Wells, "wholly Wells" (as Godwin says), living through Reginald's episcopate, Hugh as archdeacon, Jocelin canon of Wells, rising to honour as judges, and becoming by office and royal grant

possessed of riches, manors, and benefices. Hugh gave largely of his great wealth to his brother Jocelin for the church, and Jocelin gave all that he had to "the church he loved so well, in which he had been nourished from his infancy," where, as his fellow-canons attested before his election, "he had lived in all good conscience among them hitherto."

Thus the two brothers, in a spirit of local patriotism and pious devotion, which will compare with that of Florentine citizens and builders of Italian towns, became the makers of their native town. The Registers bear witness that after his return from exile Jocelin was working steadily through troublous times to build up the constitution of his church of secular canons at Wells, on the lines of his predecessors, Reginald and Robert—increasing the prebends, remodelling the offices, giving full and definite duties and additional endowments to every member of the staff of the church, providing hospital, schools, houses for the resident canons, making and stocking his park at Wells, building and repairing houses and a chapel at Wookey. He was not the creator, but the remodeller, legislator, and finisher of the constitution. So as builder of the fabric he continued and finished the work of his predecessors, repairing and rebuilding what was dilapidated or unfinished, adding largely new and original work, and when sufficiently completed in interior arrangements and endowment he consecrated his finished work shortly before his death.

Professor Willis has told us that the date of the consecration of the church by Jocelin in 1239 agrees "with that phase of Early English work which the architecture of the west front presents," and that the west front "is built in the fully-developed Early English style in which Salisbury is built." We know that Jocelin was a frequent visitor at Salisbury, while Bishop Poore was building. He was present at the consecration of the choir in 1225; he was one of the commissioners named by the Pope to pronounce on the merits of St. Osmund for canonisation in 1228. The architecture and contemporary evidence lead to the conclusion that the west front was Jocelin's special work while repairing and completing the unfinished nave of his predecessors. If this was so, it would have been a noble achievement for the last twenty years of a troubled episcopate. If he did this, and no more than this, it would not be difficult to imagine how the tradition would have grown that he was the builder of the whole church. Amidst the obscurity attaching to the early building in the troublous times of the twelfth century, Jocelin's fame as benefactor, legislator, builder of the west front, and the finisher of the church, would eclipse the fame of his predecessors, and invest him justly with the title of "the builder of church," "as if there had been none like him, nor would be after him." But with these documents before us, I claim that those who went before and prepared the way for Jocelin's achievements should not be forgotten.

"Vixere fortes ante Agamemnona." Jocelin is first and foremost, but Reginald de Bohun ought to hold the second place of honour between Robert and Jocelin as one of the "makers of Wells," one of the "first three" master builders of our holy and beautiful house of St. Andrew in Wells.

#### Oriental Architecture in England.

SIR,—In the *Times* of September 6, Mr. H. Devey Browne, of Eastbourne, questions my views (see *The Architect*, September 7) as to the advantages of English architects using externally certain coloured materials. If you will allow me, I will quote his words, and reply to them as I proceed. After admitting that I urge that we should adopt a *suitable style of architecture* to display the various coloured materials—granites, porphyries, quartz, and serpentines—found in this country, he says, "I would venture to suggest that the really good English architects before the eighteenth century were satisfied with the quiet colours of homely brick and stone." To this I would reply that, if they were, they would be quite satisfied with the subdued tones of the igneous rocks. The richest-coloured red granites or red elvans are mildness itself compared with ordinary red bricks, and though yellow quartz may be a little more brilliant than buff stone, the architect who is an artist, as every architect should be, will know how to use it so that it shall harmonise the green and purple tints of the porphyries and serpentines, which again could be subdued by the black basalt of Cree Hill or developed by the white quartz of North Cornwall or the white elvan of Okehampton. Then Mr. Browne asks, "Does Mr. Travis think that the modern architect, with all the colours of the rainbow at his command, could design anything as good as the erections of our ancestors?" To this I say that, having the benefit of all that has been done in the past, together with the aid of modern science, he ought to be able to surpass his ancestors in the art of architectural

design; but that he will do so I have my doubts, like Mr. Browne, because he has such an inveterate habit of copying ancient work suitable to past times, instead of basing his designs upon modern requirements and taking advantage of the wider field in the choice of materials which modern science has placed at his command. His ancestors did this as far as it was in their power, and it is as certain as anything can be that, if living at the present day, they would do what I have ventured to suggest, viz. use the igneous rocks in external architectural construction, both on account of their innate beauty and their absolute durability in the noxious atmosphere of the metropolis and other large towns. Then Mr. Browne asks, "Will not Nature give a delicacy of colour on lichen wall and mossy roof, which is far more picturesque than the hard, smooth, unchanging colours of marble and granite?" Here I may say that I admire the colours with which Nature invests everything when she is not interfered with as much as Mr. Browne, but my proposal applies solely to city architecture, and that I think it is only necessary for any one to stand in front of the Crimean monument in Westminster, or other granite structure, to be convinced of the value of these materials in the construction of town buildings. Twenty years have passed since its erection, and the granite shaft is as perfect as when the workmen departed. Not so the freestone work, which is a fuliginous mass of scarcely distinguishable detail. Within a bow shot he will also see the Houses of Parliament, on the restoration of the stone of which 2,500*l.* are annually spent. Such an edifice could now—in this age of science—be erected of porphyry, quartz, and granite, that would not only cost nothing extra, and not cost a farthing in repairs, but would remain unchanged in the sooty atmosphere of London. If ancient examples be asked for they are sufficiently numerous. Of course there could be no elaborate tracery, but only simple splays—no florid carving, but only mosaic work; but as compensation there would be equal beauty of outline, a surface of unfailing burnished texture, and an everlasting glow of colour which, in my opinion, is a very essential element of design in a cold and grey climate like our own, though some writers on this subject seem to forget that contrast in art is as important and necessary as harmony. Finally, having answered most of Mr. Browne's questions, I may fairly ask him one. Is he aware that all the architecture of the West originated in the East? Apologising for the length of my remarks,—I am, sir, yours truly,

HENRY TRAVIS.

The Limes, Streatham : September 11.

#### Theatre Exits and Fire Risks.

SIR,—Your correspondent, Mr. Macpherson, has made a practical and valuable suggestion in pointing out that the mere existence of a fireproof screen or curtain, however perfect it may be, would not suffice to prevent panic unless it be lowered between each act, thus familiarising the public with the fact that the auditorium can be completely shut off from the stage at a minute's notice in case of fire. As this correspondence is likely to be read by a very large number of people, I think it would be extremely useful if the inventor of the new fireproof curtain would explain, in your next number, as lucidly as possible, his reasons for claiming his curtain to be perfectly fire-resisting. If I may venture to make one more request, I should like some of your correspondents to suggest means by which audiences could leave places of amusement in event of a scare without running the great risks they at present do.—Yours truly,

E. YEOMANS.

High Street, Aston, Birmingham :  
September 12, 1888.

SIR,—Will you kindly insert the following remarks in your next publication respecting fire in theatres? I cannot refrain from expressing my hearty concurrence with Mr. Macpherson's letter in your last week's issue, with reference to thoroughly instructing theatre-goers as to what is being done to protect their lives in case of fire. No doubt you and your correspondents are already doing some good in drawing attention to the steps which might be, and in some cases have been, taken to render theatres fireproof, and the discussion raised in your columns may eventually induce theatre managers to take a *bond-fide* interest in demonstrating to their audiences that fire risk has been so minimised, that there remains no practical danger of a fire spreading from the stage to the auditorium. When theatres have been burnt down from time to time, and vast numbers of persons sacrificed, an active discussion has generally ensued as to how a recurrence of such disasters can be avoided, but the popular excitement rapidly subsides, and the public once more relapses into a state of composure, leaving the question of life and death to the solution of theatrical managers and architects.

As a plain matter of fact, theatres can, without difficulty and with absolutely less cost than under the present faulty

system, be rendered absolutely fireproof. Of course the architectural mind is averse to own that the existing system has proved a deadly failure, and hence it becomes the duty of the theatre-going public to so agitate this vital question, as to ultimately make it compulsory on theatrical architects and managers to adopt the means at their disposal for constructing theatres which shall be actually fireproof, without, of course, disturbing the laws of acoustics.

While due consideration must be given to the results of any possible panic, every modern improvement should be made use of to prevent the fire from spreading from the stage to the auditorium, and above all to prevent panic by keeping the audience in ignorance that any fire exists. The obvious way to do this is by instantly shutting or lowering an impenetrable screen or curtain similar to that suggested by one of your recent correspondents, and which seems to me from the material employed in its construction to be well adapted for the purpose, as there can be no doubt that silicate cotton is not only incombustible, but a perfect resistant of heat, however intense it may be.—Yours faithfully,

R. MACGREGOR.

149 Grange Road, Birkenhead : September 12, 1888.

SIR,—The recent letters in your issues of the 17th, 24th, and 31st ult. on the above subject imply a misapprehension of the manner of constructing an iron-framed asbestos cloth fireproof curtain, as practised by this company. May I count on your courtesy to insert the following few remarks in refutation of the prevalent misconceptions on this subject?

We continue to maintain that a single curtain fixed on a roller is useless in preventing the spread of fire, as the weight of the roller would not suffice to keep the curtain from bellying, as happened at the Exeter Theatre, nor to prevent the flames and smoke from entering the auditorium; nor would we by any means recommend a single curtain on an iron frame, as in such a construction the ironwork would be exposed to direct contact with the flames, and an unequal expansion would take place, resulting in the buckling or twisting of the framework.

The form of curtain which we recommend is the double asbestos metallic cloth curtain, on an iron frame, with an air-space between the two cloths. Although the floss asbestos usually used with gas stoves instantaneously becomes incandescent when brought into contact with flame, this is not the case when asbestos of the kind employed for curtains is converted into a textile fabric. A practical proof of this was afforded by the action of the committee of justices appointed by the Birmingham magistrates to consider the provisions necessary for the protection of the public against fire in the theatres and music halls in that borough. In the report of this committee, read at the annual meeting of the magistrates on January 4, 1888, Mr. Jaffray stated:—"Your committee caused a piece of the material of which the asbestos curtain is made to be placed over, but close to, the flames of several gas-jets for about half an hour. At the end of that time there was no trace of burning, nor was the material made very hot. It appeared to your committee that it was not only fireproof but smokeproof, and the curtain when down would completely prevent the audience seeing any smoke or fire on the stage, and would, therefore, to a considerable extent prevent panic." In moving the adoption of the report, Mr. Jaffray said:—"They directed their attention specially to the cutting off of the stage from the auditorium. . . . The means Mr. Simpson had very thoughtfully taken at the Theatre Royal for cutting off entirely the stage from the auditorium would prove effectual. He had provided an asbestos curtain . . . and the committee were convinced that it would successfully resist intense heat for such a length of time as would enable a large audience to escape." The low conductivity of spun and woven asbestos, therefore, affords, in our opinion, a guarantee against such an increase of temperature in the ironwork as to cause it to buckle or twist before the audience had ample time to get out. The statement as to incandescence is also disposed of by this report; but supposing, for argument's sake, that such an intense heat were generated on the stage as to cause the asbestos cloth on that side to become incandescent, it would still be impervious to flame, and the air-space between the two cloths would effectually prevent any abnormal development of heat on the side next the auditorium. Another simple and effective preventive of incandescence, the adoption of which we strongly recommend, is a row of automatic sprinklers at the top of the curtain, which, in the event of fire, would keep the cloth thoroughly wet. These curtains can be lowered in ten seconds or less, and would confine the fire solely to the stage. The audience would be enabled to quit the theatre without panic, which is the cause of more injury and loss of life than actual fire; and the usual means of extinction—sprinklers, hydrants, &c.—could be manipulated without hindrance. Should, however, the iron framework be objected to, another method of construction (Marius's patent) can be adopted, by which the curtain (double with an air-space) can be run up in folds and rapidly lowered.

Prevention, doubtless, is better than cure, and if all stage

appliances were coated with asbestos fireproof paint, there would be no danger of any material so treated catching fire; but it is always the unforeseen which happens, and even with the most careful supervision, there might come a time when some inflammable material in use might ignite, and it is beyond doubt that the advantage of the asbestos fireproof curtain would then be recognised.—Your obedient servant,

J. ALFRED FISHER, Manager and Secretary,  
The United Asbestos Company, Limited.

### SCHOOL BUILDINGS.

**Brierley Hill.**—The new schools at Mount Pleasant, Quarry Bank, for the Kingswinford School Board, were opened on Monday last. They have been erected from the designs of Messrs. G. B. Nichols & Son, architects, Colmore Row, Birmingham, by Messrs. H. Dorset & Son, builders, Cradley Heath. The buildings are planned for the accommodation of 360 children, viz. 234 mixed and 126 infants, each having separate entrances in connection with cloakrooms and lavatories. The mixed school is 65 feet by 20 feet, with two classrooms, each 24 feet 8 inches square and teachers' room. The infants' schoolroom is 30 feet by 22 feet, with classroom 22 feet by 20 feet and teachers' room. The materials used are red brick relieved with moulded and other bricks. In the gables at each end of the schools is the Board's monogram, and occupying the central position is the stone bearing the date of the erection of the schools. The roof of the buildings is slated, the ridges being finished with red ornamental crest tiles and terra-cotta finials, and over the girls' and infants' entrance is a bell turret, 48 feet high, with lightning-conductor fixed by Mr. J. Blackburn, of Nottingham. In the schoolrooms and classrooms is a dado of wood, 4 feet high, stained and varnished. The porches and passages have a dado of white glazed bricks, and the floors are paved with red and blue Staffordshire quarries. The whole of the rooms are partly open, the ceilings boarded, stained and varnished, and are well lighted with large windows, the upper parts of which are filled with Leggett's casement adjusters. The floors are laid with wood-block paving. Boyle's inlet ventilators are used, and there are also outlet ventilating turrets in the roof. The schools are heated throughout by hot-water apparatus supplied by Mr. J. Attwood, engineer, of Stourbridge. The lavatory fittings are of Macfarlane's manufacture.

**Cheetham.**—The memorial-stone of a new school which is being built by the Manchester School Board, in Waterloo Road, to accommodate the children at present attending the temporary schools at Salem chapel and the Congregational church, in Bury New Road, has been laid. In these schools there are at present about 750 children, but the new premises will accommodate over 1,000. They are to cost about 13,250*l.*, and are being erected by Messrs. R. Neill & Sons, from plans prepared by Mr. H. Lord, architect.

**Glasgow.**—The Roman Catholic school built on the west side of Sandyfauld's Street has been opened. The building is a handsome and substantial structure, designed by Messrs. Pugin & Pugin, of Westminster. Red sandstone, with rock facing, is used for the front of the building, and vitrified bricks are the material put into the gables and back portions of the erection. All the latest School Board improvements are taken advantage of in the fitting-up of the interior of the three storeys of which the building consists, and the lighting and ventilation are on the most approved methods. The contract price for the building was 5,000*l.* The school will accommodate 1,300 children.

**St. Albans.**—The memorial-stone of the extensions to the Wesleyan Sunday school has been laid. The cost will be about 1,500*l.* The ventilation throughout has been amply provided for, and the vitiated air will be extracted by Boyle's patent extractor. The architect is Mr. James Weir, F.R.I.B.A., 9 Victoria Chambers, Westminster, and the contractors are Messrs. Chamberlain & Birrell, of St. Albans.

### CHURCH BUILDING AND RESTORATION.

**Grimsby.**—Plans are in preparation for a new memorial church, to seat 500 persons, for the parish of St. Andrew, Grimsby. The style of the work is Perpendicular, consisting of nave, north and south aisles, chancel, memorial morning chapel, organ chamber, western baptistery, and vestries. The materials to be used are red brick with stone dressings, the roofs being covered with Broseley tiles. The arms of the donor, together with the See of Lincoln, will be introduced in the gables of the western porch. Mr. E. W. Farebrother, F.R.I.B.A., Grimsby, is the architect.

**Kilmaurs, N.B.**—The parish church of Kilmaurs has been reopened after renovation. The works have been carried out from the designs of Mr. R. S. Ingram, architect, Kilmarnock,

the contractors being:—Masons, J. McLachlan & Sons, Irvine; joiner, David Wood, Kilmarnock; slater, Robert Millar, Stewarten; plumber, W. Murchland, Kilmarnock; glazier-work, A. & G. Gilchrist. The total cost of the rebuilding is about 1,500*l.*

**Lower Gornal.**—The foundation-stone of a chancel for the church of Lower Gornal has been laid. The plans of Mr. T. H. Fleeming, architect, Wolverhampton, were adopted, and the tender of Messrs. Holland, of Dudley, to execute the work was accepted.

### GENERAL.

**Sir John Gilbert** has resigned the presidency of the Royal Water-Colour Society.

**The Exhibition of Pictures** at the Wolverhampton Art Gallery is to be opened on the 25th inst.

**The Architectural Association**, by leave of the Marquis of Salisbury, paid a visit on Saturday to Hatfield House, when Mr. J. A. Gotch, the past president, described the history and chief features of the building.

**The First Exhibition** of the South Wales Art Society and Sketching Club will be opened in Cardiff to-morrow (Saturday).

**MM. Trélat and Vaudremer**, the French architects, have been appointed members of the organising committee of the International Sanitary Congress, which will be held next year in Paris.

**The Plans** of Mr. Leonard Stokes for a Roman Catholic church to be erected in Guildhall Street, Folkestone, have been approved of by the Corporation.

**A Committee** has been appointed to obtain a site for a proposed United Presbyterian church in Dundee.

**Mr. G. C. Dewhurst** has promised the sum of 1,000*l.* towards the rebuilding of Lymm parish church tower, which is to be carried out under the direction of Mr. Crowther.

**The Leith Dean of Guild Court** on Monday granted a warrant for the erection of a theatre in the Kirkgate. The plans show accommodation for about 1,000 persons.

**The Coventry City Council** on Tuesday acceded to a request from the South Kensington Museum authorities, asking for the loan of one of the Coventry maces of the date of Charles II., to reproduce it by electrotyping for exhibition in the museum and affiliated institutions, as an addition to the collection of corporation and university plate.

**Plans** have been prepared for laying out eleven acres of land belonging to the town of Hyde, Manchester, as a cemetery. The estimate of Mr. Beaumont, the architect, is 6,051*l.*, of which 1,556*l.* is for a chapel and 800*l.* for a lodge.

**The Municipal Council** of Copenhagen have voted 50,000*l.* for the construction of municipal buildings.

**A New Vicarage House** in connection with the church of St. Leonards is to be built at Thornton-le-Street, near Thirsk.

**A Canal** is proposed to be constructed to connect the Black and Caspian seas. A sum of 40 millions of roubles is estimated to be required for the work.

**The Metropolitan Board of Works** closed Lambeth Bridge on Saturday last, the day of a regatta, owing to its dangerous condition.

**The Dean and Chapter of Lincoln** are about to restore the chapter-house of Lincoln Cathedral. The cost is estimated at about 7,000*l.*

**Plans** by Mr. E. W. Farebrother, F.R.I.B.A., of Grimsby, for new schools for 1,000 children, arranged on the central hall system, were approved by the Cleve-with-Weelsby School Board on Wednesday, the 5th inst.

**Healing Manor**, N. Lincolnshire, is now being remodelled from the designs and under the superintendence of Mr. E. W. Farebrother, F.R.I.B.A., architect, of Grimsby.

**Mr. Donald Robertson**, formerly master of Smith Street Branch School of Art, Birmingham, has been appointed head-master of the Walsall School of Art.

**The Governors** of the York County Hospital on Monday decided that plans which have been prepared for additional rooms to be erected over the Watt Ward should be carried out. In 1874 the late Mr. Richard Watt, of Bishop Burton, left a legacy of 4,500*l.* for the building of a new ward, which has been completed at a cost of 3,800*l.*, and the residue of the bequest, with accumulated interest amounting to over 1,000*l.*, leaves a sufficient sum to cover the cost of the proposed additions.

**CRIMINAL PROCEEDINGS**, under the new Merchandise Act, will be instituted against any person falsely representing any form of ventilator to be a Self-acting Air-pump Ventilator, said title being registered and our Trade-Mark, applicable only to ventilators manufactured by us. Any infringement renders the person infringing liable to two years' imprisonment. ROBERT BOYLE & SON, LD.

### COMPETITION OPEN.

GORTON.—Sept. 15.—Designs are Invited for Public Baths. Mr. R. T. Holland, Clerk to the Local Board, Local Board Offices, Gorton.

### CONTRACTS OPEN.

APPERLEY BRIDGE.—Sept. 15.—For Building Mill, Shed, Engine-house, Boiler-house, and Chimney. Messrs. J. Kendall & J. H. Bakes, Architects, Idle.

BELFAST.—Sept. 17.—For Proposed Sheds for the Belfast Rope Works Company, Limited. Mr. R. Watt, architect, 77A Victoria Street, Belfast.

BELFAST.—Sept. 24.—For Building Tower and Spire to Catholic Church, Holyrood. Mr. M. H. Thomson, Architect, 65 Upper Arthur Street, Belfast.

BIDEFORD.—Sept. 21.—For Widening Quay. Mr. Henry Chowins, Borough Surveyor, Bideford.

BOURNEMOUTH.—Sept. 18.—For Enlargement of the East Cliff Congregational Church and Schools. Messrs. Lawson & Donkin, Architects, Beckford Buildings, Bournemouth.

BRADFORD.—Sept. 18.—For Building Hide, Skin, and Tallow Auction Mart, with Dwelling-house, Offices, and other Buildings. Mr. G. C. Gamble, Architect, 225 Leeds Road, Bradford.

BRISTOL.—Sept. 15.—For Additions to Premises, Wine Street, for Messrs. Belfield & Sons, also for Mr. W. B. Biggs. Mr. Henry Williams, Architect, 28 Clare Street, Bristol.

CARDIFF.—Sept. 14.—For Building Sunday School and Cottage. Mr. E. M. B. Vaughan, Architect, 20 St. Mary Street Cardiff.

CHESLYN HAY.—Sept. 15.—For Building New Schools. Mr. W. Wood, Architect, Longton.

CROUCH END.—Sept. 18.—For Building two Residences for Mr. C. A. Mackness. Mr. S. W. Brooking, Architect, 44 Finsbury Circus, E.C.

DENT.—Sept. 15.—For Restoring Church. Mr. W. Wright, Surveyor, Lancaster.

DEWSBURY.—Sept. 19.—For Building Organ Chamber and Choir Vestry, St. Matthew's Church. Messrs. Holtom & Fox, Architects, Westgate, Dewsbury.

DUBLIN.—Sept. 25.—For Construction of Four Iron Street Bridges. Mr. E. Maunsell, Secretary, Westland Row Terminus, Dublin.

EXNING.—Sept. 17.—For Building Cottage Hospital, Boundary Walls, &c. Mr. Thomas Ennion, Deva Chambers, Newmarket.

FARSLEY.—Sept. 21.—For Building Stockrooms, Offices, &c. Mr. C. S. Nelson, Architect, Albert Chambers, Park Row, Leeds.

FINSBURY PARK.—Oct. 2.—For Building Store Shed. The Superintending Architect, Metropolitan Board of Works, Spring Gardens.

FULHAM.—Sept. 19.—For Building Stables for Fifty Horses, with House and Office. Mr. C. J. Foakes, Clerk to the Vestry, Walham Green, S.W.

GREAT YARMOUTH.—Sept. 19.—For Additions to Board School. Messrs. Bottle & Olley, Architects, Regent Street, Great Yarmouth.

HEATON.—Sept. 15.—For Building Pair of Villas. Mr. Herbert Isitt, Architect, Sunbridge Row, Bradford.

HUDDERSFIELD.—Sept. 20.—For Building Shops and Nine Dwelling-houses. Messrs. John Kirk & Sons, Architects, Huddersfield.

LONDON.—Sept. 20.—For Enlargement and Erection of Board Schools, &c. The Architect's Department, School Board Offices, Victoria Embankment.

LONDON.—Sept. 18.—For Bakehouse and Stable, for the Battersea and Wandsworth Co-operative Society. Mr. T. E. Webb, Secretary, 2 Plough Road, S.W.

LONGTON, STAFFS.—Sept. 15.—For Building two Houses near Clayton Street. Mr. W. Wood, Architect, Longton.

LOWER FITTLEWORTH.—Sept. 14.—For Building House. Mr. William Buck, Architect, Horsham.

NEWBURY.—For Repairs to Corn Exchange. The Borough Surveyor, Newbury.

NOTTINGHAM.—For Additions, &c., to Villa Residence Sherwood Rise. Mr. H. Sulley, Architect, Wheeler Gate, Nottingham.

OTLEY.—Sept. 19.—For Building Workshop. Mr. Arthu Longfield, Silver Mills, Otley.

RHEWL, MOSTYN.—Sept. 14.—For carrying out Works for Water Supply. Mr. J. L. Williams, Sanitary Inspector, Brynford, Holywell.

SALCOMBE.—Sept. 22.—For Building Chancel and Porches to Church. Mr. J. May, Courtenay Street, Salcombe.

TUNBRIDGE WELLS.—Sept. 15.—For Building Pair of Semi-detached Houses and Three Detached Houses, Moun Ephraim. Mr. Wm. B. Hughes, Architect, 43 London Road Tunbridge Wells.

WEYMOUTH.—Sept. 19.—For Harbour Improvement Works Quay Wall, Landing Jetties, Retaining Wall, Sea Wall, Diversion of Esplanade, Toll-house, Entrance Gates, Shelters, &c.

\* Names and addresses to be forwarded not later than date.

Mr. W. Barlow Morgan, Borough Surveyor, New Street, Melcombe Regis.

WICKERIDGE.—Sept. 20.—For Building Pair of Semi-detached Cottages. Mr. W. Barrons, Weir View, Totnes.

WIGAN.—Sept. 19.—For Sanatorium Buildings. The Borough Engineer, Wigan.

WOLVERHAMPTON.—Sept. 20.—For Enlarging Instrument-room at Post Office. The Postmaster, Wolverhampton.

YEADON.—Sept. 20.—For Building Villa. Mr. George Foggitt, Architect, Yeadon.

YORK.—Sept. 18.—For Billiard-room. Mr. James A. Green, Hon. Secretary, Fulford District Conservative Club, York.

## CONTRACTORS TO H.M. GOVERNMENT.

INTERNATIONAL HEALTH AND OTHER EXHIBITIONS—MEDALS AWARDED FOR

# LEGGOTT'S PATENT ADJUSTMENT

CONTINUOUS OPENER.

SILENS.

THE SILENS, for Fanlights, Skylights, &c. Is admitted to be the best ever put before the Public. Can be adapted to any kind of window. Size and height of window no object.

From 4/3 each.

The WILMOS is worked with a rod or endless cord. It is extremely neat, and can be fixed to open either top or bottom, inwards or outwards; no cutting away of frame required. When worked with a rod is most efficient for Public Buildings, as the key can be loose. For Price Lists Illustrations, and Testimonials, write as below.

For Continuous and other Lights, Estimates given.

WILMOS.

NO CUTTING AWAY OF FRAME REQUIRED.

#### TESTIMONIAL.

SIRS,—I have pleasure in testifying that I have used Leggott's Silens Adjustments for various buildings to high skylights, fanlights, and top parts of windows, and in every case they gave satisfaction. They are secure in whatever position, whether the window is open or closed, and are quite simple and workable in their action. I prefer them to any other that I have seen or used for the above-mentioned purposes.

Messrs. W. & R. LEGGOTT, Bradford.

I remain, yours obediently,

R. DAVIES, Architect.

BANGOR: N. Wales: Sept. 14, 1885.

Considerably Reduced Price List, November 1, 1887.  
ALL WORK ENTRUSTED TO US GUARANTEED SATISFACTORY.

## TRADE NOTES.

A COMPANY has, Consul Franz states, been started in Rome in order to promote the extraction and use of lignitis. It appears that this combustible is to be found in great abundance in Italy. The company own a mine at Murlo, off the Siena-Grosseto line, containing a layer measuring between 2-5 metres in width, which is estimated to yield no less than 1,000,000 tons of very good lignitis specially adapted for producing gas-heat. It is asserted that, having tested the Murlo lignitis in comparison with some of the best English coals, the calorific power obtained by the former was one-half, or nearly three-fifths, that derived from English coals, and that, while a ton of lignitis develops a smaller volume of gas than one of English coal, the gas produced by it possesses in an equal volume a higher heating power. By way of experiment, railway companies are using lignitis for railway engines.

At the monthly meeting of the Wolverhampton Town Council, on Monday, the report of a special committee on the question of supply of artificial light for the inhabitants was

submitted, which stated that the committee could not recommend the adoption of the electric light for the lighting of the streets alone, since such an experiment would not pay, but they were assured by local electric engineers that if the light were adopted for house lighting as well as street illumination it would be a thorough success, and give a good return on the capital invested. Further, they were assured that if a 40,000 lamp installation were entered into, the present price of gas could be successfully competed with.

MR. E. H. SHORLAND, of Manchester and London, has just supplied his patent Manchester grates to the Cheshire Lines Railway Committee for their new station at Heaton Mersey, near Stockport.

THE London Electric Supply Corporation are about to remove immediately to new and commodious offices at No. 3 Adelphi Terrace, Strand, their present offices at No. 79 Grosvenor Street being no longer sufficiently large for their rapidly-increasing business. The new central generating station of the Corporation at Deptford is rapidly approaching completion, and it is understood that the directors will be able to furnish a largely increased supply of the electric current before the close of the year.

THE contract for the erection of electrical controlling apparatus and signals in connection with the machinery in a new granary built by the Docks Committee of the Council of the City of Bristol, has been secured by Messrs. King, Mendham & Co., electrical engineers, of that city.

THE Edinburgh Town Council have approved of the Water of Leith Drainage Scheme, which it is estimated will cost between 50,000*l.* and 60,000*l.*

IN the new Queen's Theatre at Longton the fireproof floor, consisting of iron girders and solid concrete, has been laid by Mr. Roger Lowe, of Farnworth, Bolton.

AT the holding of the Labour Congress in Toronto, Canada, on Saturday, amongst others, resolutions were adopted asking the Dominion Parliament to pass a Bill to prohibit the importation of foreign labour under contract; demanding the abolition of the contract system in connection with national, provincial, and municipal works; and urging a radical change in the present patent laws.

MESSRS. WALKER, gas engineers, London, have contracted to construct the new gasometer for Perth Corporation Gasworks, at a cost of about 9,000*l.*

THE Standard Theatre will next month be put up for sale by auction by Sir J. Whittaker Ellis. The property, which is freehold, will be offered together with Bishopsgate Hall and other freehold premises which adjoin, in consequence of proceedings in Chancery.

THE prison authorities contemplate the erection of a new prison for Aberdeen and the district, the present building in Lodge Walk, to the rear of the Court-house buildings, being deemed unsuitable. The new prison will be designed to contain 100 cells.

THE late opening of the Baltic ports has had the effect of concentrating the timber trade of Grimsby into a short period. The Alexandra Dock is now filled with timber ships waiting to be discharged, and great difficulty is experienced in getting sufficient men to do the work, and several vessels have been unable to come to the port owing to the want of efficient labour to insure a quick discharge.

THE Lord Provost's Committee of Edinburgh Town Council have recommended the acceptance of an estimate for carrying out the proposed alterations upon the Edinburgh Police Chambers. The amount of the estimate is 2,288*l.*

THE ironmasters have advised the iron merchants of South Staffordshire of an advance of 5*s.* to 7*s.* 6*d.* and in some case of 10*s.* per ton, on the prices of ordinary merchant bars.

A NEW Bodega restaurant has been erected in Coleman Street, London, and special attention has been paid to the ventilation, Messrs. Robert Boyle & Son's latest improved self-acting air-pump ventilators being adopted for the extraction of the vitiated air.

THE Soap Works of Messrs. W. Taylor & Co, Broughton Road, Edinburgh, are to be reconstructed, the premises having been recently destroyed by fire.

#### UTILISATION OF ELECTRICITY.

IN the section of Mechanical Science at the Congress of the British Association in Bath, Mr. W. H. Preece read a paper on electricity. Having at the outset referred to the American philosopher, Franklin, who brought down atmospheric electricity by his kite string in 1747, he said even now, though commissions composed of the ablest men of the land have sat and reported on Franklin's work in England, France, and nearly every civilised nation, the public generally remains not only

ignorant of the use of lightning-conductors, but absolutely indifferent to their erection; and, if they are erected, certainly careless of their proper maintenance. I found in a church not very far from here the conductor leaded into a tombstone, and in a neighbouring cathedral the conductor only a few inches in the ground, so that I could draw it out with my hand. Although I called the attention of the proper authorities to the absolute danger of the state of affairs, they remained in the same condition for years. Wren's beautiful steeple in Fleet Street, St. Bride's, was well-nigh destroyed by lightning in 1764. A lightning-rod was fixed, but so imperfectly that it was again struck. In July last (1887) it was damaged because the conductor had been neglected, and had lost its efficiency. Lightning-conductors, if properly erected, duly maintained, and periodically inspected, are an absolute source of safety; but if erected by the village blacksmith, maintained by the economical churchwarden, and never inspected at all, a loud report will some day be heard, and the beautiful steeple will convert the churchyard into a new geological formation. The network of telegraph wires all over the country is peculiarly subject to the effects of atmospheric electricity, but we have completely mastered the vagaries of lightning discharges in our apparatus and cables. Accidents are now very few and far between. The art of transmitting intelligence to a distance beyond the reach of the ear and the eye, by the instantaneous effects of electricity, had been the dream of the philosopher for nearly a century, when in 1837 it was rendered a practical success by the commercial and far-sighted energy of Cooke, and the scientific knowledge and inventive genius of Wheatstone.

Having explained in detail the perfection with which electricity had been applied to the purposes of the telegraph and the telephone, and the important part these played in the present economy of the world, he said:—Electric lighting has become popular, not alone from the beauty of the light itself, but from its great hygienic qualities in maintaining the purity and coolness of the air we breathe. The electric light need not be more brilliant than gas, but it must be more healthy. It need not be cooler than a wax candle, but it must be brighter, steadier, and more pleasant to the eye. In fact, it can be rendered the most perfect artificial illuminant at our disposal, for it can illumine a room without being seen directly by the eye; it can be made absolutely steady and uniform without irritating the retina; it does not poison the air by carbonic acid and carbonic oxide, or dirty the decorations by depositing unconsumed carbon; it does not destroy books or articles of *virtu*

and art by forming water which absorbs sulphur acids; and it does not unduly heat the room. In the Post Office Central Savings Bank in London it has been found, after two years' experience of electric lighting, that the average amount of absences from illness has been diminished by about two days a year for each person on the staff. This is equivalent to a gain to the service of the time of about eight clerks in that department alone. Taking the cost at the overtime rate only, this would mean a saving in salaries of about 640*l.* a year. The cost of the installation of the electric light was 3,349*l.*, and the annual cost of working 700*l.* per annum—say a total annual cost of 1,034*l.* The cost of the gas consumed for lighting purposes was about 700*l.* a year, so that on the whole there was a direct saving of something like 266*l.* a year to the Government, besides the material advantage of the better work of the staff resulting from the improved atmospheric conditions under which their work is done. Though the electric light was discovered by Davy in 1810, it was not until 1844 that it was introduced into our scientific laboratories by Foucault; it was not until 1878 that Jablockhoff and Brush showed how to light up our streets effectually and practically; it was not until 1881 that Edison and Swan showed how our homes could be illuminated softly and perfectly. Unpreparedness for such a revolution produced a perfect panic among gas proprietors; inexperience in the use of powerful electric currents resulted in frequent failure and danger; speculation in financial bubbles transferred much gold from the pockets of the weak to the coffers of the unscrupulous; hasty legislation in 1882 restricted the operations of the cautious and the wise; and the prejudice arising from all these causes has, perhaps fortunately, delayed the general introduction of electricity; but now legislation has been improved, experience has been gained, confidence is being restored, and in this beautiful town of Bath fifty streets are about to be lighted, and we see everywhere around and about us in our English homes the pure glow lamp replacing filthy gas and stinking oil. The economical distribution of the electric current over large areas is annually receiving a fresh impetus.

The expensive systems defined in the Act of Parliament of 1882 have entirely disappeared. Hopkinson in England and Edison in America showed how a third wire reduced the weight of copper needed by 66 per cent. Gaulard and Gibbs in 1882 showed how the conversion of alternate currents of high electro-motive force to currents of low electromotive force, by simple induction coils, would enable a mere telegraph wire to

convey sufficient electricity to light a distant neighbourhood economically and efficiently. Lane-Fox in 1879 showed how the same thing could be done by secondary batteries; and Planté, Faure, Sellon and Parker have done much to prove how batteries can be made to solve the problem of storage; while King and Edmunds have shown how the distribution by secondary batteries can be done as economically as by secondary generators.

The Grosvenor Gallery Company in London have proved the practicability of the secondary generator principle by nightly supplying 24,000 glow lamps scattered over a very wide area of London. The glow lamp of Edison, which in 1881 required five watts per candle, has been so far improved that it now consumes but 2½ watts per candle. The dynamo, which in the same year weighed 50,000 lbs., absorbed 150-horse power, and cost 4,000*l.* for 1,000 lamps, now weighs 14,000 lbs., absorbs 110-horse power, and costs 500*l.* for the same production of external energy; in other words, its commercial output has been increased nearly six times, while its prime cost has been diminished eight times. The steam-engine has received equal attention. The economy of the electric light when steam is used depends almost entirely on the consumption of coal. With slow-speed low-pressure engines one kilowatt (1,000 watts, one 1·3-horse power) may consume 12 lbs. of coal per hour; in high-speed high-pressure triple-expansion condensing engines it need not consume more than 1 lb. of coal per hour. Willans and Robinson have actually delivered from a dynamo one kilowatt by the consumption of 2 lbs. of coal per hour, or by the condensation of 20 lbs. of steam. There is a great tendency to use small economical direct-acting engines in place of large expensive engines, which waste power in counter-shafting and belts. Between the energy developed in the furnace in the form of heat, and that distributed in our rooms in the form of light, there have been too many points of waste in the intermediate operations. These have now been eliminated or reduced. Electricity can now be produced by steam at 3*d.* per kilowatt per hour. The kilowatt hour is the Board of Trade unit as defined by the Act of 1882, for which the consumer of electric energy has to pay. Its production by gas engines costs 6*d.* per kilowatt hour, while by primary batteries it costs 3*s.* per kilowatt hour. The Grosvenor Gallery Company supply currents at 7½*d.* per kilowatt hour; a 20 candle-power lamp consuming 3 watts per candle, and burning 1,200 hours per annum, expends 82,000 watt hours or 82 kilowatt hours, and it costs at 7½*d.* per unit, 50*s.* per annum. If the

electricity be produced on the premises, as is the case in the Post Office, in the House of Commons, and in many large places, it would cost 20*s.* 6*d.* per annum. I have found from a general average under the same circumstances and for the same light in the General Post Office in London, that an electric glow lamp costs 22*s.* and a gas lamp 18*s.* per annum. The actual cost of the production of one candle-light per annum of 1,000 hours is as follows:—Sperm candles, 8*s.* 6*d.*; gas (London), 1*s.* 3*d.*; oil (petroleum), 8*d.*; electricity (glow), 9*d.*; electricity (arc), 1½*d.* The greatest development of the electric light has taken place on board ship. Our Admiralty have been foremost in this work. All our warships are gradually receiving their equipment. Our ocean-going passenger ships are also now so illumined, and perhaps it is here that the comfort, security, and true blessedness of the electric light are experienced. Railway trains are also being rapidly fitted up. The express trains to Brighton have for a long time been so lighted, and now several northern railways, notably the Midland, are following suit. Our rocky coasts and prominent landfalls are also having their lighthouses fitted with brilliant arc lamps, the last being St. Catherine's Point, on the Isle of Wight, where 60,000 candles throw their bright beams over the English Channel, causing many an anxious mariner to proceed on his way rejoicing.

Fontaine showed in Vienna, in 1873, that a dynamo was reversible—that is, if rotated by the energy of a moving machine, it would produce electric currents; or, if rotated by electric currents, it would move machinery. An electric current is one form of energy. If we have at one place the energy of falling water, we can, by means of a turbine and a dynamo, convert a certain portion of the energy of this falling water into an electric current. We transmit this current through proper conductors to any other place we like, and we can again, by means of a motor, convert the energy of the current into mechanical energy to do work by moving machinery, drawing tramcars, or in any other way. We can in this way transmit and utilise 50 per cent. of the energy of the falling water wherever we like. The waste forces of nature are thus within our reach. The waterfalls of Wales may be utilised in London; the torrents of the Highlands may work the tramways of Edinburgh; the wasted horse-power of Niagara may light up New York. The falls of Bushmills actually do work the tramway from Portrush to the Giant's Causeway, and those of Bessbrook the line from Newry to Bessbrook. The practicability of the transmission of energy by currents is assured,

and the economy of doing this is a mere matter of calculation. It is a question of the relative cost of the transmission of fuel in bulk, or of the transmission of energy by wire. Coal can be delivered in London for 12s. per ton. The mere cost of the up-keep of a wire between Wales and London to deliver the same amount of energy would exceed this sum tenfold. For long distances the transmission of energy is at present out of the question. There can be no doubt, however, that for many purposes within limited areas the transmission of energy by electricity would be very economical and effective. Pumps are worked in the mines of the Forest of Dean; cranes are moved in the works of Easton & Anderson at Erith; lifts are raised in banks in London; water is pumped up from wells to cisterns in the house of Sir Francis Truscott, near East Grinstead; ventilation is effected and temperature lowered in collieries; goods, minerals, and fuel can be transmitted by telpheage. The transmission of power by electricity is thus within the range of practice. It can be distributed during the day by the same mains which supply currents for light by night. Small industries, such as printing, watchmaking, tailoring, and bootmaking, can be cheaply supplied with power. It is thus brought into direct competition with the distribution of power by steam as in America, or by air-pressure as in Paris, or by high-pressure water as in London; and the relative advantages and economies of each system are simple questions of calculation. When that evil day arrives that our supply of natural fuel ceases, then we may look to electricity to bring to our aid the waste energies of nature—the heat of the sun, the tidal wave of the ocean, the flowing river, the roaring falls, and the raging storm. There is a mode of transport which is likely to create a revolution in the method of working tramways. A tramcar carries a set of accumulators which supplies a current to work a motor geared to a pair of wheels of the car. The weight, price, day's work, and life of the accumulator is curiously the same as the weight, price, day's work, and life of horse-flesh; but the cost of maintenance, the liability to accident, and the chances of failure are much less. Although very great improvements in batteries have been made, and they are now really practical things, sufficient experience in tramcar working has not yet been obtained to say that we have reached the proper accumulator. Nor have we yet acquired the best motor and mode of gearing; but very active experiments are being carried out in various countries, and nothing can prevent their ultimate success.

(To be continued.)

## THE TIBER WORKS, ROME.

THE embankment of the Tiber and other works connected with the same, along that portion of the river which runs through the city are still, according to the latest report of the Consul at Rome, proceeding regularly. The embankment on both sides of the lower portion of the river, from the church of San Giovanni dei Fiorentini down to the Marmorata, as well as the relative bridges, are in an advanced stage of completion. From the annual report presented to the Italian Parliament in November 1887, we learn that, thanks to the powerful means at the disposal of the contractors (Messrs. Zschokke & Terrier), the laying down of the foundations of the embankment has not met with serious difficulties. In laying down these foundations, the system of metallic caissons, by means of compressed air, is still adopted, and it has given the most satisfactory results. For the construction of the new Ponte Cestio six caissons were let down, three of which on the right-hand side of the bridge, measuring in all 49 mètres in length, and other three on the left, measuring 53 mètres 30 centims. The middle caisson, supporting the right side heading, reached a depth of 10 mètres 40 centims. below the ordinary water-mark, and the lateral ones reached the depth of 9 mètres 14 centims. The middle caisson on the left side reached a depth of 10 mètres 54 centims. and the lateral ones 8 mètres 13 centims. As regards the mode of constructing the new bridge which has to replace the present Ponte Cestio, serious opposition was raised by the Archaeological Commission, and ultimately it was arranged to demolish it completely, but to undo carefully the middle arch, so as to have it put up again on the new foundations, which will be much more solid than the existing ones. The bridge is therefore to be partly reconstructed with the old materials, and it is to maintain, or record, its present shape in all its details. The digging up of the river-bed and clearing away the old walls existing on it have, contrary to what has been said on the subject of the embankment, presented great difficulties on account of the great quantity of mural blocks and substructures overturned or otherwise buried into the river, or of the existing old pilework. This part of the undertaking has not proceeded with sufficient speed to expect that it may be completed within the time fixed by the contract. The foundations of the two supporting piers of the Ponte Margherita, which is to cross the river on a line with the Piazza del Popolo, reach a depth of 15 mètres below the ordinary water-mark. The foundations of the left-hand side heading reach 16 mètres 80 centims. in depth

STEAM MOULDING WORKS,  
BRIGHTON AND LITTLEHAMPTON.

A minor depth is considered sufficient on the right-hand side. The depth reached by the foundations of the right heading, and by those of the corresponding pier of the Ponte Umberto I., is 15 mètres 30 centims. The left heading of this bridge reached a depth of 16 mètres 15 centims., and the corresponding left pier 20 mètres 59 centims. The foundations of the central pier of the Ponte Garibaldi reached 15 mètres, and the headings of the bridge 14 mètres. Each of these three monumental bridges will have a width of 20 mètres between the two parapets.

#### REGISTRATION OF PLUMBERS.

THE Mayor of Stockton-on-Tees has fixed the 14th inst. for a public meeting in the Town Hall, Stockton, for the appointment of local representatives to join the District Council lately formed for the North of England, and Mr. J. Barkeley Smith, chairman of the Health Committee, Liverpool, has fixed the same date for the first meeting of the District Council for West Lancashire, Cheshire, and North Wales.

#### ARCHITECTS' COMPENDIUM AND COMPLETE CATALOGUE.

WE have been forwarded the specimen pages and prospectus of the third annual issue of the "Architects' Compendium," now preparing for the press, which gives promise of a work of great importance to architects and the manufacturers and merchants connected with the building trade. The plan of the work has been entirely revised, and several new features have been added which will increase its usefulness. We also notice that the "Complete Catalogue," which received the recommendation of a large number of architects of standing, has been merged in the "Compendium." Briefly, its contents will comprise a register of leading manufacturers and merchants, with telephone number and telegraphic address; a register of leading builders; a dictionary of manufacturers' specialties; a complete catalogue of detailed, illustrated, and priced particulars of goods; and also tables and other information for reference. The manufacturers who have taken space in the "Complete Catalogue" include many of the best-known names, and they

are inserting illustrative plates, lithographed designs, &c., which will add to the value and attractiveness of the work. A superior professional diary is to be published as a companion volume to the "Compendium."

#### LONDON WATER SUPPLY IN THE PAST.

THE exhumation not long ago of sundry wooden tubes or pipes in front of the new Law Courts in the Strand has drawn attention to some of the bygone conditions of the water supply of the metropolis. That wooden water pipes were also used in the provinces in past years is well known, the *Standard* says, and the records of the Hertford Corporation contain sundry entries of money paid for the construction and repair of such pipes during the sixteenth century. To lay down a cast-iron main for the conveyance of water would seem a very simple and obvious contrivance. Yet the history of the water supply shows that it has required a long course of experience to bring the mode of distribution to its present point of refinement. There has been the leaden age, the wooden age, for a brief period the stone age, and now at last the age of iron. It seems like a curious anticipation of the present schemes of Local Government and the possession of the metropolitan water supply by a municipal authority, that quite at the commencement of the thirteenth century the Corporation of London intercepted certain springs feeding the water-course known as the Tye-bourne, and gathered them into reservoirs, situated near Marylebone Lane. From this point the water was conducted in a 6-inch lead pipe to Charing Cross, along the Strand and Fleet Street, crossing the Fleet by means of the bridge which then existed at that spot, and proceeding up Ludgate Hill to Cheapside, where it was discharged into the conduit at the western end of that thoroughfare. This water was derived from the gravel beds forming the subsoil of Marylebone, and in those days was, doubtless, free from any dangerous contamination. The degree of hardness attaching to it would also prevent any risk of lead poisoning. At the present time a portion of the water supply of the metropolis is drawn from the gravel beds which underlie the banks of the Thames above London, and the water companies are endeavouring to increase the quantity taken from this source. These Marylebone Waterworks—if we may so term them—were the property of the Corporation, the owner of the land whence the springs issued being induced, under royal influence, to make a grant of

the water to the civic authority. The lead pipe was paid for by certain merchants of Ghent, Bruges, and Antwerp, who received as a *quid pro quo* an exemption for a term of years from river dues and tolls on the goods they imported into London. The king took his share of the benefit by having a gratuitous supply of water for his stables, situated on what is now the north-east corner of Trafalgar Square. For many years the Corporation paid an annual visit of inspection to the Marylebone springs and reservoirs, celebrating the event by a dinner held in a banqueting-hall constructed on the arches by which the reservoirs were covered.

The supply of water to the people of London by means of conduits, utilising local springs, proved insufficient as the metropolis grew in size. Traces of this obsolete method are preserved in the names of Conduit Street, Lamb's Conduit Street and Conduit Vale. Towards the close of the sixteenth century recourse was had to the Thames, and as the main drainage works were then altogether out of the reckoning, the river at London Bridge was deemed a source sufficiently pure for a domestic water supply. This was the beginning of a new order of things and brought with it what may be called the age of wood. An enterprising Dutchman, named Peter Morrys, having obtained the consent of the Corporation, erected a tidal water-wheel under one of the arches of old London Bridge, by means of which he worked a force-pump, raising water from the Thames and driving it through leaden or wooden pipes laid in the streets, whence branch pipes conveyed water into the houses. This was fairly the germ of the system which now governs the metropolitan water supply. The tidal wheels under London Bridge were increased in number to meet the growing demand, until at last, in 1820, the works at the Bridge supplied as much as twenty-six million hogsheads of water during the year. As the London Bridge Waterworks came into operation soon after 1582, it is possible that wooden pipes three hundred years old are to be found in some parts of the city. But although the supply went as far west as Fleet Street, it is not certain that the Dutchman's wooden pipes extended beyond Temple Bar. When the London Bridge Waterworks were discontinued, consequent on the pulling down of the old bridge, the New River Company made an equitable arrangement with the proprietors, and absorbed the Dutchman's district into their own. The area served by the New River Company extends along Fleet Street into the Strand, and wooden pipes have been dug up in Fleet Street, apparently continuous with those opposite the new Law Courts.

It was not long after Peter Morrys set up his water-wheels that the New River project was started, in some degree introducing a competing supply. It was a great achievement to bring the pure spring waters from the neighbourhood of Ware, in Hertfordshire, into the reservoirs at Clerkenwell; but it was also felt to be a difficult matter to distribute the water to the various parts of the metropolis where it was needed. "This was done," says the record of the time, "with all possible diligence, by pipes of elme and lead, but for the most part elme, from which pipes many high streets and lanes within the City are plentifully served." This "plentiful serving" is exemplified by the circumstance that in 1616, in consideration of a certain sum to be paid yearly, Sir Hugh Myddelton granted to a citizen and his wife a lease for twenty-one years "of a pipe or quill of half-inch bore, for the service of their yarde and kitchine by means of two swan-necked cocks." Such a supply as could be obtained through a pipe "of the size of a goose-quill" was that which the king obtained from the Corporation in recognition of the royal assistance in getting a grant of the water at Marylebone. Perhaps the supply was constant, in which case it would excel the present intermittent system; and, when the water flows continuously, a goose-quill will yield a considerable quantity. In the foregoing lease granted by Hugh Myddelton the "quill" is specified as being half an inch in diameter, which shows that the term had a technical meaning when not otherwise expressed.

Some singular relics of the old water supply of London were shown in the International Health Exhibition at South Kensington in 1884. The New River Company sent a pail made out of an old wooden pipe dug up in Southampton Row, as also one of the actual pipes. The East London Company threw some light on the manufacture by exhibiting a set of cutters used in boring the wooden mains. These tools were said to be about a hundred years old. The Grand Junction Company sent a specimen of a wooden water main "as formerly in use in the London streets," dug up about seven years previously. The Southwark and Vauxhall Company exhibited some old wooden pipes and stop-valves taken out of the ground in Redcross Street, Southwark, and supposed to have been fixed about the year 1814—a somewhat late period. The West Middlesex Company sent specimens of stone pipes, "as used by the company until 1807 for supplying the water into the district." The same company also furnished specimens of the wooden pipes. They abandoned both stone and wood in 1807. Stone was tried as a substitute for wood in the hope that it would

prove less liable to leak. It probably proved the worst of the two, owing to the yielding of the joints under pressure. The West Middlesex Company appear to have entertained considerable hope at one time that stone pipes would answer, judging by the fact that they laid down a quantity in various parts of the district, the diameters ranging from 2 inches to 12 inches. The Hertford records show that wooden pipes were sometimes strengthened by means of iron hoops. Elm was used at Hertford, as in London, and the process of boring is mentioned. The date of 1814, when the Hertford Corporation resolved on using iron pipes instead of wooden ones, corresponds very closely to the time when the same change took place in London. The necessity of having mains of large diameter, and the general requirement for water at high pressure, would help to render wood an obsolete material. The East London Company laid iron pipes at the commencement of the present century, in lieu of the old wooden ones used by the Shadwell and West Ham Companies, the complaint being that the wooden mains "were totally inadequate to withstand the pressure"; but the cost of substituting iron for wooden pipes, together with the erection of some powerful pumping machinery, was felt as a heavy burden by the Southwark and Vauxhall Company about half a century ago.

#### THE DRAINAGE OF MANCHESTER.

AN inquiry is being held by the Local Government Board, in regard of the application by the Manchester Corporation for sanction to borrow 490,000*l.* for purposes of sewerage and sewage disposal. The city surveyor, Mr. John Allison, on Tuesday gave the following details in the course of his evidence.

Mr. Allison said he was a member of the Institute of Civil Engineers, and had been the city surveyor for ten years. He had held similar appointments for twenty-two years, and had considerable experience of drainage works for the interception of sewage. While at Bradford he had ample opportunities of judging of the precipitation process. When he came to Manchester the sewage question was beginning to be discussed. In 1880, along with the Rivers Committee of the Corporation, he visited nearly all the principal sewage works in England. In 1884 they revisited some of the systems which seemed best adapted to their requirements, having first of all satisfied themselves that an irrigation scheme was impossible for the district. After full consideration, the committee were unanimous in

agreeing to adopt almost a facsimile of the works at Leeds. The Leeds scheme was for precipitation works at the outfall. The Manchester scheme, as now before the Commissioner, was first of all a gravitation scheme. No pumping would be required at all throughout the city. The only pumping in the whole scheme would be for lifting some of the effluent out of the effluent well and also for pumping up the sludge. The sewage proper would not be pumped at all. The general outline of the present scheme was that of an intercepting sewer. Manchester at the present time was drained throughout the entire area by outfall sewers gravitating towards the three valleys—the Medlock valley, the Irk valley, and the Irwell valley. The sewers would be laid with a view to making use of the natural conformation of the ground. For the purposes of the scheme, the city was divided into drainage areas, to which a prospective population was assigned—that was to say, the population when the area was built upon. Giving a few general statistics, he said the area of the city was 5,929 acres, and the present population 378,000. The average rainfall was about 35 inches. For an average of 111 days, the rainfall did not exceed  $\frac{1}{8}$  inch; for 39 days the rainfall did not exceed  $\frac{1}{4}$  inch, and there were 35 days in which the rainfall exceeded  $\frac{1}{4}$  inch. That left an average of 186 days on which no rain fell. The average had been taken over a period of five years. The present water supply for the city was 13 gallons per head for domestic purposes, and 7 gallons per head for trade purposes, making a total of 20 gallons per day per head. Manchester was not a water-closet town. It had 18,800 water-closets, representing a population of 94,000. Of dry earth-closets there were 66,000, and of ashpits 4,000. There were no cesspools. Very few of the manufactories were connected with the sewers. The witness described in detail the drainage areas and the intercepting sewers it was proposed to construct within the city. Such sewers as were more than 18 feet deep would be made in tunnel to interfere as little as possible with street traffic. In Stretford Road the outfall sewer would be made in tunnel. The sewers were calculated on a scale that would be sufficient for all time. They would provide for a population within the city of half a million. When the Thirlmere water scheme came into operation, as it probably would in three or four years, the people would, no doubt, gradually become educated into using more water than they did at present. The average allowance at present was about 20 gallons per head per day, and the scheme was based on the notion that it might be increased to 40 or 44 gallons. Pro-

vision was also made to carry off half an inch of rainfall in twenty-four hours. The two large main sewers would be able to pass 100,257,000 gallons in twenty-four hours, or 11,139 cubic feet per minute. From the city boundary the sewage would be taken along Stretford in an outfall sewer 14 feet by 10 feet 6 inches at a gradient of one in 2,640. Running three-quarters full, it would pass 19,588 cubic feet per minute. Running full bore, it would pass 21,849 cubic feet per minute. Opposite the Blind Asylum there would be a storm overflow, communicating with the river, and eventually with the Ship Canal. After this point the outfall sewer was reduced to 10 feet in diameter. Another storm overflow was provided at Throstle Nest. The sewage works at Davyhulme would be constructed on a scale to meet no more than the present needs of the city, with a slight margin. The population at present was 378,000, using a water supply of 20 gallons per head per day, and the works would be constructed to meet the wants of a population of 400,000, using 25 gallons of water per head per day. It would be very easy to increase the capacity of the works as was found necessary. A series of twenty tanks would be constructed, each tank 100 feet long and 60 feet wide, 7 feet deep at one side and 5 feet at the other. Mr. Allison explained the treatment of the sewage on its arrival at the works and its subsequent precipitation in the tanks. The sludge on being taken out of the tanks would be dried on beds of land outside. The daily bulk would be about 120 tons, and this would in about four days dry down to 25 tons, in which there would still be 46·9 of moisture. It was anticipated that there would be no difficulty in disposing of the dried sludge to farmers. In Leeds the demand for the material was greater than the supply. About 95 acres of land had been purchased for the sewage works. The tanks would occupy about three acres, and the sludge beds about two acres. Mr. Allison described the disposal of the effluent water, which it is proposed to pass over filtration beds before it sets out for the Irwell. When the volume of sewage was under ten million gallons in the twenty-four hours it would pass through the tanks, but would go into the river without passing through the filter beds. When the volume rose above 40 million gallons it would go straight into the river without any treatment at all. So large an admixture of flood water as was implied in these circumstances would be taken as effecting the object aimed at by the treatment at the works. He had visited Leeds, Coventry, and other places where the proposed system was in operation, and his experience was that no nuisance was created. There was no smell at all

from the works. In regard to the site of the proposed works at Davyhulme, there were no houses within 400 or 500 yards. He could not see any respect in which the works would be a nuisance. The scheme was not a scheme for flood water as well as sewage. The total cost he estimated at 465,358*l*., including the cost of the land.

#### DEVELOPMENT OF TRAFFIC.

UNDER the title of "A Few Arguments in Favour of Light or Road Railways," Mr. T. S. Sellon read a paper at a meeting of the British Association. He said that there was no reason why the present tramway system, familiar in most of our principal towns, could not be made (with some modifications) of exceptional value as feeders to the trunk lines, and as a means of transit for every description of goods and merchandise as well as passengers. By utilising the sometimes considerable waste, so often met with along the side of our country roads, cheap and efficient feeders could be constructed, thereby saving the cost of land purchase, or the heavy cost of maintenance if constructed on the road. A line which had been constructed on this principle, and which had been working for the last eighteen months, was mentioned as proving how increased facilities made increased traffic. It carried the entire population of the whole district once a week, besides dealing with the whole of the cartage and delivery of goods to and from the London and North-Western Railway, with which the line was connected, as well as all the parcels and mails. Besides the advantages proved by the large patronage it received, the property in the district since its opening had risen 20 per cent. in value, and houses which had long been in want of tenants were now all occupied. As the object of this class of railway was to carry heavy goods and other merchandise that would otherwise be drawn along the road, it was clear that there must be a great saving in the wear and tear of the same, as well as a material relief to the road rates which, in some country districts, were a great burden. Being a tramway, the working expenses, as compared with railways, were very small, owing to the absence of stations and station officials, signals, and telegraph. The author was strongly against the construction of this class of light railway to any other gauge but that of the line it fed, as he affirmed that the plea of economy could not be maintained, and that one of the chief causes of the failure of the Irish Tramway Act, 1883, was the fact that the gauge

### GRUNDY'S PATENT WARM-AIR VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

#### TESTIMONIALS.

9 Victoria Chambers, Westminster, S.W.  
SIR.—I have much pleasure in testifying to the efficiency of  
your patent warm-air fire-grate. It has been very successful,  
and given every satisfaction where I have used it.  
Yours, &c., JAMES WEIR, F.R.I.B.A.  
To Mr. Grundy, 6 John Street, Bedford Row, W.C.

From ARTHUR W. BLOMFIELD, M.A., Esq., Architect,  
22 Montagu Square, London, W.  
Mr. Grundy, of Tyldesley, near Manchester, has carried out  
his plan of warming in several churches built under my  
direction, and in each case it answers remarkably well, and has  
given great satisfaction.

From Professor W. B. ROBERTSON, M.D., West Dulwich, S.E.,  
September 1, 1887.  
DEAR MR. GRUNDY.—I value your apparatus very highly  
indeed. I regard it as the greatest comfort I have in this house.

From Rev. A. FERGUSON SKYLLY, Dean of Derry, The Deanery,  
Derry, September 16, 1887.

DEAR SIR.—I cannot refuse to give you a few words of com-  
mendation as to the apparatus you supplied for heating Derry  
Cathedral. Not only is the air of the Cathedral quite pure and  
pleasant to those attending the services, as it must be from the  
fact that most of the air heated is taken from the outside, but I  
find the building itself is so much benefited, as formerly it was  
damp and smelt damp, but now it is very dry and free from any  
musty smell. I find that, although the Cathedral is now much  
larger, the cost of firing is much less.

To Mr. John Grundy, 30 Duncan Terrace, City Road, London.

From Hon. and Rev. G. G. C. TALBOT, M.A., Withington,  
Cheltenham.  
DEAR SIR.—You will be gratified to hear that the school is  
completely warmed by your new grate. It is the most economical  
and efficient that I have ever seen.

Mr. John Grundy.

STONE FIRMS.

was fixed at 3 feet, the fallacy of which had been demonstrated by the report of the late Royal Commission on Irish Public Works. He also pointed out the great necessity there was for the reform of Private Bill legislation, there being far too much expense in the introduction of a scheme, *i.e.*, prior to consideration, a mutilated Bill being often accepted by the promoters in consideration of the money already expended. In these days of progress landowners were urged to thoroughly examine the merits of a scheme before they threw away their money in opposition, as by arrangement with promoters all their objections might easily be overcome. By a comparison between the ordinary service of a branch line and the ordinary service of a light railway, it was demonstrated by the actual returns of the latter that it was to the interest of all railway managers and railway shareholders to give every facility for the construction of these feeders, which must largely increase the value of their properties.

#### DOCKS AND CANALS.

THE new Barry Docks, now approaching completion on the north shore of the Bristol Channel, were described by Mr. J. W. Barry, C.E., at the meeting of the British Association. These docks, he said, are situated about seven miles westward of Cardiff, between Barry Island and the mainland, and the approaches from the sea are very easy. Good anchorage exists eastward of the docks between Barry Island and Sully Island. The docks are, as is the case with other docks on the Bristol Channel, tidal, and thus can only be approached for a few hours at high water. The range of tide in the Bristol Channel is large; at Barry there is a range of 36 feet at ordinary springs and of 19½ feet at ordinary neaps. There is a depth of 25 feet of water at low water of spring tides within 700 yards of the entrance gates of the Barry Docks. The main object of the Barry Docks is for the shipment of South Wales coal, but it is expected that a considerable import trade will also be developed. The Barry Docks are connected with the coalfields by new railways about 27 miles in length which are nearly finished. The entrance of the docks is on the east side of Barry Island, which protects it from westerly and south-westerly winds. Against other winds the entrance is protected by two breakwaters composed of rubble protected by 6-ton blocks of stone on the sea-slope. The waterway between the breakwaters is 350 feet, and the entrance is 485 yards within

the breakwater heads. A channel of that length is to be dredged to the entrance. The entrance is 80 feet wide, and has a pair of wrought-iron gates which will be opened and closed by direct-acting hydraulic cylinders; it gives access to the basin, which is 600 feet long and 500 feet wide, having an area of 7 acres. Beyond the basin is the dock, which is 3,400 feet long and 1,100 feet wide. This width is divided at the western end of the dock into two arms by a projecting mole. The water area of the dock is about 70 acres. A graving dock, 700 feet long and 100 feet wide, is being made at the north-east corner of the dock. Eastward of this is the timber pond of 24 acres, approached from the dock by a short canal. The total area of water in the dock, basin, and timber pond is upwards of 100 acres. The depth of water at the entrance is 38 feet at high-water spring tides, and 29 feet at high-water neap tides.

Mr. Lionel B. Wells, C.E., read a paper on the "Plant and Machinery in use on the Manchester Ship Canal," and stated that the plant for a contract of such magnitude, to be completed within a limited time, is necessarily great in quantity and of the most improved description. In addition to the usual locomotives, which already number eighty-seven, there are upwards of sixty steam-diggers of various models, some of which were referred to in detail and photographs shown; also new excavating machines were described, which, under the name of the French or German excavator, for each nation supplies its especial machine, have been for the first time introduced into this country. The action of the machine is that of a bucket-dredger, but instead of being water-borne it is worked on a railway. The excavations exceed a million and a quarter cubic yards a month, and the output is still increasing.

Mr. S. Lloyd, in a paper on an improved canal lift, referred to the antiquity of canal navigation and to the difficulties of working locks with a small water supply. He advocated the use of hydraulic lifts of an improved type. Three of these were in use—one in Cheshire, and two on the continent. In each case the boat was floated into a receptacle full of water, and was raised or lowered in it, the receptacle being supported by a ram fixed vertically beneath it. The method of transferring the boats from one level to another was rapid and economical.

A paper on the Panama Canal, by M. de Lesseps, was read at the meeting of the British Association by Mr. H. J. Mackinder, in the geographical section.

The canal, the author said, had an altitude of 100 mètres above sea level, and the work had been undertaken in the

# KALLKOLITH.

## NEW PATENT PRIMING AND STAIN.

Acknowledged by experts of nearly every country to be one of the most important inventions of the Nineteenth Century.

REGISTERED

PATENTED IN  
England,  
Belgium,  
France,  
Germany,  
Italy.

TRADE MARK.

PATENTED IN  
Austria-  
Hungary,  
Denmark,  
United  
States  
of America.

**KALLKOLITH** is one of the most marvellous inventions of the present age, and is used as a priming in place of the now almost obsolete oil-colour. It produces an exquisite smoothness, combined with great durability, and amalgamates thoroughly with wood, iron, cement, stone, plastering, &c.

**CHEAPNESS.**—It saves at least 100 per cent. in comparison with any other priming now in use, being less than half the weight.

**ECONOMY** is manifested by the fact that one 14-lb. tin of **KALLKOLITH** goes further than three times the same quantity of oil-colour.

**DRYING POWERS.**—It dries within one to two hours, thereby greatly facilitating the quick dispatch of labour.

**DURABILITY.**—Where **KALLKOLITH** is used it imparts an amount of durability to all oil-colours used upon it which has never yet been obtained, and one of the most important advantages in its use is that the paint put upon it does not blister.

**PAPER-HANGING.**—Walls prepared with **KALLKOLITH**, thinned with seven parts of water, give a great additional advantage to the hanging of all descriptions of papers.

#### TESTIMONIALS.

21 New Bridge Street, London, E.C.: February 23, 1886.  
I have had some trials made with the **KALLKOLITH** during the past few weeks, the results of which are very satisfactory. The **KALLKOLITH** is to be used as the first coat of paint on wood and other substances, and is of such a nature that the ordinary work in preparing for paint is considerably lessened, and the usual number of coats now given reduced, and, once fairly introduced in the market, I am certain there will be a large sale.  
J. WM. STEVENS, Architect and Surveyor.

75 Newmarket Street, Oxford Street, W.: Feb. 15, 1887.  
We are pleased to tell you that the **KALLKOLITH** supplied to us has been fairly tried, and we find that it answers all that you claim for it.  
CAMPBELL, SMITH & CO.

Price per case of 8 Tins of 14 lbs. each, net 40s., packing included. Special terms to Wholesale Buyers and Shippers.

Address—**KALLKOLITH CO., 175 STRAND, LONDON, W.C.**

narrowest part of the American isthmus. The total length would be 74 kilomètres, 68 of which belonged to the canal, properly speaking, and six to the roadsteads. It would be 22 mètres wide, having a depth of water of  $8\frac{1}{4}$  mètres. It will be provisionally constructed with ten locks in order to be open for general navigation in 1890. After describing the manner in which ships coming from Europe would enter the canal and the various ports and points of interest they would pass *en route*, together with the geographical and physical aspect of the country, the paper showed that in November 1887 direct communication had been opened, by means of the excavated canal, 17 kilomètres from Colon on the Atlantic side and upwards of 8 kilomètres from Boca on the Pacific side. Since this period the work had been proceeded with on those portions of the canal in the direction of widening and deepening it. In April last the canal had attained its entire width from Port Christophe over a length of  $4\frac{1}{2}$  kilomètres. The depth, which had been obtained nearly up to 18 kilomètres, varied from a minimum of 5 mètres to a maximum of  $8\frac{1}{4}$  mètres. The provisional opening of the canal by locks, intended for the first months of 1890, would necessitate the excavation of 40 million mètres, ten millions of which were in hard material. During the six months between January 1 and June 30, 1888, the excavations had reached a total of 7,479,400 cubic mètres, which had exceeded, by nearly 100,000 cubic mètres per month the average which the contractors had to make during that time. The cutting of the Panama Canal, while it would prevent navigators undertaking the dangerous passage round Cape Horn or passing the Straits of Magellan, would equally benefit the shipowners and merchants, owing to the considerable diminution which would take place in the cost of assurance, and would shorten considerably the distances between the ports of the two hemispheres. In 1866 Admiral Davis, of the United States Navy, was directed by the Senate to estimate the total tonnage which would pass through the canal if it were finished, the value of the change of route, and the saving which would result; and he estimated that the total tonnage, according to the official reports, would be 3,094,070 tons; the value of the commerce would be 467,831,130 dols; the saving by the use of the canal on that amount would be 49,530,390 dols, and he estimated the tonnage using the canal in 1876 at 6,188,140 tons. The International Congress, which met at Paris in 1879 and decided the route of the canal, sent a special commission to report on the same subject. That commission estimated the tonnage which would pass through the canal in 1889 at  $7\frac{1}{2}$  million tons. It

was this calculation, giving receipts amounting to 112,500,000 frs., which had served as the basis of the constitution of La Compagnie Universelle du Canal Interocéanique. Since the assembly of the International Congress in 1879, these forecasts had been confirmed and enlarged. The author contended that there could be no doubt that in the future the working of the Panama Canal would be remunerative to the capital which had been employed in its execution. The interested adversaries of the universal work sought in vain to dispute the results, which certainly would be more considerable than those of the Suez Canal, because it would not be, like the Egyptian canal, exclusively accessible to steamships. All vessels from the first day would pass the Panama Canal and continue their navigation in the two oceans joined together by an artificial strait as was the case in the Mediterranean and the Red Sea. The Panama Canal would be open at first to navigation by means of locks, and its eventual transformation into a canal on the level would be carried out proportionally to maritime progress and the increase of receipts.

#### UTILISATION OF WATER SOURCES.

At the Congress of the British Association, Mr. J. Bailey Denton read a paper on "The Replenishment of the Underground Waters of the Permeable Formations of England."

The author, having long advocated, he said, with the late Sir John Rennie and others the storage of the surplus rainfall in reservoirs or lakes to be constructed in the higher tributary valleys of our river systems to maintain them in full service, invites attention to the capabilities existing of replenishing at the same time the subterranean supplies of the water-bearing strata by shafts to be sunk down to the line of their saturation. Of the 27 inches forming the mean average annual rainfall, about two-thirds, or 18 inches, are evaporated from the surface, while of the remaining third 4 inches serve to maintain the river system, and 5 inches pass away as floods and freshets. Instances are numerous in which the year's rainfall exceeds 30 inches, while they are very few in which it is less than 20 inches—about three times in twenty years. As the amount of evaporation is nearly a constant figure, and the quantity required to maintain effectually the river system necessarily remains the same under all conditions, the amount of flood or excess water greatly varies. It is sometimes double the average. On the few occasions when the rainfall

does not reach 20 inches it is insufficient to satisfy the demands of the river system, and then the river becomes a borrower from the stored supply of the subterranean reservoirs. On such occasions the quantity of water flowing down the river to Kingston has been so reduced as not to reach 300 million gallons in twenty-four hours. The importance and bearing of this fact upon the proposal to replenish the subterranean supply will be appreciated when it is pointed out that the quantity of water supplied daily to the metropolis by the water companies has already exceeded 150 million gallons. Of these 150 millions the River Thames contributes 50 per cent., or 75 millions, which is a quarter of the quantity flowing past Kingston. The Lea furnishes 38 per cent., and deep chalk wells the remainder, or 12 per cent. The quality of deep well waters has become of late years more and more improved. Dr. Edward Frankland, in his classification of potable waters, places deep well waters only second to springs issuing from the outcrops of the same formations. To make good the loss of this superior water, the author proposes that whenever the water in the river rises above a certain datum height recognised as the gauge of its full service, the excess shall be diverted out of the river course on to filter-beds formed near at hand. The outlet from these filter-beds would be steined shafts or sumps sunk down to the water level beneath, and into them the filtered water would pass after it was freed from flocculent matter. The steined shafts would be made watertight, and sealed against all surface contamination.

"The Raiyān Project for the Storage of Nile Flood" was described by Mr. Cope Whitehouse, M.A. He said:—The project is one for impounding a part of the surplus flood of the Nile. A series of surveys show that the Wadi Raiyān is a depression 75 miles to the south-south-west of Cairo, communicating with the Nile Valley at +26 mètres, or a little below high Nile. Except at two narrow passes, it is bounded by precipitous limestone hills rising to +190 mètres. The bottom, of sand and clay overlaying rock, sinks to -46 mètres. A reservoir formed by putting this valley in communication with the Nile flood would have at +30 mètres a surface of 686 square kilomètres (250 square miles), or 686 million square mètres, and hold 20,559 million cubic mètres. At +20 mètres the surface is 550 million square mètres, and contents 14,876 million cubic mètres. It would yield (without pumping) a net 40 million cubic mètres per diem for 100 days, or about the average discharge of low Nile from March to July. It would practically double the summer (Sefi) irrigation of Egypt. The

works could be completed within one year, and the Wadi Lulu and Wadi Safir, being detached from the Wadi Raiyān, could be used as small reservoirs until the Raiyān Basin was available. It would require one season to fill the small basins, and three to fill the Raiyān reservoir.

#### PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Cassell, Consulting Patent Agents, 43 Southampton Buildings, Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

#### APPLICATIONS FOR PATENTS.

12540. John Mason, for "Improvements in skylights, ventilators, &c." August 31, 1888.  
12552. Norman Knowles, for "Improvements in apparatus for automatically regulating the temperature of greenhouses and other buildings." August 31, 1888.  
12589. Henry William Joseph White, for "Improvements in window-fasteners, specially applicable to sashes, casements, doors, and for other similar purposes." (Complete specification.) September 1, 1888.  
12674. Herman Leisner, for "Improvements in gas regulators." September 3, 1888.  
12659. Henry Atkinson, for "Improved method of suspending and working window-sashes, doors, Venetian and other blinds, curtains, &c." September 3, 1888.  
12660. Thomas Bloomfield Secker, for "An invention for doors: the automatic door steadier." September 3, 1888.  
12668. John Taylor, for "A stench trap for sewers and sewage purposes." September 3, 1888.  
12708. Edward Nunan, for "Metal lathes for building purposes." September 3, 1888.  
12713. Thomas Sharples and Hugh Gardiner Graham, for "Improvements in the construction of fixing windows." September 4, 1888.  
12739. James Lamb Hancock, for "A novel method of means for creating up-draught in chimneys and for ventilating purposes." September 4, 1888.  
12771. Richard Cardwell Robinson, for "An improved construction of die for use in brick-making machines." September 4, 1888.

GUARANTEED CIRCULATION to ALL ARCHITECTS in GREAT BRITAIN.  
THIRD YEAR OF ISSUE. THE

Architects', Surveyors', & Engineers' Compendium,  
AND COMPLETE CATALOGUE.  
EDITED BY JOHN ED. SEARS, A.R.I.B.A., F.A.S., AND C. STANLEY PEACH.

#### IMPORTANT NOTICE.

The next issue will contain a **DICTIONARY OF MANUFACTURERS' SPECIALTIES**, and the Editors will be pleased to receive particulars or catalogues of goods, with the leading specialties marked. Names of approved specialties are inserted **WITHOUT CHARGE**. The special feature of the work is **THE COMPLETE CATALOGUE**, in which detailed and priced particulars of goods, with each article indexed, are brought together and classified for the reference of Architects, Contractors, and others. A large number of leading firms have already taken from **FOUR TO SEVEN PAGES EACH**, are inserting plates and lithographed designs of their goods, and many advertisers in previous issues have taken greatly increased space.

This work has the favourable recommendation of the President and Members of the Council of the Royal Institute of British Architects, and a large number of other eminent Architects. Full particulars of

## FOR TONE, TOUCH, GENERAL FINISH, AND GOOD VALUE.

Wholesale and Retail Depot:—London, 211 Regent Street, W.

12845. Frank William Allchin, for "Improvements in asphalte surfaces of roads, footpaths, floors, and a means for preparing the same." September 5, 1888.

12910. Edward Thomson, for "Improvements in the mode of laying wood floors in materials to be used therefor." September 6, 1888.

#### PROVISIONAL SPECIFICATIONS ACCEPTED.

10880. James Gush, for "Improvements in the method of fixing sliding windows in their casements to facilitate cleaning from the inside." July 27, 1888.

10960. Edw. Tippet Newton, for "Improvements in and relating to surveying and levelling instruments." July 28, 1888.

10990. Chas. Shrewbrooks, for "Improvements in the construction of roofing tiles." July 30, 1888.

11085. Richard Isaac Kiln and Charles Henry Kiln, for "Improvements in roller blinds and fittings therefor." July 31, 1888.

11335. Richard Hawkes, for "Improvements in apparatus for flushing water-closets and urinals and for such like purposes." August 4, 1888.

11603. Charles Darrah, for "Improvements in ventilators." August 11, 1888.

11609. Walter Jones, trading as Jones & Attwood, for "Improvements in or relating to the means of connecting or fixing lids or covers over manholes and analogous openings in metal cisterns and tanks and like receptacles or holders." August 11, 1888.

#### COMPLETE SPECIFICATIONS ACCEPTED.

Notice is hereby given, that all persons interested in opposing the grant of a patent on any one of the undermentioned applications may, at any time within two months from the date of the official *Journal*, give notice at the Patent Office in the prescribed form of such opposition.

14955. Daniel Thomas Bostel and William Bostel, for "Improvements in syphon flushing cisterns." November 2, 1887.

15071. John Wright, for "An improved chimney-top, applicable also as ventilator." November 5, 1887.

15203. John West, for "Improvements in water-waste flushing cisterns." November 8, 1887.

15065. Frederick Ransome, for "Improvements in the manufacture of cement." November 4, 1887.

10426. Ralph Waldo Emerson McIvor, for "Improvements in the production of white lead or carbonate of lead by the apparatus therefor." July 18, 1888.

11157. Heinrich Meidinger, for "Improvements in gas and similar stoves." August 1, 1888.

#### PATENTS SEALED, SEPTEMBER 7, 1888.

9074. W. H. Z. Cooper, for "Making, furnishing, and drying plain or socketed stoneware sanitary pipes or tubes." June 28, 1887.

10511. W. N. Swettenham, for "Automatic flushing apparatus for water-closets." July 28, 1887.

11508. R. R. Harrison, for "Improvements for opening, closing, and adjusting sashes, &c." August 24, 1887.

7774. J. S. Dunn, for "Improvements in stays for case-ments, fanlights, and the like." May 28, 1888.

1087. Salvatore Orlando, for "Improvements in steam-boiler or generators." January 24, 1888.

#### ABRIDGMENTS.

Paving, flooring, and roofing material." No. 13902. 1887. Robert Punchon, 8 St. Benet Place, Gracechurch Street, E.C. A composition in suitable proportions of granite, granulite, syenite, elvan, whin, Kentish rag, greenstone, tinstone, sandstone, freestone, trap, marble, limestone, iron slag, coke, burnt clay, slate, spar, quartz, bitumen, asphalte, ozokerit, resin, and oil. These are reduced to sand or finely divided particles, and mixed together with the aid of heat.

"Improved devices for facilitating the cleansing of drains." No. 13161. 1887. S. G. Huntley, 9 Duke Street, Adelphi, London. This invention relates to the cleansing out of drains.

*Claim 1.*—The combination of a frame, removable cover adapted to fit the same tightly, nozzle projecting from the bottom of the said frame, and removable cover adapted to close the mouth thereof, gas-tight and to be held down thereupon, as set forth.

"Improvements in wall-ties or band-iron." No. 16234. 1887. John Sheldon, 10 St. Augustine's Road, Birmingham.

*Claim 1.*—Making in the pieces or lengths of hoop iron or other strips of iron of which the wall-ties or band-iron are made a series of corrugations or undulations, crossing the said pieces or lengths at right angles to the longer sides of the said pieces or lengths, for the purposes and substantially as hereinbefore described and illustrated by the accompanying drawings.

TO INVENTORS.—Patents for Inventions, Trade-marks, and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CASSELL, Patent Agents, 43 Southampton Buildings, Chancery Lane.

## THE WEEK.

A COMMITTEE has been formed for the purpose of preserving Kirkstall Abbey as a public monument. Mr. GEORGE GILL, who has undertaken the honorary secretaryship, says that a number of gentlemen, who desired that the abbey and grounds should be secured for the public, discussed the question together, and, knowing how difficult it would be for the Corporation to move with sufficient promptness in the matter, formed themselves into a committee, with power to add to their number, with the object of purchasing the estate, with the view of its being subsequently acquired by the town or settled under some other disinterested trust, under provisions that would secure the necessary steps being taken to stop the further destruction of the abbey, to provide for its protection and maintenance in future, and to insure the dedication of the abbey and grounds to the use and enjoyment of the public for ever. The committee has opened negotiations for the purchase of the estate, and one of its members has engaged to advance the necessary money if terms of purchase are agreed on.

A PROPOSAL has been made to place statues of WALLACE and BRUCE, the two Scottish heroes, in Edinburgh. A public competition, it appears, will be resorted to as a means of obtaining a pick out of the ranks of sculptors, and it is suggested that no premiums should be bestowed. No doubt the sub-committee of the Edinburgh Town Council consider their little economies will be a pleasing offering to the memory of the departed heroes. A site, it is thought, will be found for the statues on the Prince's Street Esplanade, and the cost of the statues, it is presumed, will be about 3,000*l*.

MUSEUM education has been much in favour of late years, and an exact return of the increased number of such centres of education would be interesting. Now, however, it appears that, though we have the museums, there is something still wanting before they will fulfil the purposes of instruction. Many suggestions are put forward. Exhaustive penny catalogues, "full of interesting descriptive notes," should be published; popular lectures, aided by a magic lantern—such are some of the suggestions. No doubt, if funds are forthcoming to remunerate lecturers, plenty of professors will also be forthcoming. But the idea that seems to have been in the minds of those who advocate the establishment of museums, is that professors and teachers in technical schools and colleges neither can nor are supposed to carry museums in their pockets, and that students who have gone through any training at all will know how to utilise the museum without carrying a professor there with them, so long as the objects are not locked up in the cellars, at any rate. There is no reason whatever why proper arrangement and classification of objects should not be insisted on in all museums, and also a simple catalogue. But the catalogue, to be of use, must nearly confine itself to giving the name and the number of the object. And professors might do a useful work in writing essays, which they might even enlarge into volumes. This would be for use in the college or other libraries, and form a part of the training, qualifying students to use a museum in the way that is most helpful.

THE controversy on the restoration of Cossey Church has not thrown any particular light on the question of restoration of historical buildings. Restorations, putting aside the thought whether they are *bona-fide* works needed for preservation, or, on the other hand, quite manifest works of vandalism, have been, and are, continuously in progress, and will be. Within the last few days the wish has been expressed that Kirkstall Abbey may be restored as the cathedral of a future Bishop of Leeds. The idea smacks certainly of destruction, and nothing could satisfy the inhabitants of the British Islands so much as seeing the ruins preserved in their present state as public property. But it is quite possible when a new cathedral is to be built anywhere to design a Kirkstall Abbey, or any other historical

building, quite as accurately as a Kirkstall Abbey restoration could be made of the ruin. For one ruin, however, there are hundreds of the old historical buildings—churches, for instance—that are in use, and that have necessarily to be restored unless the country is to be turned into a museum of ancient buildings. And it is just here where the difficulty in restoration lies. No good can be done by trying to persuade the inmates of a house that the roof is not rotten when they know it is. No attempt has been made to recognise the weight of an important point in Lord GRIMTHORPE'S indictment, or contradict it, that the "preserved" system of the Society for Ancient Buildings has, in certain cases, resulted in destruction. The public cannot have faith in their instructors unless they are practical as well as theoretical. Learned societies live often chiefly on the prestige acquired by writing letters, issuing circulars, speech-making, &c. The Society of Antiquaries has a list of rules, and the Institute of Architects, as we are reminded this week, has its list of rules for the guidance of restorers. But these precious pearls of wisdom are likely to be useless unless the framers can show that a falling house will be kept from falling by a coat of paint. When a restoration is proposed, the lovers of antiquity have got themselves to thank if the public think they would sooner err on the side of destruction from repairs than destruction by restoration. *In medio tutissimus ibis* is an old world truth, and to have influence, societies as well as individuals must be practical.

THE subject of Stirling Castle was brought up this week at the meeting of the Town Council, and a motion passed that, as the Government authorities who have charge of the buildings had from time to time been making alterations and thereby destroying and defacing the antiquarian appearance of the castle, it should be considered whether action might not be taken with a view of preventing any further destruction or defacement. In support of the motion it was alleged that the old Parliament House had been turned into a canteen, and the armoury, which contained ancient Scottish weapons, had been taken away. It was also agreed that further action should be taken to secure that the public should have access to the places of interest in the castle. The town authorities have done well in looking to the interests of what concerns their town, and with representations made in the proper quarter there is no doubt they will succeed. The term "Government authorities" is an elastic one, and Government often does not know all that is done by its zealous subordinates.

A COMPETITION for a church which is proposed to be built at Birkdale Common has just been decided. The competition was a limited one, and the promoters had been able to secure the services of Mr. EWAN CHRISTIAN to assist them in the selection by acting as assessor. The decision of the building committee has resulted in the adoption of the designs of Mr. J. FRANCIS DOYLE, of Liverpool. The church is intended to furnish accommodation for six hundred worshippers.

THE annual report of the chief surveyor for the Hackney District Board of Works, Mr. JAMES LOVEGROVE, has a reference to carriageway paving. There cannot, it states, be two opinions as to the longer wear of granite paving than of wood, while wood is far more durable and much cheaper than macadam. The extra cost of maintaining wood paving as compared with granite is to a considerable extent met by the reduced first cost, while wood has the great compensating advantage of being so much less noisy than either granite paving or macadam. Granite 4 by 4 inch cubes would be far cheaper than macadam. Granite-paved roads have, however, the drawbacks of being noisy and slippery. The macadam requires renewal in from one to six years according to the traffic, and the extra cost of clearing the mud and dust is considerable. The broken granite margins alongside the tramways are very costly to maintain. The repairs now carried on with the 2½-inch broken irregular stones under the steam-roller quickly work away from the tramway paving, and the constant feeding involves an outlay which in a few years far exceeds the cost of proper paving.

### THE TRIENNIAL EXHIBITION AT ANTWERP.—II.

IT is evident from the foreign departments of the Antwerp Exhibition that in Germany, Holland, and France a fine picture does not necessarily obtain a purchaser on its first appearance. Several of the paintings in the galleries have gained commendation before now, but they are still on the hands of their authors. One of the most interesting of these is the *Scellement du Saint Tombeau*, by ALBERT BAUR, of Düsseldorf, which was suggested by the passage in Scripture describing the sealing of the tomb of CHRIST. The door of the sepulchre in the rock is closed, and the mark fixed by the priests and Pharisees takes the form of two strips of linen placed crosswise, with seals at the extremities. There is a contrast in the expression of the faces, ranging from the scepticism of the priests to the grief of the disciples. MAGDALEN is apart, and is being consoled by one of the MARYS. In the foreground and at a lower level than the tomb stand the Roman soldiers, with a few people who have come through curiosity or sympathy. In no city are the canons of painting for religious subjects more rigorous than in Düsseldorf, but M. BAUR boldly departs from them. That the figures are well modelled is not surprising, for the Germans are strong in draughtsmanship, but we see also an exceptional depth and harmony in the colouring. Yet this fine picture, which would grace the walls of any Christian church or a public gallery, is still in the market. Unless we are mistaken, M. BECKMANN'S *Luther at the Diet of Worms* is of still older date. The figures are of heroic size, and denote a vigorous hand, and, from the arrangement, the eye is attracted by the courageous monk in his dark robe, rather than by the gorgeous bishops, or the still more gorgeous grandees. This is essentially a monumental work, and at one time would have excited enthusiasm wherever the Reformation became a power. If there are pictures in the galleries which seem to have been intended for public buildings, but have failed to attain that distinction, as compensation we also find works which are more successful, since they are lent by Governments, and they must impart an interest to the Exhibition for English eyes, as works which are the result of public commission are unknown among us. One of these is M. ARPAD FESZTI'S *Golgotha*, which comes from the Musée National of Buda-Pesth. The crosses represented are of the T-form, and are so short that the feet of CHRIST and the two thieves almost touch the ground. This treatment becomes the more remarkable when seen in a country like Belgium, where great artists have perpetuated lofty crosses in their pictures. M. FESZTI represents the place of execution under the darkness which overspread the land, and this treatment seems far more fitting for the subject than the fierce light which illuminates the pictures of the *Crucifixion* by RUBENS and his followers. The disciples appear as very humble men poorly clad, and the work is one of the most natural and yet poetic illustrations of scriptural events. It shows also how far art has advanced in the East of Europe. From the same museum comes a subject of a very different class, viz. the *Bacchante* of M. JULES BENCZUR, which is a capital piece of flesh-painting, and with less obtrusiveness than is found in French works; a historical picture by M. SZÉKELY, representing the discovery of the body of King LOUIS II. in 1626; besides works in other departments. Whatever may be the shortcomings of the Austrian system of government, neglect of art cannot be reckoned among them.

The Galerie Royale et Nationale of Berlin contributes a still larger quantity of paintings. Militarism is flattered by portraits of commanders, such as Herr JANSSEN'S *Field-Marshal von Bittenfeld*, a realisation of a strict disciplinarian; but art and scholarship have also their representatives, among others, RANKE, the historian, and LUDWIG RICHTER. Landscapes, as well as figure-paintings, are under the patronage of the Government of Prussia, and whatever may be the subject the influence of military rule is evident. Everything seen is as exact as a line of soldiers on parade. Take, for example, the *Paysage Alpestre*, by the Comte VON HARRACH. The rocks could hardly be more accurate and rigid in a photograph. The light and shade are in proportions that seem to be calculated. The smuggler or poacher who is wounded to death lies on the ground in the most

effective spot, and the scale is determined by a figure in the foreground, who overhauls somebody's luggage, in which every article is depicted with fidelity. But in spite of the industry seen throughout, the picture is not satisfactory. It suggests that the figures as well as the surroundings stood still until the painter completed his work. In M. OTTO KIRBERG'S *Victim of the Sea* the same cold-blooded sort of narration is apparent. The drowned sailor appears lying on the floor of a room with gaily painted cupboards. The sorrow of the wife and the surprise of the spectators are put on canvas with a regularity that could not be surpassed in the official report on the subject, but we defy any spectator to be moved by the picture, and indeed one gladly turns attention to the painted woodwork of the background. M. HOFF'S *Baptism of a Posthumous Child* is another example of the peculiarities of Prussian art. The pastor might be a young and zealous corporal, and the mother and her friends are as subdued as so many recruits. Dresden at one time could turn out works that recalled beings with flesh and blood. M. JULIUS SCHOLTZ'S *Volontaires de 1813* is not of that class. The crowds who come forward to enrol themselves all contrive to keep their enthusiasm under control. Every man is well brushed and combed, but one can hardly imagine any spontaneity in the movement. Yet all the figures are as faultless in their way as the cast-iron architecture of Berlin. A similar spirit animates the landscapes. Is there no philosopher who will explain why Austrians and Hungarians, Dutchmen, Frenchmen and Belgians, or, in other words, why all the neighbours of Germany can paint figures that seem endowed with life, and which reveal the delight of the artists in the exercise of their skill, whilst in those portions especially of the new empire which are under the influence of power, no more than a mechanical sort of talent can be attained? It is only necessary to compare the portrait of MOLTKE, the strategist, with the astonishing picture of an Hungarian officer in order to see the difference between the art of Germany and other countries. One is rigid, but nearly lifeless, while the second figure seems to start from the canvas.

It is not possible to do full justice to French painting in the space that is available at Antwerp. There are, however, several works which are characteristic and remarkable. M. BONNAT'S sketch of JULES FERRY should be acquired for the use of students of art. The painter brings out his effects generally in broad masses of colour, but in his figure subjects the effects are heightened by a sort of hatching with the brush, which, it must be said, is not of much value. In the sketch at Antwerp the work is mainly done by hatching, or, in other words, by a very dry brush. We do not propose that M. BONNAT'S experiment should be imitated; but the sketch is useful, as suggesting how much can be done by a few strokes wisely directed. M. BOUGUEREAU'S *Baigneuse* is a side view of a figure with one leg resting on a rock: contrast to the flesh and the green of the background is found in a dark purple scarf. It is the sort of work which the artist turns out by the dozen; but, in spite of all the objections which are raised against his figures, no living painter can surpass M. BOUGUEREAU in beauty of line or simplicity of treatment. M. CABANEL sends three portraits, one being of the late M. ARMAND, the architect. M. JULES BRETON, who is more esteemed than ever, owing to the high prices obtained for his works in America, has three pictures, one being seven girls in white who are journeying to take part in a religious procession. It reveals the skill of the painter, who can treat subjects of this kind with a delicacy that is almost unique. M. DUPAIN, a young artist of great promise, has a study of his *Vénus Sédérale*, which is intended for the Observatoire of Paris. M. FANTIN-LATOURE sends two pictures which correspond with his lithographs of the *Damnation de Faust* and the *L'Or du Rhin*; it is difficult to say whether the paintings or the lithographs were the original expression of the artist's thoughts. The venerable M. FRANÇAIS, who is the NESTOR of landscapists, has three works, and happily they show that his love of nature and his skill in rendering the poetry of landscape are unabated. M. GÉROME once more gives a sketch of a nude girl in an eastern bath under the title of *Vapeur humide*, the figure being seen through the mist.

M. JULES LEFEBVRE this time has abandoned DIANA and her nymphs, and displays new powers in his *L'Orpheline*, a peasant girl with an old woman in a church. M. LE ROUX has a few small pictures of classic subjects, the *Vésuve* being little more than indicated on the canvas. M. ALBERT MAIGNAN's attempts to become an interpreter of English history have not found favour with his countrymen. His *Death Chamber of William the Conqueror*, which some years ago was admitted to the Salon, remains unsold, and is not likely to remain in Antwerp. The painter's genius is not sufficiently strong for epic themes. Among the works lent by the French Government is one of M. ROPS, the copper-plate printer, who is seen at his press in a garret scrutinising a proof on vellum. It is the work of M. PAUL MATHEY, and should bring many commissions to the artist.

As was to be anticipated, the Belgian artists, and especially those living in Antwerp, occupy the larger part of the walls. It is easy to mark a difference between the general style that prevails in Antwerp and Brussels, the artists in the latter city coming nearer to their brethren in Paris. There is, however, uncertainty about the class of subjects which are most pleasing to the public. When an artist like M. OOMS gains a commission from the Government to adorn the Cour d'Assises with such a noble work as his *Innocence Protected by the Law*, he can give most of his attention to historic subjects. But with other artists the case is otherwise. There is M. VAN DER HAEGHEN, for instance. He is known in England as a painter of history, but in the Antwerp Exhibition he is represented by two triptiques which are devoted to the fishing trade of Blankenberghe. They are painted with great realistic power, and will be valuable as works of art and as records of an industry which at present is picturesque, but is likely to become prosaic from the increased employment of steam trawlers.

As there are over fourteen hundred works in the Exhibition, it would be vain to give more particulars concerning them, but the English student of painting would do well to pay a visit to Antwerp just now, and he may be confident that he will have no crowds to impede his investigations.

#### BIRMINGHAM SCHOOL OF ART.

THE distribution of prizes to students of the Birmingham Municipal School of Art was made by Alderman Kenrick on Thursday evening last week.

In the course of an address to the assembled students and their friends, Mr. Kenrick observed that there was no other town in the kingdom which could boast of nine branch schools in connection with a central School of Art. Last year as many as 880 students were working in those branch schools, and he ventured to anticipate that the number would soon reach 1,000. As a matter of fact, the present autumn return showed the number to be 1,244. The awards were distributed amongst all the schools receiving aid from the Education Department, whether they were Board schools or were known as denominational schools, and in proportion to the number of the scholars. When this scheme was promulgated it was estimated that the number which would probably be added to the branch schools was over 800. At the present time, in the second year of its working, the number was 330, so that they were well on their way towards the final adoption of the scheme. The classes of children drawn into the schools were characterised by a very high standard of intelligence and industry, and if he was not much mistaken they had materially added to the successes in the year's examinations. The committee had always had in view the consideration that they would not fully accomplish their work unless they extended the operations of the central school, as a directing and inspiring influence, throughout the art teaching of the town. They felt that, with all the great advantages they had in that school, with all their talented teachers, and with their most able, zealous, and talented head-master, who had the widest experience of any head-master in a School of Art in the kingdom, with all the appliances placed at their disposal by the liberality of the burgesses, it would not satisfy the conditions of the case until they had made the influence of the central school thus felt, and the ratepayers would not reap a full reward for their generosity. At the same time, by a wise decision of the governors of King Edward's School, a connection which had existed for many years with only partial interruptions between the schools of the foundation and the School of Art had now been consolidated and settled on a lasting basis. Not only were the advanced students under that foundation sent to the central school for their art education,

but all the head-masters had the right to call in the head-master of that school to consult with them as to the methods employed in their schools, and to give them the advantage of his experience and knowledge. Seeing that this had been done, and that the School Board had placed at the disposal of the committee their classrooms for the extension of branch schools, the committee made an approach to them, and formed a scheme which, in the nature of things, would meet all the requirements of the case and would be of great advantage to all the students under the Board. All the male pupil teachers and candidate pupil teachers, instead of being taught, as they had hitherto been, without any connection with the School of Art, would be sent up to that school, and would be taught by masters on its staff. That was one important link in the chain. Besides that, however, three teachers of the school had been appointed as inspectors of all the drawing teaching in the Board schools, and their duty would be to give model lessons pointing out what experience had shown to be the best method of teaching. They would also report upon the work done, and keep the central school in touch with it. Their reports would be sent to the committee of the School of Art, and forwarded by them to the School Board. Last year he discussed the probable effect of the Technical Education Bill then before Parliament on the art instruction of the town, supposing it should pass unamended into law, and he deprecated a disturbance of the existing condition of things, under which the responsibility of the art teaching was accepted by the Town Council; and he ventured to hope that, whatever form the Bill might assume, the School of Art and the School Board would find a way of working harmoniously together. One other development there was, not only important in itself, but to be welcomed as a herald of better things in art manufacture and its connection with the School of Art. In May last the committee received a communication from the Birmingham Jewellers' and Silversmiths' Association, in which the association proposed that the School of Art should open a class or classes for the instruction of youths between twelve and twenty years of age engaged in the jewellery and silversmith's trades. One condition of the proposal was that the classes should be carried on in separate rooms by distinguished head-masters, and with a definite line of study, preparatory to the practice of artistic design suited to the trades mentioned. The fees were to be paid half by the association and half by the employers, and the association guaranteed at least forty students. The committee gladly recognised the willingness of these manufacturers to make a connection between their trades and the School of Art closer than any which had subsisted in the past. It had been one of the chief discouragements of the committee that they had hitherto failed to enlist in the way they desired to do the assistance and attention of the art industries of the town; and one of the principal justifications of the Town Council in establishing that school had always been stated as the fact that its operation on those industries would greatly add to their prosperity. He need not say, therefore, how gratified they had been to receive this proposal; and to find that the class, instead of opening with forty, had opened with ninety-five students. He hoped that the success of this scheme would be a cause of encouragement to employers in other art industries, moving them to go and do likewise. In Paris the art manufacturers made it conditional that their apprentices should study in the art schools, and they reckoned that study as a part of the regular work of the day. When they did that in Birmingham he was satisfied that it would be of the greatest advantage both to employers and employed, and so to the general prosperity of the town. The number and variety of the applications of art to Birmingham industry could hardly be exaggerated. Birmingham, more than most towns, should call in the assistance of the artist; and therefore his appeal had a peculiar importance and weight.

In summarising the results of the science and art examinations conducted in Birmingham during the past year, Mr. Kenrick said that the third-grade passes in the central and branch schools had been 417, against 367 last year, and in the branch schools alone 59, against 32. The failures had been very few. The second grade elementary prizes principally concerned those whom he was addressing, but it was impossible to compare the results of this year with those of previous years, because the Department had altered their regulation. In previous years there had been two divisions, the "excellent" and the simple "pass," and so much apiece was allowed on a number of drawings which were sent up. This year they had no longer received those drawings, and they had regulated the passes so as to include apparently some who were before excluded. At all events, they had divided the successful candidates into three groups—excellent, first-class pass, and second-class pass. The management of the school was led to believe that the "excellent" was a rather higher examination than before, and the "first-class" rather higher than the old "pass." However, he had not been prepared for the enormous increase in the number of passes which had taken place. It was, as a fact, almost double that of former years, and in the branch schools it was more than double. He could only sup-

pose that a number of drawings sent up in past years had been very near the old standard of pass, or that the work of the year had improved, or perhaps both. The total number of passes in the second grade had been 1,189, as against 655 in 1887; at the branch schools alone the number had been 754, as against 342, and there had only been 9 per cent. of failures, against 40 per cent. in the previous year, with 11 per cent. in the branch schools, as against 41 per cent. A summary of the third and second-grade examinations showed 1,606 passes, against 1,022 in 1887, and that the failures had been at the rate of 35 per cent., against 53·86 per cent.; 150 students had received third-grade prizes, as against 152 in the previous year, and 7 students in advanced class had been similarly honoured, as against the same number. That branch of the work by which the teachers of the future were prepared had sent up from the central school 152 examples, as against 101 in 1887, and all of them had been accepted as qualified to receive a certificate. From the branch schools, which were supposed to be elementary schools, 21 such works had been sent up and accepted.

He wished that his voice could reach the builders and machinists of the town, asking them why they could not use a little more freely the facilities which were given at these branch schools for teaching building and machine construction, and practical, plane, and solid geometry. He was sure it was only necessary to direct their attention to those facilities, in order to find them willing to avail themselves of those branches of technical instruction. In comparing the results of Birmingham with those of other towns he was a year behind. The third-grade passes of Birmingham last year were 334, or 54 per cent. of the whole number; of Glasgow 100, or 20 per cent.; of Leeds, 33 only; of Manchester, which had a very important school, and was a dangerous competitor, 110 only, or 18 per cent.; of Sheffield 79, or 20 per cent. The third-grade prizes of Birmingham were 115 in number, or 18 per cent. of those presented; of Glasgow 56, or 11·33 per cent.; of Leeds, 18; of Manchester 63, or 10·5 per cent.; of Sheffield 26, or 6·5 per cent. The average of passes in 209 schools and 24 branches was 8·6 per cent. of the students sent up, and of prizes 2·8 per cent.—in each case one-sixth or less of the percentage achieved in Birmingham.

The awards in the national competition were not quite so pleasant to contemplate. This year Birmingham had only received 30, against 47 in 1887 and 28 in 1886. Of these 30·19 were in the subject of design, which was an increase on the previous year, when they had 14. But Manchester had 53 such awards, South Kensington 22, West London and Glasgow 19, Lincoln 14, Nottingham 12, and Edinburgh 10. A rather remarkable and painful circumstance was that Birmingham received no award for painting or drawing from the figure. Now they had always flattered themselves, and they had been justified in doing so by the awards given in previous years, that the figure was one of the strongest subjects in their classes. Last year they received eighteen awards in that subject—two silver medals, four bronze medals, and fourteen book prizes. If they had received a similar number this year their awards would have been forty-eight. What was the reason of the falling off? Was it a loss of teaching power and skill, or of ability on the part of students? Had there been any deterioration in the quality of the work? He was a layman in these matters, but he answered those questions without hesitation with a most decisive negative. It seemed from the report that they desired to see a real background behind the figures, and they protested against "the confusion which has arisen in some places, and in particular at Birmingham, between the kind of work necessary and desirable in a study from nature and that which may be allowable when composition in the treatment is necessary." They, as students, thought they had been complying with these conditions, but it appeared that they had not fully understood them. Therefore they had taken steps to ascertain from the Department exactly what its requirements were, and it would be their study—as it was their interest—to comply with those requirements, if, by so doing, they ran into no danger of stamping out all originality from the masters and students. If it should turn out, however, that the style of painting was condemned because it was not the precise style which approved itself to the examiners, as far as he was concerned he would protest against what he would venture to call any such artistic bigotry. It would mean an attempt to conform all students to one style, which was not a national style, and would be injurious to the development of a national and spontaneous style of art. He hoped that that was not the interpretation to be put upon the opinions of the examiners. He did not attempt to disguise the feeling by which he was actuated—that the schoolmasters and the students had been harshly dealt with. He thought that they ought to have had a more direct intimation if their methods were so vicious and deserving of such severe censure. They should have been told in plainer terms what their failings were. They had gone on in the dark, knowing that they were doing their best, and thinking they were doing very well. No one who looked at the paintings and drawings from life in the school would come away, what-

ever his opinion of style, without a very sincere respect both for the teachers and for the students who produced those works. Those very students whose studies from the life had been rejected had received awards from the Department for decorative panels, in which they had used the knowledge they gained by such life-studies. In those panels they seemed to him to show a great originality and very considerable knowledge of the resources of art. Such qualities the examiners could not pass over, and he was glad the students had received rewards for them, though not in proportion to their merits.

The head-master, Mr. E. R. Taylor, referred to the Technical Education Bill, expressing regret that the clauses which provided for manual training as part of the school work of young children had not been made law by a special Bill to themselves. Later in life the only things of value to the workman which could be imparted in schools were such principles and practice of science and art as they could apply in the workshops. The great hindrance to this application of the workman's knowledge was want of opportunity caused by commercial considerations. The London Society of Arts was making efforts to stimulate workmen and employers in this direction by the offer of very valuable prizes to workmen for their work. The potter on the wheel and the glass-blower at his furnace too often had their early art instincts crushed out of them by the conditions of manufacture. It was sad to see a potter who spent fourteen of the best years of his life on the thrower's wheel to learn his trade, and developing a delicacy of eye and hand superior to that of most artists, ground down by the conditions of manufacture and the providing of daily bread, until his ambition had to be satisfied by producing 72,000 cups of exactly the same pattern in one week; or the glass-blower, with no opportunity for seizing and developing those artistic hints which the very processes of manufacture were continually presenting to him. Birmingham trades, such as those of glass-blowing, hammering of metals, jewellery, glass-painting, &c., however much they might be hampered by trade conditions, were happily not so much under the demon power of machinery as to render impossible opportunities for the artistic and technical development of the workmen, and now that the jewellery and glass trades were making such efforts for the better technical education of their apprentices they might reasonably hope that opportunities would be made available to workmen. As regards the design, that was based on a close and reverent study of nature and a knowledge of the work of the past, and the laws, rules, and motives which had been evoked out of this history; the work itself must be of the man and of the time. Three giants bound them in their doing: the material, the purpose, and the limits of our powers. These also were the limits of conventionalism; all other conventionalism being affectation, or the slave bonds of precedent. The finest work of the past and the present grew from a sense of expression, a feeling for beauty of hue, and a reverent love of colour. This was designing in the highest sense of the word, but in how much of the clever and dexterous work of to-day were these things absent? Scraps of natural forms, such as flower foliage, figures, &c., whether copied direct from nature or from books, and indiscriminately applied to objects of utility, were in no sense designs, nor were scraps of recognised ornament similarly applied. One sometimes heard it said, "We only want new shapes, for we have plenty of ornaments to stick on;" but such men forgot that ornaments were not necessarily art, and that too often they were a cloak to hide the hypocrisy of bad work.

## INSURANCE OF WORKS OF ART.

A REPORT in the form of a Blue-book is to be issued by the executive committee of the Manchester Jubilee Exhibition. With regard to the care of the fine art works, the committee state that the enormous value of the works of art entrusted to the care of the committee naturally caused them much anxiety. From the outset it was apparent that it would be impracticable for the committee to undertake to insure the whole of the pictures and drawings against damage by fire. Estimated as these roughly were at 2,000,000*l.* value, it will readily be seen how impossible it would have been to place such an amount with insurance companies, or, at least, to pay even a reasonable premium for the protection. The committee, therefore, in the first instance, gave instructions to the architects to devote special attention to the construction of the fine art galleries, so as to minimise, as far as possible, risk from fire. These were accordingly placed in a position remote from the machinery section, and were separated from the main building by a 9-inch brick wall. Internal communication was by iron doors only, standing in concrete beds. The three communications with the main buildings were also by iron doors. All these doors were specially made by Messrs. Chubb & Son, of London, and formed an exhibit in themselves. The whole of the woodwork throughout the buildings was painted with fire-proof solutions. Numerous appliances for fire extinction were

placed in the galleries and in their immediate vicinity. These are more particularly described in the report of the Fire Prevention and Appliances Committee. Notwithstanding the fact that no machinery in motion and no steam power were used in the main buildings, some of the insurance companies, on being approached, quoted similar rates to those charged at the Edinburgh and Liverpool Exhibitions, where the materials used in construction were of a much more hazardous description, and where no special care had been observed in excluding the elements of danger; 31s. 6d. per cent. was at first quoted as the rate for the fine art galleries and their contents. After a careful inspection of the buildings when they were so far advanced as to admit of a proper estimate being formed of the risk, 21s. per cent. was named. Thereupon the committee decided not to insure the buildings at all. Through the liberality of a large proportion of the contributors of works of art, the amount for which the committee were obliged to seek protection was limited to 630,000*l.* The majority of the companies firmly adhered to their quotation of 21s. per cent. for the insurance of the pictures and drawings. A few of the leading companies, however, declined to join the "ring," and accepted the committee's offer of amounts at 7s. 6d. per cent. Lloyd's underwriters also came to the committee's assistance. The committee were fortunate in securing the advice and experience of Mr. Thomas Land, surveyor in Manchester to the Phoenix Fire Office. That gentleman prepared a description of the buildings and drafted a form of policy which were ultimately adopted by all the companies placed on the risk. After protracted negotiations, the committee arrived at the conclusion that they must either accept the companies' terms and pay the premium, which was now reduced to 15s. per cent. (this rate to apply to all the insurances already effected), or adopt some other means for obtaining the necessary protection. It was, therefore, unanimously decided to form an Underwriters' Association among the members of the committee and their friends for the purpose of affording the additional security still required. A private circular was accordingly issued. This arrangement was effected entirely on a commercial basis. The terms of the underwriting deed were settled by Mr. McLachlan, counsel to Lloyd's Association, and the subscribers received the premium of 7s. 6d. per cent. in due course. The total amount subscribed for was 246,500*l.* By means of this arrangement the committee were enabled to adhere to their original resolution, and declined to pay more than 7s. 6d. per cent. for fire insurance. The committee were also obliged to effect insurance with Lloyd's to the extent of 678,670*l.* to cover works of art against all risks (except fire) while in transit to or from the Exhibition, or in the art galleries. Of this amount about 500,000*l.* was insured at 2s. 6d. per cent., the remainder being placed for the most part at 5s. per cent. The statuary was not insured. The gross amount paid in insurance premiums was 3,376*l.* 17s. 3d.

### RESTORATION OR DESTRUCTION.

THE following letter to Dr. Jessopp in reference to Cossey Church appeared in the *Times* of Monday, the writer dating from Costessey on September 7:—

"My attention has been drawn to a letter written by you to the *Times* of Monday last upon the above matter containing one or two inaccuracies, due I have no doubt to the imperfect knowledge which you say you had of the church as it existed, but which I think should be corrected in justice to myself, as one taking a principal part in the nave restoration, and to others who also took part in the work. 1. The whole of the heads of the nave windows were built up with bricks and rubbish, and the tracery destroyed, when we commenced operations, and there existed only a very small portion of the jambs and mullions, these being so bad that sufficient could not be obtained to form one window out of the six. 2. The old jambs and mullions have been as closely followed as possible, and the tracery now inserted is correct in period. The work was executed in moulded white brick made here, and for which the place is so justly celebrated all over England. This is equally as durable and more economical than stone, which is a most important matter when you consider the enormous difficulty in raising funds for the work in a parish situated as this is. 3. The old roof was absolutely rotten and was full of holes, through which birds and rain entered at will, and could not be repaired. The present one is exactly similar in construction, with the addition of a little more moulding to the principal rafters, a decided improvement I venture to think. 4. The seats in the church consisted of a few benches, the greater part of the floor being occupied by square, high box-pews, in most inconvenient and irregular positions, with a 'three-decker' pulpit and sounding-board complete, almost in the centre of the nave against the south wall; the whole church being heated (!) by a close stove, with a long iron chimney going nearly half-way across the floor. The seats have been replaced by very fine

convenient open benches throughout (a gift to the church). A very good pulpit (also a gift) has been fixed in proper position, and the whole church has been heated by hot water. With these facts before you, I venture to think that you would not wish us to be 'linked' with such a past—a past which, although not 'brutally obliterated,' has been wisely removed and a better and more beautiful present substituted. So far as the chancel is concerned, I quite agree with the remarks in your letter. I have done my utmost to prevent the wanton destruction of the roof and windows, with what result I hope soon to see.—I am, yours obediently,

"T. H. B. HESLOP."

The following are extracts from various letters on the subject:—

Mr. R. Milburn Blakiston, F.S.A. secretary, writes to show that the Incorporated Society for Promoting the Enlargement, Building, and Repairing of Churches and Chapels—as instanced by this case—is not unmindful of what is due in matters of restoration. An application for aid from the Society towards the restoration of Cossey, or Costessey Church, was received in March 1887, accompanied, in accordance with our requirements, by the plans and specification. In due course these were submitted to the committee of hon. consulting architects, by whom grave exception was taken to much of what was proposed. After considerable correspondence on the points objected to, the committee requested Mr. Ewan Christian to inspect the church. He did so, in company with the vicar and local architect, and advised what course should be taken. His report fully confirmed the objections already raised. Upon receiving an assurance from the local architect that he had found the roof-timbers to be rotten, the following decision was sent to the vicar on November 3, 1887:—"If the roof is so decayed as the architect states, it must necessarily be renewed; but as regards the windows it would be better to repair one at a time, preserving the old stone of the jambs, &c, still remaining, rather than to carry out the work in terra-cotta as first proposed. As regards the reseating, also, the old Norfolk arrangement of the benches should certainly be preserved." The Society voted a small grant conditionally upon the plans being carried out in accordance with these requirements. It remains to be seen whether a certificate can be given showing that this has been done.

Mr. Anderson and Mr. White, of the Royal Institute of British Architects, state that the papers of general advice, referred to by the *Times* as having been published by the Royal Institute of British Architects a quarter of a century ago, have been recently revised and enlarged. They are entitled "Conservation of Ancient Monuments and Remains" and "Hints to Workmen Engaged on the Repairs and Restoration of Ancient Buildings," and may be obtained at the office of the Institute by anyone requiring such information.

Mr. Evans, the president of the Society of Antiquaries, has read "with no little amusement, but without surprise, Lord Grimthorpe's outburst. Although I am apparently selected as the special object of his vituperation, I am 'not careful to answer him in this matter,' nor am I desirous of imitating his style of controversy. The question of what is real and judicious restoration is one on which the educated public is competent to form an opinion, and my only object in now writing is to inform your readers that copies of the memorandum of the Society of Antiquaries on the subject of church restoration can be obtained gratuitously on application to the secretary at Burlington House."

A correspondent is gratified to find that the Society of Antiquaries is now alive to the destruction which has for so many years been going on under the name of "restoration":—"It would, however, be interesting to learn why the Society has so long delayed its protest. If it had taken up the question a generation ago much of the mischief that has been done might possibly have been prevented. In respect to churches, there can be no question that the prime delinquents have been those who should have been their stoutest protectors. Dr. Jessopp may wail and lament, but I doubt if he would find many of his brother parsons in the county of Norfolk who would agree with him in the matter of Cossey Church. The truth is that what is primarily required to bring about a better state of things is some reform in the system under which faculties are obtainable. At present there is little or no control over those who desire to make alterations, however destructive such alterations may be. A notice has to be posted on the church door for a certain period to give people an opportunity of objecting, and then, if nobody objects, and all the legal formalities are observed, the faculty is granted. A clergyman once told me very frankly that he waited until the only person of importance in his parish who was likely to interest himself on the subject had gone away for his summer holiday, and then posted the notice and obtained the faculty in his absence. What seems to be wanted is some body in each county or diocese to whom all schemes for repair or alteration should be submitted, and by whom they should be approved before any faculty is granted or any work undertaken. Whatever authority may be constituted, however, one

thing is certain, and that is that the persons composing it must not be such as would be subject to the dominating influence of professional architects. They must be able to hold their own against the gentlemen under whose guidance, hitherto, so much mischief has been done. It might be invidious to mention names, but it is perfectly well known that there are plenty of well-qualified persons in the country who would form most efficient boards of control over all projects of restoration. On certain points, such as structural stability, the boards would naturally call in the aid of professional experts."

Mr. Evans replies to this:—Your correspondent inquires why the Society of Antiquaries has so long delayed its protest with regard to church restoration, and suggests that if the question had been taken up a generation ago much of the mischief that has been done might possibly have been prevented. Allow me to inform him that in May 1855, when the late Lord Stanhope was president, a memorandum on the subject was published by the Society, a copy of which I enclose. From that time until now the aid of the Society has been frequently invoked to arrest, if possible, the hand of the destroyer, and on some occasions not without success.

On Croyland Abbey Mr. John T. Markley writes from Eastbourne:—Churchmen, students of history, archaeologists, and educated people generally will regret to learn—as I have just learned from the local rector—that the famous old abbey at Croyland is in danger of speedy destruction. Situated in the great plains of South Lincolnshire, nine miles north of Peterborough, the remarkable abbey at Croyland is a conspicuous monument of old monkish times for many leagues around in the very fertile meadowy levels of Eastern England. From a considerable personal experience of the locality and the abbey records, I may inform those who only know Croyland Abbey from books and pictures that it is one of the most interesting parish churches in the land. To detail the wonderful Mediæval history and fabric features of this fine abbey would be to presume too much upon the lack of information of the travelled or the home reader. This I will not do, as the history of Croyland is the history of the hill-less Fenland for centuries past, rich in legend and the folklore of religious story. The Rev. T. H. Lebeuf, the present rector, tells me that 3,000*l.* is needed at once if the abbey is to be saved as a splendid ruin, which is also available for the only parish church on the borderland of the Fens, and where the concentrated rural population is over 2,000 people. The abbey, a survey just made shows, must be immediately dealt with or it will become a developed ruin without the facilities for Anglican worship. This practical need intensifies the poetic argument and appeal for prompt restoration, and I would, through the press, ask the public to send the rector of Croyland Abbey assistance, and so save a local church which is a national monument.

### BAPTISMAL FONTS.

AT the second meeting of the Cumberland Archaeological Society held in Carlisle on Thursday last week, a paper was read by the Rev. J. Wilson, vicar of Dalston, on "The Baptismal Fountains of the Deaneries of Carlisle," including St. Paul's, Crosby-on-Eden, Scaleby, and Bowness-on-Solway. The history of fountains in England since the Reformation, he said, was not a bright one, and if the time ever came when the survey of our territorial limits was complete, it would be found that the diocese of Carlisle furnished no exception to the general rule. There were many fountains up and down the diocese which could not lay claim to much antiquity, but still they had been used for years, some of them for centuries, and were now to be seen in rectory gardens.

As to the fountain in St. Paul's Church he had a sad story to tell. It was originally in the nave of the cathedral, but was transferred to St. Paul's, and placed on the north side of the west door when that church was completed in 1870. According to the Rev. F. Richardson, a former vicar of St. Paul's, when the new St. Mary's Church was built, the architect of the new church presented the fountain now in that church; and hearing that the late Mr. Mounsey, the then diocesan registrar, had either removed, or intended to remove, the old fountain into his garden, he (Mr. Richardson) in order to save it from the improper use to which it had apparently been intended to put it, and to preserve a relic of old St. Mary's in which he believed generations of Carlisle people had been baptized, applied to Dean Close to have it removed to St. Paul's. His request was complied with, and, with one exception, what had been sculptured on the fountain was altered into the sacred monogram. The exception was a dove with a branch in its mouth which they would still find there. Whilst undergoing the "repair" mentioned by Mr. Richardson, the form of the fountain was changed from a hexagon into an octagon, very slightly lop-sided; and until he saw stronger evidence to the contrary, he should believe that it belonged to the Late Decorated period, and was probably given to the parish church by the Corporation of

Carlisle, or by the bishop of the diocese about the year 1360.

The fountain in the church at Bowness-on-Solway was a rich specimen of Early Norman work, standing near the principal entrance in the centre of a square Georgian pew. The bowl, the only original part, was, like Crosby-on-Eden, square, with corners chamfered to meet the stem. The raised ornamentation, with which the whole bowl was covered, was rude, well defined, and might have symbolic meaning. On the west side it was quite plain that they had the vine, a figure of the Church, springing from three interlaced circles, the sacred symbol of the Holy Trinity, and the whole signifying very appropriately the nature and effects of the Holy Sacrament of the font. Interlaced bands run diagonally on the north side, the intersections forming a lozenge panel filled alternately with nail-head and round pellets. On the remaining sides and corners there was an irregular and floriated ornamentation. The moulding round the lip, very much broken, was now patched with pieces of red sandstone. It had, of course, the characteristic lead lining and the drain. It was not a little curious that Bishop Nicholson omitted to mention the fountain when he visited Bowness on July 2, 1703. For that matter, small use the parishioners could make of it had it been above ground. "The rector (Mr. Gerard Lowther) has removed all his goods to Colbyleathes, near Appleby, designing to fix his family there; and his curate is also retired into Lancashire: so that on Sunday last they had no service: nor do they know when they shall." The Rev. S. Medlicott informed him that, according to local tradition, the bowl of the fountain was dug up by one John Wallace, the then sexton of Bowness, when making a grave in the beginning of this century. This seemed probable enough, as it was seen by the Messrs. Lysons in 1808 "lying in a garden near the church." It was soon taken (said Mr. Medlicott) from the churchyard into Mr. Hodgson's garden, where it was well remembered as standing for many years in use as a flower-pot until presented to and put by him into the church. There could be no doubt that it had been buried by some pious person to save it from desecration or more probably destruction in times when every sacred relic of the Church Catholic had been set at naught. In 1848 the Norman bowl was placed by Mr. Hodgson on the octagonal stem with a square base.

The fountain at Crosby-on-Eden was Norman with a square bowl, with the lower part of the corners chamfered to meet a cylindrical stem. The whole rested on a square plinth, was of good red sandstone, and had a drain. The bowl bore evident marks of ill usage, but one wondered that it was in such good preservation when one remembered that Crosby Church was north of the Eden, and exposed to hazards during the Border feuds. When Bishop Nicholson visited in October 1703, he found the fountain "pretty well." It must have fared worse since, probably in 1745, when, according to local tradition, the rebels stabled their horses in this as well as Stanwix Church. At all events the bowl was scored with deep lines, and one side had been manifestly used as the parish whetstone. The fountain at Scaleby was supplied in 1707, and consisted of an octagonal bowl and base with a circular stem. The bowl was shallow without a drain, and the whole fountain was of a filthy yellowish colour. On one side there was a wedge of iron leaded into the bowl which served probably as a book rest.

### TESSERÆ.

#### Architectural Drawing.

G. E. STREET.

THE art of drawing, as practised by an architect, ought to be subservient entirely to the object in view. The object is the representation on paper of what he wishes to build, with such exactness and clearness that no workman shall have the slightest difficulty in carrying out precisely his intentions. There is, in the first place, therefore, nothing so much required as painstaking accuracy in your work. It is a habit which, once acquired, is never entirely lost, and without which the drawing properly of intricate works, as, for instance, designs for details of all elaborate stone or metalwork, is hardly possible. I know no means so good of attaining this power as the sketching and measuring of existing buildings, or portions of buildings, and then drawing them out to scale and in ink, with every joint of the stonework, every feature of the detail, carefully and accurately shown, and without any tint or colour upon the drawing, or any etching on its face of lines, which may look picturesque, but which do not exist in the original. I desire especially to warn you against wasting much time in trying to learn to put the conventional architectural tints in monochrome on your drawings, which would be of no possible assistance to any scientific person in aiding him to form a judgment of a design, and which seem not unfrequently to favour the careless delineation of details in the first place, because it is obvious that, if the drawing is to be covered

everywhere with tint, the pure and true drawing of detail will all be obscured and destroyed. I believe most emphatically that this mode of "getting up" drawings, as it is called, is more thoroughly detrimental to the cause of real art among the students than anything else I can name. It leads them to substitute shadow for substance, and to waste precious time in producing effects which, at the best, are not beautiful, and in no case are useful. It encourages them in the too popular delusion that an architect's business is to make drawings, and not to erect buildings. And it seems always to involve an attempt to impose upon the unlearned by tricking up drawings of buildings to look pretty, instead of attracting the learned by showing that the beauty of detail and accuracy of proportions and details of construction have really been studied and cared for. For the same reason the art of drawing shadows is one which you may just as well leave to people whose business it is. The architect's business is to cast shadows and create them, not to draw them. His eye ought to be trained to calculate perfectly, when he draws a hollow in the midst of a succession of mouldings, what its relative force will be, but scientific shadow drawing will not help him in this. He may reckon also very properly upon the production of masses of light and shade where his design most wants relief, but this he can do in his mind and by a glance of his eye quite as accurately and usefully as if he developed the lines of his shadows painfully athwart the elevations of his building, without the slightest reference to the somewhat important question whether the aspect of the building will ever allow the sun to shine upon it. But whilst I entirely counsel you not to trouble yourselves about making tinted elevations, I wish in no degree whatever to deprecate the most artistic sketching or drawing, or use of your pen or pencil. I strongly advise all students to spend a certain large proportion of every year in drawing from buildings themselves details of every portion. There is no other mode in which hand and eye and mind become so rapidly and so truly educated.

#### Arabesque Decoration.

A. POYNTER.

It is remarkable that the only mention Vitruvius makes of this style of decoration is in reprobation of it; but he describes it so accurately that the passage is worth repeating, if for no other reason. After pointing out and classifying what he considers legitimate objects for painting walls, such as architectural compositions, landscapes, gardens, and sea-pieces, the figures of the gods, and subjects drawn from mythology and the poems of Homer, he proceeds thus:—"I know not by what caprice it is that the rules of the ancients (observe that Vitruvius looks up to the ancients in his day—that is to say, to the Greeks), who took truth for the model of their paintings, are no longer followed. Nothing is now painted upon walls but monsters, instead of true and natural objects. Instead of columns we have slender reeds, which support a complication of flimsy stems and leaves twisted into volutes. Temples are supported on candelabra, whence rises, as from a root, foliage on which figures are seated. In another place we have demi-figures issuing from flowers, some with human faces, others with the heads of beasts—all things which are not, never have been, nor ever can be. Such is the influence of fashion that, either through indolence or caprice, it renders the world blind to the true principles of art. How can it ever be supposed that reeds can uphold a roof, or candelabra a whole building, that slender plants can support a figure, or their stems, roots, or flowers put forth living beings. Yet no one condemns these extravagances; on the contrary, they are so much admired that no one cares whether they be possible or not, so much do mankind render themselves incapable of judging what is really deserving of approbation. For my own part, I hold that painting is to be esteemed only so far as it represents the truth. It is not sufficient that objects be well painted; it is also necessary that the design be consonant to reason, and in no respect offensive to good sense." Pliny also laments that in his time gaudy colouring and quaint forms were held in greater estimation than the real beauties of art. But with all deference be it spoken, there is another side to the question, which these great authorities seem to have overlooked. Conventional decorations of this kind were within the reach of thousands to whom paintings in the higher branches of art were inaccessible, and a more general diffusion of taste must have been at once the cause and effect of their universal adoption—how universal the remains of Pompeii reveal to us. If we examine the ancient arabesques independently of these prejudices, we shall find endless beauty, variety, and originality; graceful details, combined in consistent and ingenious motives and analogies, and great skill and freedom in the mode of execution. We shall also find reason to doubt whether the introduction of the arabesque style really had the effect of discouraging painting of a higher class, since even at Pompeii poetical compositions of great merit are frequently combined with the lighter groundwork of the general decoration. However fanciful and capricious the arabesque

style may at first sight appear to be, there can be no doubt that it may be treated according to the general fixed principles of art, and that the artist will be more or less successful as he keeps these principles in view. A due balance of the composition is essential, so that the heavier parts may sustain the lighter through every gradation, and there must be such a disposition as not to cover too much or too little of the ground. Unity of design is to be studied in a connection of the parts with each other, and in the harmony of the details and accessories, which ought as much as possible to tend to some general aim. It adds very greatly to the value of this species of decoration, when it can be made by these means significant as well as ornamental. It would lead us much too far to enter upon the subject of colour; but it may just be observed that in the ancient decorative painting the balance of colour is strictly attended to. Their walls usually exhibit a gradation of dark panels in the lower part, a breadth of the most brilliant colours in the middle and principal division, and a light ground thinly spread with decoration in the upper part and in the ceiling, an arrangement dictated by the natural effects of light and shade and reflection. As lightness and grace are the peculiar attributes of arabesque, the foliage which forms its most fertile resource should never be overloaded, its details and modes of ramification ought to be drawn from Nature.

#### Sculpture in the Chapel of Henry VII.

R. WESTMACOTT.

A very remarkable series of statues will be found in the chapel of Henry VII.—works that, in certain qualities, may challenge comparison with the production of any school. They are of unequal merit, but the best of them are fine examples of the success of the Mediæval artists in treating drapery, and in the impressive simplicity of *pose*, in single figures. At the same time they preserve all the distinctive characteristics of the Gothic school, so carefully and so curiously maintained during the whole period of its existence. The works referred to constitute a portion of the decoration of this exquisite architectural triumph of the sixteenth century. The nave of the chapel is divided from the aisles by four arches on each side, and similar arches divide it from five small chapels at the east end. Immediately under the arches, and extending entirely round the chapel is a range of demi-angels, crowned in high relief. They are rather grotesquely treated; some are draped, some are represented with their bodies feathered, and, generally, they have rich, curly hair. Their function is to support, on shields, the royal devices of Henry VII.—the rose, portcullis, fleur-de-lis, &c. Over these angels are octangular pedestals and niches, enriched with tracery and foliage, containing statues about 3 feet high of saints, martyrs, and other venerable persons. There is here great variety of action, and a fine feeling for art. The draperies especially are largely and grandly arranged. In the heads, also, there will be observed a remarkable attention to the proper expression, as well as to character and form. The action of the hands is, generally, well studied. When the naked form is introduced, as in the St. Sebastian, it is conventional, and, as usual, shows no intimate acquaintance with the study of nature, but in all other respects these works possess merits of a very high class, and have justly been noticed by all the best judges of sculpture as examples, of their kind, thoroughly deserving careful study and imitation. It may be noticed that though the statues in the nave average about 3 feet in height, those in the chapels are nearly life-size. They are arranged in threes, over five demi-angels. It is to be lamented that some of these interesting works have been injured, while some have been removed, and the niches and panelling destroyed to make way for monuments, as, for instance, those of two ducal houses of Buckingham, of the respective families of Villiers and Sheffield. The statues, of all sizes, employed in the enrichment of the chapel of Henry VII. are said to have amounted, originally, to nearly three thousand. Many of the smaller ones, especially those in gilt metal, have, no doubt, been stolen.

#### Arrangement of Foliage in Decoration.

J. R. COLLING.

In applying natural foliage to decorative purposes, the first thing to be laid down is the general lines, that is, the direction and disposition of the stems which are to be afterwards clothed with foliage. Great care should be taken that these are judiciously chosen; they must not too closely follow Nature; there must be no broken or rustic foliage, such as we see so often in silversmiths' work; there must be a harmony and an agreeable contrast with the bounding or surrounding lines. In architecture nearly all ornament is obliged to be arranged geometrically, for without it is so, to some degree, it will seldom harmonise happily with the architecture which it is intended to enrich. It may sometimes be departed from to a small extent to give variety, and to gain picturesque effect; but there must be a certain harmony kept up, and the lines of the

foliage must not jar or clash with the mouldings or other architectural lines which surround it. For instance, if we take a spandrel, which is merely a triangular space left by the architectural lines in canopies and other places, the most simple of all lines to arrange the foliage upon will be three lines issuing from the centre and running to the points of the triangle. These lines are in harmony, because they do not approach too near or in any way jar or interfere with the bounding lines, and they are simply a geometrical division of the triangle into three other triangles. In the same manner, if we require the most simple lines for foliage in a square, we have them immediately in lines proceeding from the centre to each of the angles, which give the ordinary diagonal lines. Next, in the triangle, we have a triangle introduced in the centre. In the square we may introduce a diagonal square touching the centres of the sides of the larger square. This may be varied by introducing circles in place of the triangle or square; from this we arrive at the scroll in place of the complete circle. Commencing again with the first three lines, we can produce variety by uniting them by curves; further by branching, as in parsley; by leaflets in pairs, as in ash and fern; branching alternately, as in oak; and further, if required, it can be carried to any extent of elaboration and richness by following the manner of subdivision of any of the more compound leaves, as in some of the most beautiful and delicately divided ferns. Although this subdivision may probably be too elaborate to carry out in stone or wood, yet I can conceive of its opening a beautiful field for decoration in other materials—such, for instance, as diaper for linen fabrics, carpets, gold and silversmiths' work, painted decoration, papers for walls, and many other works. To return to our general lines, it is evident that variety can be gained by introducing scrolls, yet still keeping up all the original arrangement, until at last we arrive at a combination perhaps equal to the beautiful scroll spandrel from Stone Church, Kent, which perhaps, for the very charming manner in which it is arranged, is as successful as anything which can be met with. Another simple mode of arranging the lines is that of simply radiating from the centre as in flowers; the most simple, being three radiations or two threes, is in the lily, as I have already mentioned. Four, two fours, and so on, as in flowers. Another mode is that of fan radiation, as in the lupin and horse-chestnut. Of this character are many of the Greek honey-suckle ornaments. If the surface is large which is to be covered with foliage, it will be found to be highly advantageous to divide the surface into some pleasing combination of geometrical forms, afterwards filling in the spaces left with foliage. In this manner are some of the most exquisite wall-diapers of the Alhambra. Geometrical combinations have this great advantage—they are all founded on forms in Nature; there is no limit to the variety which can be produced, and they do not tire the eye like any confused or irregular arrangement. There is always a certain order and symmetry which is pleasing to the eye.

#### The Pavement of the Parthenon.

F. C. PENROSE.

The pavement of the Parthenon is bounded by four curved lines, viz., the edges of the upper step on the four sides of the building. The four angles of this curved surface are not precisely level; the south-west angle is about  $\cdot 16$  above the north-east and south-east angles. I think that this is simply owing to the lines of the earlier temple, which were also curved, being made use of as far as they would go, and by being produced in one direction only, and remaining fixed at the south-west angle. The line so produced would naturally fall below the fixed point. This is the case on the west front, south and north sides. The extreme points of the upper step of the east front are exceedingly near level. The result of a number of observations gives only a difference of  $\cdot 002$ , or  $\frac{1}{500}$  feet, a quantity which we need not stop to discuss. If these two points be joined by a straight line, the curve which forms the edge of the step will be found under the middle columns to rise to a height of  $\cdot 214$  above it. If the uniform curve had been preserved it would have been  $\cdot 218$  in the middle, which is about  $\frac{1}{45}$  breadth of front; and the curvature is so regular on the northern half of this front, where the steps rise immediately from the solid unbroken rock, and consequently no settlement can have taken place, that of four points measured at the centres of each column, three agree exactly with a circular arc: the fourth differs only by  $\cdot 003$ . The curvature is so very slight that it might be any regular continuous curve; for instance, in so small an arc no appreciable difference could be shown between the arc of a circle or that of an ellipse or parabola, and I think that the work was set out by means of the latter figure, which might be done very easily; whereas I need scarcely point out the difficulty, or rather impossibility, of using the circle, which would require a diameter of about  $2\frac{1}{2}$  miles. Let it be required to construct a circular or other arc of uniform curvature, whose length is 100 feet, and the rise at the centre is to be  $\cdot 25$ , or any other small measure which must not much exceed 1 foot. Construct with any axis a parabola, and set off from the vertex

A B = the proposed rise, and draw L M at right angles with A B. Now L M will represent the 100 feet horizontally, and ordinates drawn to the curve perpendicular to L M will determine the exact rise as many points as may be required, full size. The curve on the upper step north side of the Parthenon also approximates to a regular curve very closely. Its entire rise in the centre above the line joining its extreme parts is  $\cdot 356$ , which is very nearly in the proportion of  $\frac{3}{8}$  of the rise in the east front; it is exactly  $\frac{1}{250}$  length of the building. The curve on the south side seems to have been identical with the north side, but it has suffered more from the concussions which the building has undergone, especially as there is a great depth required on this side of artificial foundation. On the north side the steps are almost immediately from the solid rock. The curve on the west front is not quite so symmetrical as on the other sides. It has, I believe, been affected by the lines of the old building. The rise is exactly the same as the east end. The upper members on all four sides follow the steps, and are nearly parallel, but there is a little more curvature given to the steps; the entire rise of architrave is  $\cdot 173$  on east front,  $\cdot 175$  on west. The levels of those portions of the entablatures which remain on the north and south sides point out the directions which those lines had originally, and they were as nearly as possible parallel to the line of the step, excepting that just at the angle columns the step has a little the more declension. The frieze and cornice are exactly parallel with the architrave. In the temple of Theseus, also, these curves prevail; on the fronts the rise is  $\frac{1}{250}$  part of its length, on the flank  $\frac{1}{250}$ . The lines in the architrave are exactly parallel to the step.

#### The Parthenon Columns.

W. L. GRANVILLE.

With respect to the columns, each course of which the entire shaft was composed, being brought to the building, had then to be worked at the top and bottom in the following most elaborate manner. After the two surfaces had been smoothed to a most exquisitely true plane, radiating lines marking out the division of the flutes were next indented by means of some sharp tool. Such lines may be especially noticed on the Propylæa columns. Next three concentric circles were drawn out, also with some sharp instrument, the common centre of them being the axis of the column. Every one of the eleven courses which compose the shafts of the fifty-eight exterior columns that belonged to the Parthenon had the top and bottom surfaces worked with the same care and attention, which are so remarkable throughout the whole structure, whether the parts were to be covered or to remain visible. Each course had to be lifted into its destined place, an operation which was accomplished, it is supposed, by means of a machine called the trochlea—an assemblage of pulleys, fastened to a pair of shears or other scaffolding, and which, according to the number of such pulleys, was denominated *τρίσπαστος*, *πεντῶσπαστος*, *πολύσπαστος*, &c. At the end of the rope which passed through the pulleys were fastened the *ψαλίδες*, or *Forcipes ferreae*, described by Vitruvius (Lib. X.), an instrument somewhat like a pair of large scissors, in use even at the present day. These forcipes (for I believe there were more than one pair employed if the stone was very large) were made to lay hold of the two or four rough masses projecting from the block and left for the express purpose of raising the stone. When the circular stone or first course was lifted it was set into that place which had been marked out for it, by a circle nearly the size of the column itself, on the stylobate. It was then, according to the evidence which innumerable concentric circles display on the stylobate of the Temple of Hercules at Agrigentum, turned round and round (on a pivot of wood as some suppose) and ground down to a fine surface. I must doubt, however, if this operation of grinding was performed with each successive course, as I could find no other traces whatever of it in the same temple. The material of which the Temple of Hercules is built, is of an exceeding coarse, porous nature, and would leave, perhaps, but a few marks, which the weather might have obliterated. On the other hand, the Parthenon columns, respecting which I saw no traces of the grinding, are composed of a material supposed to be too fine to leave any such marks. Certainly none remain. With regard to the flutes, they were, as at the present day, considered with the finishing of the building, and worked up wholly after it was erected, with the exception in some cases where they are began at top and bottom as a guide. The method employed was this. After the vertical lines were drawn down from the points given by the radiating lines marked on the bed of each course, as previously described, the first stage was to work the column from top to bottom into a polygon, leaving a broad band where each arris of the flute is to come. The flutes themselves were next worked out to a curve, not their final ones, but very nearly to the required depth, still preserving untouched the band where arris is to come. The final stage was to work away the band to a sharp arris, and bring the flutes to the desired depth and curve.

## ILLUSTRATIONS.

MANSIONS, PONT STREET.

THE five residences illustrated are in course of erection on the north side of Pont Street at its junction with Sloane Street. Generally the accommodation is as follows:—On the ground floor the library and business-room is placed right and left of the entrance, the dining-room being at the rear of the library, overlooking an ornamental garden. A large inner hall, communicating with the main and servants' staircases, is placed at the rear of the business-room. The first floor consists of a drawing-room, which extends the whole width of frontage, and a boudoir at the rear overlooking the garden. The second, third, and top floors contain nine bedrooms, with dressing-rooms, bath-rooms, &c. The basement is well lighted and ventilated throughout, the walls of passages, kitchen, scullery, larder, &c., being lined with white glazed tiling. A servants' staircase and lift is provided from the basement to the top floor. In addition to the usual gasfittings, arrangements have been made for fitting up the buildings throughout with wires for electric lighting. The buildings are being erected by Mr. WM. WILLETT, builder, of Chelsea, with elevations executed in two tints of terra-cotta bricks and terra-cotta dressings of a special tint, supplied by Mr. J. C. EDWARDS, of Ruabon. The architect is Mr. HARRY B. MEASURES, of 2 Sloane Gardens, Chelsea.

## DECORATION OF A DOME.

THE following account is given by Mr. Ford Madox Brown of the decoration of the dome of the Manchester Jubilee Exhibition in an article in the *Universal Review* on "Historic Art":—

"About the middle of November 1886, Mr. G. F. Armitage, of Altrincham, called on me to inquire if I would undertake the decoration of the dome of the Jubilee Exhibition then in course of construction at Old Trafford, Manchester. Mr. Armitage belongs to that class of whom Mr. William Morris spoke once, in Manchester, as "we æsthetic upholsterers," a kind of business that seems to thrive best in the hands of educated gentlemen. He had been entrusted with the entire decoration of the buildings and gardens outside them, under a committee whose chairman was a gentleman named Neville Clegg. I was informed that there were eight large spandrels of the four huge arches 72 feet wide supporting the dome, for which I was required to furnish figures, the decorative portion to remain with the committee (Mr. Armitage). These spandrels, of which the shapes were not quite fixed, were each of them 36 feet long by 18 feet deep. They would have liked the immense spaces filled in with compositions or groups. As there was little over five months to do all the work in, I perceived that this would be impossible, offering, as the utmost that the time would allow of, to execute eight colossal figures in "sanguine" or red chalk, to be fastened up on gold backgrounds. It was agreed that this should be done, or what more I could achieve in the five months up till the opening day.

At this date I had a rather sharp attack of gout—the first outline sketch of the whole (now in the possession of Mr. Bodington, of Wilmslow) was made one day in bed—and it really struck me as a remarkable instance of faith, in modern times, that the Chairman and Mr. Armitage should entrust these gigantic works to a man whom they saw with pain crawling from chair to chair. We had decided that the eight spaces should be representative of Wool, Corn, Shipping, Commerce, Coal, Iron, Weaving, and Spinning. As soon as I began to study these spaces, charcoal in hand, I found that their eccentric shapes, with one acute angle far extended like the orbit of a comet, would in any case require more than the one emblematic figure to fill each of them. So I decided that each distant angle should be filled with a winged but legless second figure—a spirit of Lancashire Energy. The long wings would fill the acute angle of the spandrel. Each spirit should bear a trumpet, each trumpet should have a banner, each banner should be inscribed "Vis." These spirits of Energy were to be all alike, each blowing up the courage of the Lancashire workers, all growing legless out from the scroll patterns which

filled the golden grounds, but four of them were to be reversed. I reckoned on only having to execute one of them myself, the seven others to be repeated by assistants. The backgrounds were to be gold; the scrolls of foliage blue, with red berries, and one red-haired angel or spirit growing from them—the more incongruous the better for decorative art. The Greeks equally with the Japanese understood this.

But when all this of the design was settled, and some of the figures studied from nature, to our joint horror we found that there was no prepared canvas, in London, or in Paris, or anywhere else that we could think of, to be had under three months' delay. Expedient after expedient was thought of and fell through. At length it turned out that a certain manufacturer of floorcloth in Dundee would supply us with as many hundred feet as we cared for of a kind of very rough and open sailcloth, 12 feet wide. This a coach painter and decorator of Altrincham undertook to prime and prepare for us. It was rough and heavy at best, but there was no time for rubbing it down or giving it a surface; the heavy rolls were only half dry when they reached my house. Meanwhile the idea of sanguine or red chalk had been abandoned, and I had offered Mr. Armitage to paint all the panels in matted oil, and undertook that the decorative parts should also be done in my studio, provided that the committee would supply me the assistants. This was, under the pressure of circumstances, joyfully accepted. The walls of my studio in Victoria Park were covered with 12 feet wide canvas, fixed on rollers, for the room was insufficient in height. A spare bedroom was cleared out and used in the same way, and latterly a large stable and carriage-house at the end of the garden was converted into a studio, and devoted entirely to angels and their 12 feet long wings. The vehicle employed was a mixture of Robertson's and Paris's medium in equal parts, but I think I should recommend in another such case Paris's medium and copal varnish in similar equal parts. When the texture of the floorcloth was too hilly or rocky, we sometimes cut out a pea-sized knot with our knives. Altogether for heads 18 inches high and figures 12 feet long, the practice was not without its advantages.

I first made studies from nature of each of the nine figures, scale of 2 inches to the foot. Then I painted one of the angelic figures of *Vs*, entirely as a pattern for the other seven. Mr. Bruce Wallace, of the Manchester Academy of Arts, undertook to repeat these for me in the garden studio. These, with the exception of a few wings and a banner or two, he set to work at with so much courage and "energy," working from six and seven in the morning, that by the day required they were all completed, and, when hoisted up, looked so like the single original, that had I not known where it was placed I could not have told it from the others. My other male assistant was an old pupil and assistant of Rossetti, named Knewstubb. He was of use in all sorts of ways, particularly as a colourist, for whenever a bit of colour went wrong he used to be sent for to daub it over, till it looked "beautiful for ever." There was, besides, one young decorator, very useful, the son of a remarkable Altrincham decorator named Thomas. And I had the assistance of four young ladies, extremely vigorous figure-painters. Partly of the Manchester Academy, these ladies had also studied in Paris. Curiously enough, in Manchester, the men are more given to landscape; the ladies are figure or historic painters, perhaps because wandering about the fields and wild places in search of studies is less safe and appropriate to female strength and habits than to the masculine mood. The young ladies—and they were emphatically such—worked with a skill and energy that nothing could baffle or impair from the top of a ladder to sitting on the floor. Two of them even offered, at last, to take my place when they heard I should have to be hoisted up 50 feet in the air to retouch some parts of the paintings that when up on high looked weak and defective—while we were at work on them the dome was simply that of heaven itself. This substitution, of course, I could not listen to, but certainly they would have gone up had I permitted it. They also, when workmen and needlewomen failed to make a good job of stitching the heavy canvases together, started off with their thimbles to the Exhibition, and with their delicate fingers sewed for two days at the canvases massive as the sails of a man-of-war, the building the while crowded with starers, for all Manchester seemed to have contrived to get in on those last privileged days. Mr. Wallace, the iron muscles of whose throat and arms I made free with for my figure of *Iron*, would, as those who know him can imagine, have climbed and painted at the top of the highest flagstaff of the building had it been required by me, but this also I had to decline. Thus with the united goodwill and good temper of seven assistants and master, and a zealous committee, the anxious work got done, and I had the satisfaction of seeing, ten days before the opening, the twenty-four rolls of canvas placed on the lorry and depart, and gradually get strained more and more in their places aloft by the heroic workmen up in their perilous perches and floating galleries. I no longer had to wake at four in the morning and remain sleepless in the horrid dread of the thing never getting done for the ever-nearing 1st of May. It is

thing of the past now, as this article soon will be. If those works (the outcome of "Lancashire Energy" not yet ended in Manchester) should in the slightest degree tend to promote in Britain that love of style that once prevailed in Greece and Italy, the writer's and painter's object will have been fulfilled.

### THE OLD METAL-WORKERS OF GLASGOW.

THE following communication has been addressed to the *Glasgow Herald* by Mr. Alexander J. S. Brook, F.S.A. Scot., of Edinburgh:—

Many years ago, through the medium of your columns, much information was elicited about the history of old Glasgow and its worthies. Incidental references were made to many of the Glasgow craftsmen, but no connected account of the old Glasgow silversmiths and their marks has yet been compiled. A good deal of plate of early Glasgow manufacture has been collected, and is now to be seen at the Bishop's Castle in the Exhibition. A memorial volume of that collection is in course of publication, and it would help me in the notes I am preparing on the plate if I could obtain some further information regarding these craftsmen of bygone times. It would aid in determining the precise age, and in clearing up much which has hitherto been shrouded in mystery.

I have collected many notes regarding the old silversmiths of Glasgow, as well as of those of the other burghs of Scotland, and I briefly give the substance of them here in the hope that it may awaken an interest in the subject, and result in the gathering together of information which a few years hence it will be impossible to do.

The goldsmiths of Glasgow were incorporated with the hammermen, whose seal of cause was granted in 1536. In this respect they resembled nearly all the other burghs in Scotland, with the exception of Edinburgh, where the goldsmiths formed an incorporation of their own. Unfortunately the records of the Hammermen's Society are lost, with the exception of one volume, 1616-1717, which is now in the possession of the secretary of the society. This might furnish some valuable information if any antiquary could be found to go carefully through it.

The first reference to a goldsmith occurs in 1616. Glasgow at that time was a small burgh and university town, containing about 5,000 inhabitants, some of them merchants, others craftsmen—not such individuals as would be found now carrying on trade or the useful arts in a burgh of the same size, but men accustomed to the use of arms, and retaining a strong tinge of the feudal system.

No very early plate of Glasgow manufacture is known to exist. This is not to be wondered at, for the following extract from the burgh records—date 1639—explains it:—"The said day it is ordanit that publication be made throw the town, be sound of drum, that the inhabitantis of this burgh bring their hail silver plait, to be bestowit in defence of the good common cause in hand, conforme to the ordinance of the committee at Edr."

About the end of the seventeenth century we glean a comparative view of the numerical strength of the trade from a jotting on the back of the draft of a proclamation preserved in the Edinburgh records. From this it appears that, besides the goldsmiths in Edinburgh, who were about 25, in Glasgow there were 5, Aberdeen 3, Perth 1, Inverness 1, Ayr 1, Banff 1, and Montrose 1. In all these places plate was manufactured and hall-marked with the distinctive mark of the burgh.

The social status of the goldsmiths of Glasgow differed much from that of those of Edinburgh. In the capital they were the bankers, money-lenders, and speculators of their day; while in Glasgow it was the merchants, and specially the "tobacco lords," who were the trade aristocrats. This may account for the fact that it was no uncommon thing for some goldsmiths to be partners in many strange concerns, altogether alien to their ordinary business. Thus we find that the most famous family of Glasgow goldsmiths—the Lukes of Claythorn, much of whose plate is to be seen in the Exhibition—were partners in a soapery, an ironwork, and in many adventures with ships—notably in one in which cherry sache was first imported into Glasgow. On the other hand, monopoly was the rule of the trade in Edinburgh; and, as is abundantly proved by the records, if any goldsmith ventured beyond the strict limits of his trade, he was speedily expelled from the incorporation, and his name deleted from the roll.

It is questionable if up to 1730 any goldsmith had a shop in Glasgow. In 1753 Robert Luke, who was at one time treasurer for the city, was succeeded by Bailie James Glen, and it is noted that at that time he was almost the only one in the trade in the West of Scotland. Again, in 1790, we find that there were only two goldsmiths' shops of any note in the city—one kept by Adam Graham, in King Street, and the other by Robert Gray, in the Trongate; and, strange to say, the latter silversmith could, in addition to his more valuable wares, always furnish a customer with a cane or umbrella, the umbrella,

at that time a modern luxury, being usually made of yellow or green glazed linen.

The burgh mark, impressed on all Glasgow plate, is the city arms, which commemorate the well-known miracle of St. Kentigern, the patron saint of the city, with reference to the recovery in the fish's mouth of the lost ring of the frail Queen of Caidyow. The early punches are unusually large in size, but vary little in detail.

In some early specimens of Glasgow plate there appears what seems to be a variable date letter. Specimens of two alphabets have been found between 1696 and 1708. From 1720, or possibly a little earlier, the letter S, enclosed in differently shaped shields, seems to have taken its place, and was impressed on all plate down to the establishment of the new assay office in Glasgow in 1819, after which date the date letter was again introduced, and is still continued. Can any one trace the origin of this S, or tell by whom it was stamped, and what it meant?

From many sources the following list has been compiled. Some are represented by initials, for their names are unknown to me. They are arranged as near as possible chronologically, but in many cases the date is only conjecture:—

1616. John Kirkwood.	1753. D. W.
1660. W. Cockburn (fr. Edin.).	1765. B. & N.
1665. Thomas Moncur.	1765. I. F.
1665. John Louk or Luke.	1765. Samuel Telfer.
1673. Robert Brook.	1776. Milne & Campbell.
1680. George Louk.	1780. James M'Ewan.
1682. Thomas Cumming.	1780. Adam Graham.
1686. James Stirling.	1780. Robert Gray.
1687. James Cumming.	1784. James Adshead.
1689. William Hodgson.	1785. James Cullen.
1693. William Clerk.	1800. — Cochrane.
1695. James Louk.	1800. Mitchell & Russell.
1717. Johan-got-helf-bilsings.	1800. A. & I. D.
1728. I. B.	1800. K.
1731. Robert Luke.	1800. J. L.
1731. Robert M'Gilchrist.	1800. I. T.
1753. James Glen.	

The names of watchmakers are not included in this list, as it does not appear that they dealt in plate. Can any of your readers furnish me with information about any of the above craftsmen, as to the time they were in business, or anything notable about them? I feel certain that the list might be supplemented very largely, and I will be glad to hear of further names. Some information about the Lukes of Claythorn would also be most acceptable. The first mention I have of the name is John Luke in the reign of Charles II., and the last, Robert Luke, in 1753. Can the dates of birth and death of the different members of the family between these years be ascertained, so that the probable time they were in business may be determined? Towards the end of last century another stamp J. L. is found. Whose is this? Should any of your numerous readers have plate in their possession of Old Glasgow manufacture, I would esteem it a favour if they would correspond with me and send me rubbings of the marks.

### FOUNTAINS ABBEY.

AT the excursion of the Yorkshire Archaeological Society, which has just been made to Fountains Abbey, Mr. St. John Hope conducted the members over the abbey, where for some time past excavations have been in progress under his superintendence, for the purpose of establishing something more than has hitherto been known or conjectured as to the disposition of the ancient abbey buildings, and the uses to which certain portions were put by the old Cistercian monks. Mr. Hope sketched the results of excavations already made, and gave an outline of work shortly to be resumed. It was not easy, he said, to discover the original disposition of the church. The popular notion was that when, in Mediæval times, people built a church like that, they intended to have a grand view from end to end. That was an erroneous opinion. They built in that manner because it was the easiest way of building, and having got their erection, they proceeded to cut it up by screens. There was no documentary evidence to tell them how the house at Fountains was divided, but the original limits of the church were different to what they were now. He could not say whether the nave and the aisles showed their original setting out. The limits of the early choir were marked out by thin lines in the grass upon the platform near where he was standing. The Cistercians seemed to have generally completed the plan of a church before going on with the other portions of their structure. The choir originally, like most Cistercian choirs, was flanked on either side by three chapels projecting eastward from the transept. The old choir must have been very dark, because there was just room for a narrow window on either side. There was very good and clear proof of walls dividing the church from end to end, and in some a

the Cistercian abbeys they were marked even more strongly than at Fountains. The evidence as to the *conversi* stalls he was not quite sure about, but three of the pillars on either side had the plinths chopped down, and his theory was that that had been done to fit the ranges of stalls. Another feature was that the aisles and the nave were cut by screens at intervals into a number of chapels. There was a chapel in almost every bay. The roofing of the aisles was peculiar. The ordinary way was to have a regular vaulting right along, but here an arch was thrown from the pillar to the wall, and then a pointed barrel vault from arch to arch. It was rather a weak form of building and not at all English in feature. There were strong indications of an organ having been erected at the west end, because against the pier there were cuts for two very strong beams and other marks. Against the west end of the choir there was a solid stone screen, with a sort of music gallery on the top. Between two screens there was a space in which sick brethren used to sit on a bench. There was a great rood screen, with images of Our Lady and St. John. In the last few days he had excavated the pits underneath the upper rank of stalls, and the total number of earthenware pots found embedded in the walls had now reached the number of twenty-four. One authority advanced the theory that they were put there to augment the sound of the music; but on the south side there were no traces of pots, and it might be that the singing was better on that side than on the north. That the central tower collapsed at an early date was clear by the buttresses. The community must have first underpinned the Norman work, and then, finding that to be of no use, had built the great buttress, which looked uglier now than when the stalls ran past it. The central tower had fallen certainly just before the suppression of the house. The great tower was one of the most imposing in the north of England. Near it was an altar to St. Michael the Archangel, with a bracket for the image of the archangel. The Norman part of the choir was utterly gone, and even of the later work there were no remains whatever. What was commonly known as the altar platform, and was supposed to have been the high altar, was nothing of the kind. The high altar was a solid piece of masonry rising through the ground, and that was not it at all. Behind this platform and underneath the Perpendicular window were the nine altars against the east wall. Each altar was divided by a solid stone wall, and subsequently the number was reduced from nine to one. The whole of these altars were screened off from one another and from the church, so as to leave a passage from end to end. Mr. Hope concluded by describing the formation and uses of the cloister, the chapter-house, the auditoria, the dormitories, the infirmary, and the cemetery.

### LONDON STREET ARCHITECTURE.

THE ideal of Mr. Frederic Harrison—"I for one," he says, "will stoutly look in the future to an ideal London, which shall boast of a silvery Thames at the Isle of Dogs, and of aqueducts, from the northern hills, as superb as the Claudian and Julian structures of old Rome; which shall reduce her death-rate to Sir Spencer Wells's goal of at least twelve per thousand, and which shall offer her citizens all that public gardens and public libraries, music, museums, and art galleries, and a beautiful architecture, can accomplish for the elevation and the refinement of their common existence"—may be a long way ahead, the *Daily News* says, and hard of attainment, but among the five millions of us there is not a croaker who will deny that it is an ideal worth striving after. Not only so, but the rate of progress is so considerable that only the vastness of London hinders people from realising its full significance.

Take the example of Oxford Street, the bald, the ugly, and the mean. At the rate at which improvements have been effected there during the last two or three years, Oxford Street will certainly become, in another twelve or fifteen, one of the handsomest of European streets. The change is especially noticeable on the south side of Oxford Street, from Tottenham Court Road to the Circus. Nearly opposite the corner of Tottenham Court Road there stands a pretty specimen of the new style of Oxford Street architecture—Messrs. Kennedy & Francis's Art Depot—the plans and elevation of which were shown in the architectural section of the Royal Academy Exhibition of 1886. Tasteful simplicity of design, congruity between architectural style and business purpose, these are its distinct characteristics. Its façade is of red brick and pale pink terra-cotta. For its narrow frontage, not the architect, but the ground landlord is responsible. Mr. Henry Heath's buildings, 107 Oxford Street, were opened nine or ten months back, and the design, like that of the art store already named, was exhibited at the Royal Academy. The architect is Mr. E. E. White. His design is admirable; the construction solid and enduring, without an inch of "jerry" building from top to bottom of it. A building of three storeys—excluding the basement, and the steep, picturesque gable, which is one of its best

features—its street elevation is constructed of the fine, strong, pale pink terra-cotta manufactured by Burmantofts, of Leeds.

It is believed by "the profession" to be one of the most successful instances of the application of this kind of terra-cotta to architectural purposes. Of ornamentation there is very little, but people with an eye for architecture will be pleased with its arrangement of wall spaces (which gives the impression of variety in unity) and with its central tiers of bow windows, surmounted by their steep picturesque gable, which, again, is flanked on either side by a balcony. The terra-cotta work of this façade shows a considerable improvement over that of the Art Depot frontage higher up the street; for one thing, the joinings between the separate pieces are firmer and finer. To South Kensington belongs the distinction of the introduction (at any rate on a large scale) of the architectural use of terra-cotta. Oxford Street, still the scorn of the critics, may boast of one or two among the most promising experiments in this costly and beautiful material. And to the credit, be it said, of those whom we may call the pioneers of the architecture of "ideal" London, they spare neither labour nor expense over their efforts. On the opposite side of Oxford Street, and not far from the houses already described, there will be opened, at the end of this year or the beginning of the next, an immense building (Nos. 26 to 32), containing a theatre, a bodega, and a restaurant, all in one. Red sandstone and Rockingham glazed brick are the materials here used. In the opinion of some admirers of this building the glazed brick is preferable—even in point of beauty—to the terra-cotta, which seems to be the favourite material among the rebuilders of Oxford Street. One may well hesitate before accepting the conclusion. But however that may be, one must admire the spirit of determination in which this particular effort has been prosecuted. The first experimental trials cost large sums of money; and now that the trials have succeeded the street elevation alone will, it is said, cost 20,000*l.* before it is finished. Each moulded brick costs fifteenpence, and is hard and strong enough to last "for ever." Expensiveness is, of course, no substitute for taste, and is admirable only when it implies thoroughness; adaptation of means to ends; utility—without which decoration can never be anything but excrescence, frivolous, impudent obtrusiveness—trash, in a word.

This vital condition, of the combination of use with beauty—beauty growing out of use, like the flower from its stalk—is well observed in the next new house which we pass. He were a hard, narrow purist who would carp at Mr. Colcutt's building—Dutch Renaissance—which shines like a good deed in the naughty world of the old, ugly Oxford Street of "Ouida's" nightmare. The street elevation of this building—Duveen's dépôt of antique and decorative furniture—is, with its pair of lofty gables, distribution of window spaces, disposition of its central projection, and alternation of red with pale orange terra-cotta, one of the finest in London. Of all the new buildings facing the street it is the most ornate. It is an admirable success, both in composition and colour. To an observer's mind it will very likely recall the Constitutional Club in Northumberland Avenue. But the styles are not identical—they are kindred. The style of the Oxford Street building is, as already said, Dutch Renaissance. That of the Avenue building is modern German Renaissance. It is exceedingly popular nowadays in the German towns; in fact, one would not be far wrong in instituting a parallel between this revived German (or Germano-Flemish) style and the Queen Anne style, of which there has been a pretty general outbreak in and about London, especially in the (æsthetic) suburb of Bedford Park, in Pont Street, in Tite Street, and in the Cadogan Square district, which even "Ouida" greets "with gratitude and hope."

As regards the new architecture of Oxford Street and its tributary streets, it can hardly be designated a distinct "style"—in the old acceptance of the word. Of course an exception must be made in the case of Mr. Colcutt's beautiful building already named. The new style, or styles, must grow—like Topsy. No architect says, "Go to! Let us invent a style." The "style" will simply be the final and artistic expression of adaptation to the new needs of body, mind, and spirit—the expression of a stage in social evolution. These new buildings, however, do possess some common characteristics. In other words, they do foreshadow the rise of a new kind of architecture—Victorian architecture it might be called, from the period of its beginnings. Between Mr. Colcutt's Renaissance house and the Classical Pantheon which flanks it on the east there is no kinship of any sort. But there most evidently is between it and the house which flanks it on the west—namely, No. 183 Oxford Street, a restaurant—a tasteful building designed by Professor Kerr, of King's College, whose drawings of it were exhibited in the Academy.

Pass by the corner of Gilbert Street, up Duke Street, round by Stalbridge Buildings, Lumley Street, through Grosvenor Square to Mount Street, and you will find many excellent specimens of a kind of architecture which seems destined, at no distant date, to transform large tracts of central and western London. The supersession of the flat, dull, and mean skylines

of the old houses by steep, bold gables and broken roofs; the employment of balconies, arcades, and projecting windows; the feeling for colour; the grouping of wall spaces, with a view to the distribution of light and shade—all these are more or less characteristic of the new Domestic architecture of London. In a few years Mount Street will become an architectural gem—especially if the suggestion of building a quadrant, or crescent, between it and Grosvenor Square be carried out. It is true that the actual builders of the Mount Street new houses are scarcely free agents, and that the ground landlord, the Duke of Westminster, is the prime mover in this process of reconstruction. Still, the duke deserves all the praise due to good taste; while, moreover, it is to be remembered that in displaying all this good taste, he has obeyed an impulse of the time.

Nothing can be more striking, in this gradual transformation of London ugly into London beautiful, than the displacement of the wretched houses on the western side of Duke Street by the present really fine range of buildings of red brick, with their basements of grey granite, pilasters of red, window casements of terra-cotta, steep, central gable, bay windows, and balconies. The Duke Street and Mount Street buildings, portioned off into sets of chambers rented at two to three or four hundred a year each, are, however, less significant of the change in public taste than the artisans' block dwellings in their immediate neighbourhood. The Stalbridge and Balderton buildings behind Duke Street are palaces in comparison with the houses which they have superseded. With the recreation-ground which, at the completion of the block now under construction, will be opened to the occupants of these blocks, this new class of "composite house" is a visible testimony to the popular craving for air, space, and light. If, again, we compare the newest block-dwellings with those which were erected at the beginning of the artisans' dwellings movement, we shall notice a continuous improvement.

In a few months there will be opened, on the Victoria Embankment, and next door to the National Liberal Club, a superb block of buildings, the style of which is believed by some professional authorities to be the style of the London of the future. This is the Whitehall Court Buildings, the architects of which are Messrs. Archer & Green—to whom, by the way, London already owes Cambridge Gate, on the site of the old Coliseum, Regent's Park; the new Arcade, in Bond Street; the Holborn Restaurant, the First Avenue Hotel, and other well-known edifices, including the immense structure at Albert Gate, concerning which there were recently certain inquiries in Parliament. The style of Whitehall Court is modern French Renaissance—an extremely versatile style, so to speak, and one which, in the hands of Messrs. Archer & Green, is revealing itself in its most imposing forms. There can be no doubt whatever that this style is admirably adapted to such a building as Whitehall Court, a gigantic palace of flats. But perhaps it were hard to tell to what extent it will pervade the future architecture of the metropolis. However, it is very certain that Whitehall Court, with its open arcades, its lofty pavilions, and its balconied storeys of white Portland stone, is one of the greatest architectural acquisitions of modern London. Together with the National Liberal Club, it constitutes a worthy adornment to one of the noblest public roads in the world. Nothing need here be added to all that has been written about the National Liberal Club, the work of Mr. Waterhouse, R.A., the same gifted artist who designed buildings so different in character to the Embankment Club House as the Natural History Museum in Kensington and Owens New College and the Town Hall of Manchester. But its neighbour, the palace of "flats," demands a word or two more. Its internal construction is a marvel of solidity and convenience. From the electric light to telephonic tubes and hydraulic lifts, no modern invention is wanting to make life easy and pleasant at the Palace.

In this quarter of riverside London, at all events, French Renaissance and the styles which most closely approach it seem destined to be the dominant styles. Between Whitehall Court and Blackfriars is another huge edifice—Savoy Mansions—which may be classed with the foregoing, and which was begun two years ago last July. The materials here used are Bath stone and glazed-ivory brick. The inner court, or quadrangle, of this building, though in the first place designed to distribute light, suggests promise of ornamental utility. Of a different style of design, but fairly in keeping with its new neighbours, there rises gradually, at the Westminster end of the Victoria Embankment, Mr. Norman Shaw's building, which is to contain the central offices of the metropolitan police—the new Scotland Yard, in fact. This building, which will in every way constitute a worthy addition to the architecture of the Embankment, will stand on a granite plinth 36 feet high. Its site is the site of the ill-starred Opera House, upon the foundations alone of which 42,000*l.* are said to have been spent. The superstructure of this new Scotland Yard is to be of Portland stone. The huge solid granite basement is well worth a visit. The granite blocks are quarried, hewn, and moulded by the convicts at Dartmoor, and, to tell the truth, their handiwork

does the convicts credit. The only building which, on the Embankment between Westminster and Blackfriars, disappoints one downright is the School Board office. It looks like a factory for crammers to turn out young minds, as elsewhere men turn out bricks and pig-iron. But one may find compensation not far off, in the City of London School—a noble building. And, again, in those houses of red Fareham brick, terra-cotta, and white Doulton stone, which Mr. John Dunn, an architect inspired by love of the dead-and-gone past, has erected at the river ends of Surrey Street, Arundel Street, and Norfolk Street. One regards their attractions with a sort of pathetic interest; for in truth, to press later Gothic, Gothic of the Tudor period, with a stamp of ecclesiasticism upon it, into the service of modern commercialism, of Niger Trading Companies—whose bags of experimental oil-nuts, soils, and cottons fill some of Mr. Dunn's rooms—does seem a little like breathing into a beautiful corpse. What with all the shields of the family of the Howards, and of all their related families, painted on all the stair windows, from top to bottom, the Duke of Norfolk's charming new houses are, as one expressed it on the spot, "a school of heraldry." But what have Niger Companies—Nigger Companies—analysing their oil-nuts, to do with heraldry? Nothing, alas! But heaven forbid that one should grumble over the substitution of the dreary, hideous brick-boxes of old, by these buildings, so distinguished by their taste and their learning. Besides, Mr. Dunn's charming houses are not entirely made over to the niggers and the nuts. The Niger Company is only one tenant; Surrey House, Mowbray House, and the rest are to let for business offices and dwelling suites.

The rival styles are various—"Queen Anne," Dutch Renaissance, German Renaissance, modern French Renaissance, and a new something that appears to be a combination of most of them. But there is, very nearly finished, in Fleet Street—corner of Chancery Lane, opposite Child's Bank—a most beautiful building, and as noble as it is beautiful, a building in quite another style (Anglo-Italian of the Classical Renaissance), and unique in London. This new structure, a branch office of the Bank of England, wins the admiration of all who see it. Its architect is Mr. W. A. Blomfield. The superstructure, of Portland stone, is raised upon a massive base of roughened grey granite—a piece of work which in itself shows originality. Red granite, from Peterhead and the north of England, is used in the simple and graceful columns, in the wall panels, and in the window spandrels. The upper main cornice is one of the finest details of a building of which purity, distinction, dignity are the essential attributes.

## MUSEUM EDUCATION.

THE report of a committee on provincial museums was presented at the meeting of the British Association by Mr. F. T. Mott. The committee were appointed to consider the ideal to which provincial museums should endeavour to attain and suggest methods for approaching that ideal. Every provincial museum ought, it was stated, in the first place, to be a fully illustrated monograph of its own district. The details of each district can be worked up more thoroughly and more cheaply by the local museums than by any other agency, and if the entire history of the district and its inhabitants is thus represented, special attention being given to any group of objects for which the district is remarkable, this will be almost as much as any local institution can accomplish. But science is daily becoming more exacting in its demands. Details which were thought ample in any provincial museum twenty years ago would now be regarded as quite insufficient. Provincial museums have made their collections hitherto in a very unsystematic manner, by donation or purchase, as opportunities occurred. In order that the scientific statistics of the country may be thoroughly investigated and made known as quickly as possible, a much more businesslike system of collection should be adopted. The district should be divided into sections and a paid collector appointed for each of them, whose whole time should be occupied for several years in obtaining specimens and records in every branch of science represented in the museum. In nearly every part of the United Kingdom competent men could be found to do this work for very moderate salaries. The necessary apparatus must be provided for them, they would generally require some amount of instruction, and during the period of their operations a sufficient staff of assistants must be employed at the museum to deal with the specimens brought in. To carry out the work in this systematic manner funds on a more liberal scale than is now usual must be provided for the first few years; but the value of the museum would be immensely enhanced, and when the local collections were made tolerably complete, the permanent income required for maintenance would be very much less. The town museum should be the place to which all students and teachers of science in the district should naturally go for assistance. To *bonâ-fide*

students every encouragement and facility should be given, and loan collections should be prepared for teachers. A system of travelling museums which circulate among the principal schools of the town has been adopted at Liverpool with great success. The practical value of museums as important factors in all adequate systems of education is not recognised by the general public. Too many of these institutions have hitherto been but toys and hobbies, and require complete reorganisation. No free rate-supported provincial museum in the kingdom has attained to the ideal recommended in this report.

### LIGHTNING CONDUCTORS.

AMONG the subjects brought before the Congress of the British Association, that of lightning conductors furnished the opportunity for a discussion, which was conducted on the respective sides by Mr. W. H. Preece and Professor Oliver J. Lodge. In the report of the conference on lightning conductors held some years back, rules were drawn up for their use and application, and have been almost universally acted upon. The use of copper was preferred to iron; perfect connection with damp earth was to be secured by plates, and the point of the conductor was to be blunt, to prevent fusion if struck; whilst all round its upper part there was to be a ring of projecting points to attract the electricity from the atmosphere, and so continuously draw the potent force harmlessly away. People have trusted to their lightning conductors, and they have paid for copper at a heavy price to insure their effectiveness. Government has ordered their use in the services, they are fitted to churches and tall edifices ashore, and are hung to the topmasts of ships at sea. Their efficiency has been relied upon, and the inmates of houses, believing in the protection of the lightning-rod, have paid little heed to storms, and gone on their different ways rejoicing. Since the decease of Dr. Mann, his widow has founded a small lectureship, and Professor Lodge has during the present year delivered two lectures. The first experiment consisted in giving the imitation lightning discharge an alternative path, or, in other words, the choice between a certain conductor and a certain length of air. From a Holtz or Wimshurst electrical machine two Leyden jars were charged, the spark flying off between the two terminals of the machine. But the outer coats of the jars were led to a second discharger, the air-space in which could be varied. To the rods of this second discharger a circuit of fine iron wire was attached, and the electrical current, or flash, had before it the choice of conduct by the wire, or of bridging spark through the air, by the hiatus between the poles of the discharger. In its first condition the only discharge obtained between the first set of terminals was a feeble and intermittent, but frequent, sparkling, very different from the loud report heard when the second set of knobs was brought within striking distance of each other. These second knobs may be at double the distance apart of the first knobs, and yet the discharge will be complete and noisy. The two sparks occur together; the first one precipitating the second. But the reverse will not take place. The experiments have been varied in different ways. Whenever the second spark was allowed to occur, the first spark was very loud; but so soon as the discharge was compelled to traverse the alternative conductor by putting the knobs too far apart for the current to bridge the gap, the noise of the discharge was much diminished, not merely because there was only one spark instead of two, but because for some reason, the discharge meets with such obstruction in the wire that its duration is lengthened. In the first experiments the length of the first spark was maintained at 1 inch; the length of the second spark was varied until it sometimes passed and sometimes missed. The alternative path was 40 feet of stout (No. 1 Birmingham wire gauge) copper rod, with a resistance to ordinary electric currents of 0.025 ohms. Nevertheless, the discharge refused to take this apparently easy path, and persisted in jumping the air, although the gap measured 1.43 inch. This is the critical distance, for if the knobs are removed further apart the discharge goes by the thick copper wire, and the noise and suddenness of the discharge are less. But if for the thick copper plate rod a similar length of fine iron wire is employed (No. 27 Birmingham wire gauge), the resistance of which to ordinary currents is 33.3 ohms, or 1,300 times as much as the other, the discharge distinctly prefers the iron wire; for if the knobs remain at the same distance apart as before, no sparks are given off, although the critical spark is increased to 1.03 inch. This is the result which has caused the surprise; for, carried out inferentially to its ultimate, it is as though a fine iron wire should be a better lightning conductor than a stout copper rod. Professor Lodge explains this astonishing obstruction offered by good conductors to the sudden rush of static electricity—that it is due to electrical self-induction. A current cannot start in a conductor instantaneously any more than water in a pipe can commence to move at full speed.

Give the water a violent blow and it resists like a solid; so with electricity, the flash occurs, and the conductor must either carry it off or not at all, for the electro-motive force required to overcome the obstruction of a considerable thickness of air may be pierced, and the charge flash off sideways to anything handy. The lightning discharge itself is, essentially, a varying current, rising from zero to a maximum, and then dying away again. There is a certain amount of energy to be dissipated. It may be that the rush of electricity does not suffice to get rid of all the stored up energy of the charged cloud. If the conductor be resisting, the single rush may suffice; but, if it be a good conductor, its capacity may be insufficient. The same would happen then as with compressed air, or water running out of an orifice. If a wide, free mouth be suddenly opened, the escaping air oscillates until the stored-up energy is spent. Remembering the rapidly-oscillating character of an electric discharge, and the fact that a rising current begins on the outside of a conductor, no current under a certain rate of alternation would be able to penetrate much, if at all, below the surface; and thus, in this outer pellicle, the electricity will oscillate to and fro, whilst the interior of the conductor will take no part in the action. It must, therefore, Professor Lodge urges, be better not to make a lightning conductor of a rod, but to flatten it out into a thin sheet, or draw it out into detached wires. Any plan, indeed, for increasing surface, and spreading it out laterally, will be an improvement. This resistance the professor prefers to call "impedance," for resistance proper transforms the current into heat, while the obstruction referred to impedes the electrical discharge, and originates a tendency to side flash. The greater the "impedance" in a conductor, the less able is it to carry off the flash. The oscillating action on the conductor, which gives tendency to the flash to escape to any contiguous conducting substance, such as bell wires, gas and lead pipes, roof gutters, may give rise to serious accidents. Gas may, for example, be ignited by the fusion of its pipes. The inference from these experiments is that the lightning conductors would be best constructed of barbed wire, the wire not being so thin as to be deflagrated by the lightning flash.

Mr. Preece argued that if we wanted to know anything about atmospherical electricity, we had to go back to the works of Benjamin Franklin, 100 years ago. Up to 1870 there were absolutely no rules for the guidance of those who desired to erect lightning conductors for the protection of buildings. In that year a great conference was held on the subject, and the result of its deliberations was published in a book, and included a set of rules for the construction of conductors. We had since had great experience of them. He had under his supervision no fewer than 500,000 lightning conductors. Some time ago a lectureship on atmospherical electricity was founded in memory of Dr. Mann, who experimented on the protection of buildings in South Africa. Professor Oliver J. Lodge was selected as the lecturer, but instead of cracking up the work of the conference, he took the other line; and if his statements were true lightning conductors would be of no use, and no buildings would be safe in a thunderstorm. Professor Lodge had committed himself to fallacies which it was now his duty to bring before the meeting. The professor assumed that a lightning-rod formed part of the flash. Well, it did not. Nobody had ever seen a flash of lightning strike a conductor. The function of a conductor was to prevent the possibility of the building being struck by the flash. If it should be struck, there was some defect in the construction of the conductor. Lightning did not go careering wildly about, but passed along a path prepared for it. There was another fallacy, viz., that a flash of lightning was instantaneous. There was no proof of that. We saw a flash of light, which indicated part of the discharge, but how long the discharge lasted we did not know. There were invisible flashes of lightning, which was proved by the fact that persons had been killed under trees when there was no visible flash. He, however, came to that conclusion from the effect on telegraph wires, when there were currents of sensible duration, showing that the flash was not instantaneous. The next part was hardest to discuss. It was the assertion that lightning was oscillatory in its character; that it did not go direct from the cloud to the earth, but went flashing backwards and forwards with considerable frequency. This assertion was based more on mathematical reason than on absolute observation, and engineers had no great respect for mathematical development unless it were confirmed by absolute experiment. The facts against the theory were that electro-magnets were affected for a considerable duration of time by lightning flashes. Iron and steel were affected, and he had heard letters of the alphabet signalled along the telegraph wires by a flash—the letter R which needed three signs, C which needed four, and there was a case on record of G which needed eight signs. Under those circumstances the flash could not be oscillatory unless the oscillations were very infrequent. A discharge from condensers or Leyden jars might be oscillatory, but they were dealing with flashes of lightning. While he was attacking Professor Lodge in that way he must say that no one had worked harder or more honestly in the matter. Professor Lodge had made experiments, and they

were correct, from which he deduced that the self-induction of copper was greater than that of iron. He also had made similar experiments, but with just the opposite result. But though the experiments made by Professor Lodge might seem to tell against existing theories, he believed the professor was on the eve of a discovery that would widen our knowledge on the subject. He had started a fresh hare which electricians must follow up and kill. Self-induction was called up to explain all the phenomena which they did not understand, and he inclined to think it was very much what the Americans called a bug. In the telegraph science they had known it for many years, and called it electro-magnetic inertia. The next fallacy was that most conductors did not protect any area, but it was known from evidence that they did. He preferred to stand upon the experience of the past rather than upon Professor Lodge's mathematical assumptions. There was a tendency to hasty generalisation among mathematicians, but there could be no doubt that the experiments of Professor Lodge and others were opening their minds to the true nature of electricity, and that they would in time be able to speak of the mechanical character of electricity. They wanted to know where the energy came from which was so destructive in a flash of lightning. Aqueous vapour condensed and falling as rain at the rate of one millimetre per acre per hour developed an energy of 600 horse-power per acre. There was the creation of the energy which only wanted further development to turn into a source of electrical energy. He felt convinced that the result of that discussion would be to establish the truth of the position taken up by the Lightning-Rod Conference, and would bring to the front what they were all anxious to see, the true theory of electricity shadowed forth by Professor Fitzgerald in his opening address, and that would make this meeting an epoch in the history of electricity.

Professor Lodge said he had no lightning conductors under his supervision and all his conclusions were formed from experiments, and if they were correct very few buildings were effectively and thoroughly protected at the present time; and, further, if his views were correct, lightning-rods would in the future cost very much less than now. The term electro-magnetic inertia seemed to imply that they knew more than they did, so he preferred self-induction until they attained to knowledge. He replied to the assertion that no protected building has been struck by lightning by citing the case of the Hôtel de Ville, Brussels, which was recently struck and set on fire by lightning, although its roof bristles with lightning-rods put up on the present approved form. He affirmed that iron rods are quite as efficient as copper ones; and inasmuch as they are a great deal cheaper they might be more extensively used. He has found in many cases that buildings are left without any lightning conductors, because it is cheaper to insure the buildings than to furnish them with lightning protectors. He had made some careful experiments in which he provided alternative courses for an electric current, and he found that it required less electro-motive force to send the current along a thin iron wire than along a thick copper one. The object of the conductor was to prevent a flash of lightning, but wires were struck and melted. The conductor had two functions to perform—to act as a point and prevent a flash if it could and to carry off a flash when it could not help receiving. The electricity before had some energy. It might be better to let it dribble away slowly down a bad conductor than to let it rush headlong down a good one. The length of flash was a question for the consideration of meteorologists, and the duration of flashes was a point on which the same gentlemen might do good work. He had seen flashes which appeared to last two or three seconds, but he thought they must have been a succession of flashes. The fact that flashes deflected the compass needle did not prove that they were not oscillatory, nor did it prove anything as to their duration. A short powerful flash might produce the same effects. There was the question of a flash magnetising a bar of steel. An oscillating current ought not to do that. Professor Ewin used an oscillating current to demagnetise steel. The charging of a Leyden jar illustrated the oscillating current. The charging was like lifting a rod suspended freely at one end to a horizontal position (the rod representing the charge). When the jar was discharged it was like releasing the rod; it must oscillate, and so must the electricity, and its oscillation would vary in accordance with the friction and other modifying causes. The greater the electro-magnetic inertia, the greater the oscillation. With regard to the protection of areas, the area which Mr. Preece admitted he protected was so small that they might give it him without discussion. There was, however, in his opinion no sure area of protection. Mr. Preece might have pressed him hard on the question of the conditions of a flash. He (the speaker) had assumed that the flash behaved as electricity did in an experiment. The cloud, however, was not like the tinfoil of a Leyden jar; it was made up of atoms with spaces between them, and a discharge might be more like that of a spangle jar, or might be dribbled away a bit at a time and not by great rushes. But

they could not assume that it would always do so, and must prepare for the occurrence of a great rush. The true character of lightning must be discovered by observing lightning, and not by experiments in a laboratory. The spark of one induction coil at a considerable distance would start another one sparking merely by its light. From that he came to the conclusion that when there was a very bright flash of lightning it must involve very important consequences. There was no doubt that it would cause discharges all over the charged area, and so he would say that areas of protection were misleading, and if a flash had that effect they had better be without any conductor at all.

The Hon. Ralph Abercrombie said there was no absolute evidence in photographs of flashes of lightning following each other rapidly on exactly the same path. There was, however, distinct evidence of the tendency of lightning flashes to occur parallel to each other. There seemed to be a tendency in lightning flashes to be ramified, to give off threads all round the main flash. Photography gave conclusive evidence that flashes were not so instantaneous as was generally supposed. It showed that the flash did not jump from a cloud straight to the earth, but went meandering through the air and tying itself into knots, so that it could not be so instantaneous as was imagined. He was of opinion that lightning clouds were generally more than 5,000 feet high, but there was no evidence of one of more than 7,000 feet high.

Lord Rayleigh said he thought that Professor Lodge's experiments would be a most important practical appreciation of lightning conductors in the future. Mr. Preece spoke of the development of energy by the condensation of vapour into water, but the question was to find how some of that energy came to take the electrical form. He believed that if Professor Lodge proceeded with his experiments, he would confirm his discovery that iron wire was a better conductor than copper. Self-induction was in the air, and they were talking of nothing else. He thought Mr. Abercrombie's idea as to the duration was correct. It seemed to him probable that it was the sound of one spark which caused another rather than the light. There was the photograph giving three parallel flashes. It would be well if some experiments could be made to discover whether flashes occurring like that were simultaneous or followed one another, being started by the light or sound vibrations of the first. It was rather startling to find that a lightning-rod had protecting power over so small an area, and he would like to ask Mr. Preece whether copper had been experimentally proved to be better than iron. They could come to one conclusion from what they heard, namely, that houses made of sheet-iron would be the safest possible places in a thunderstorm. The question of the effect of self-induction on static discharges was a very important one. He suggested as a class experiment the discharge of a Leyden jar through a number of students (1) when they were arranged in zigzag rows, so as to have no self-induction in the path of the discharge; and secondly, when they stood in a circle so that the self-induction of the path was a maximum. The students should stand on insulating material. He thought the result of such an experiment would be to show that the students in the middle of the chain would feel the effects of the discharge far less in the second instance than in the first. The most efficient protection for gunpowder against lightning would be, he thought, to put it in a house whose exterior was entirely of iron, and to put no lightning-rod on it.

Professor Rowland observed that the conditions of Professor Lodge's experiments were scarcely the same as those of actual lightning, and he pointed out that the length of the spark was no measure of the resistance of the conductor. Further, he showed some effects in Mr. Abercrombie's photographs, which were probably due to the astigmatism in the lens of the camera.

M. de Fonvielle said he, with Mr. Preece, was a supporter of the old lightning conductor theory, and he was partly led to that state of mind by the fact that there were large numbers of conductors in Paris, and there was very seldom an accident caused by lightning.

Professor G. Forbes said that Mr. Preece did not mean to say that mathematicians came to wrong conclusions when they had all the right data, but that they sometimes came to a conclusion without taking all the data into consideration. Professor Lodge had come to say that if iron was not better than copper, it was at least as good; but they could not be quite prepared to accept that, because the experiments might be tried in instances more nearly approaching the natural conditions, and in that case they believed copper would be found to be the best.

Sir J. Douglass said that his experience of lighthouses protected by lightning-rods covered a space of forty years, and was comforting to the members of the Lightning-Rod Committee. He never knew a rod fulfilling the conditions he prescribed to fail in protecting the lighthouse.

Professor Crum Brown suggested the use of revolving camera in taking photographs, in order to separate flashes, and thus see if each is single or not.

Mr. Sidney Walker said in the cases where damage had occurred, he believed that the result was due to a defect in the conductor. He pointed out iron would not stand the weather so well as copper, and that, besides, it would be affected by the gases at the top of a factory or similar place.

Mr. G. J. Symonds said he had investigated every accident by lightning of which he could hear, and had so got valuable experience. The conclusion left on his mind was that, if people would erect conductors precisely in accordance with the rules laid down by the conference, and fulfilling all the conditions, they would be absolutely safe.

Dr. Walker said he saw an obelisk on top of a hill struck. The top was knocked off and the fluid came from the steps of the monument at fourteen different points, ploughing up the ground, and breaking rock at 100 feet distance.

Professor Lodge said he could not understand why a conductor should have such a good earth. Why did not three points do at the bottom as well as at the top? He could not say that conductors were of no use; they were of great use, but not absolutely certain. In his experiment he was bound to adopt the plan he did, because the experiment could not be done in any other way. It was only the outer surface of the conductor which conducted, and he did not know that there was any good in the centre of a rod. A tube would do as well and would be all the better if opened out into a flat bar, and yet, better than that would be a strand of wires. Iron buildings, to be safe, must have perfect connections, for the smallest gap might give off a spark. That was the danger in houses supplied with gas; if the fluid travelled along the pipes and came to a gap a spark and explosion might result.

Mr. Preece said the points between Professor Lodge and himself were reduced to a very small compass indeed. He himself had always been a great advocate of iron on account of its cheapness. The use of copper caused needless expense in the erection of lightning conductors. He believed every private house could be protected in accordance with the recommendations of the conference for 1*l.*, if people would buy a coil of stranded iron wire a quarter of an inch in diameter with the final points, and have that put up.

#### MALDON.

A VISIT was made to Maldon by the Essex Field Club on Friday and Saturday last. At one of the meetings held in the Moot or Town Hall, a lofty red brick building, erected in the early part of the fifteenth century by Sir Robert D'Arcy, M.P. for Maldon in 1422, the Mayor, Mr. E. A. Fitch, read a paper under the title of "Short Notes on the History of Maldon." The town, he said, was founded nearly a thousand years ago—913-920 A.D.—by Edward the Elder, who chose for the site of his castrum a place formerly occupied by the Romans, but successively desolated by the Saxons and the Danes. Of Roman Maldon little was known, but the probabilities were that it was not a place of military importance; its claim to having been the Colona Camulodunum, and previously the royal town of Cunobelin, the capital of the southern part of the islands, could not be substantiated, but must be conceded to Colchester. Roman bricks, pottery, and coins had been found at various times in the neighbourhood. Truck loads of pottery had been turned up in the excavations for the new railway. A valuable gold coin found in and belonging to the town was shown. It was in good preservation, of the time of Agrippina junior and Nero, with their two heads on the obverse, and a male and female figure in a quadriga of elephants on the reverse. About the only record of Saxon Maldon was its name, from Mæl, across, and Dun, a hill. Although there was no history of the Danish conquest of Essex, it was known that here was one of the chief seats of the Danish power. In 921, after the massacre of Colchester, a large army of Danes unsuccessfully besieged the "Muldune" camp, and were repulsed with great loss by the Saxons. In the year 993, the Saxon Chronicle recorded that "this year came Unlaf with 93 ships to Staines, and laid waste all around, and thence he went to Sandwich, and thence to Gypswic (Ipswich), and harried it all, and so to Mældun, and then Brihtnoth, the Ealdorman, and his force came against him and fought with him, and there they slew the Ealdorman, and kept the battlefield. This great battle lasted for fourteen days, and there was a contemporaneous epic ballad describing it, which had been ranked "among the noblest efforts of Teutonic poetry." At the time of the Domesday survey, Mr. Fitch said, Maldon was a half hundred, like Ipswich. The borough belonged to the King, and the hall and houses were rented to the burgesses. The oldest charter dated from 1155, and was confirmed by Edward I., and as they were exempted from the usages of feudalism, which then pressed so hardly on the rest of the country, a Maldon freeman felt himself indeed a citizen of a great city. Having traced the later history of Maldon, when

the borough was shorn of some of its administrative privileges, the Mayor concluded by saying they would all wish that the ancient and loyal borough, which had left its mark on the history, especially political, of the county, might long continue to flourish.

#### Theatre Exits and Fire Risks.

SIR,—Having observed in the recent issues of your paper a number of letters on the above subject, and in one last week a request that I should explain the construction of the proscenium curtain for which I have obtained a patent, I submit the following particulars:—

The curtains are manufactured, under my patent, by Messrs. Clark, Bunnett & Co., Limited, and have been fitted up at the Theatre Royal, Eastbourne; the Alexandra, the Court, and the Shakesperian Theatres, Liverpool; and are now being fitted up at the Shaftesbury and the Lyric Theatres, London—the two last theatres now being erected from the designs of Mr. C. J. Phipps, F.S.A.

Perhaps I may be excused if I submit that this curtain is constructed in a manner as to afford the greatest protection against fire and the influence of heat; against smoke, the evil effects of which do not appear to be sufficiently recognised and against the falling timber or *débris*, which naturally takes place even at the commencement of a fire on a stage in cutting away scenery, &c.

The frame consists of a combination of T and L iron, running in a channel iron, which is fixed against the proscenium wall; this gives a fairly smokeproof joint, a matter of considerable importance. The outer frame of T iron is connected together with tubes and an interlacing of iron rods, and these are again strengthened by diagonal bracing, thus making the whole frame rigid, a matter of importance in a flat surface, say 35 feet square. To protect the ironwork from the influence of heat the whole is filled in and covered with "silicate cotton" or "slag wool," making a solid and rigid partition about 3 inches thick, fire-resisting as well as a non-conducting medium of heat and sound. The exterior is protected and stiffened by wire netting on each side, and the one towards the auditorium covered with green baize or any decorative treatment. Some of the curtains are worked by hydraulic power, others by hand power.

For the benefit of those who are not acquainted with the material "silicate cotton," I would observe that it is a fibrous product of blast-furnace slag, and is, from the nature of its formation, the best-known incombustible non-conductor of heat. I say "incombustible," as hair felt is an almost perfect non-conductor, but not fire-resisting, and so is left out of consideration.

Before deciding to employ "silicate cotton" I made a series of experiments, and came to the conclusion that it was the most effectual material which I could employ for the purpose, and from the experiments which were carried out in Southwark some time since my views have been confirmed in a manner most satisfactory, and I may say I look with some interest to see how the material will be taken up by the building world in general.

So much for the curtain which has been constructed according to my ideas. It is practically fireproof, smokeproof, heatproof, and soundproof; and if these facts were put before the theatre-going public, and they would only recognise them, one step would be gained towards the desired object, viz. that of avoiding panic, a far greater evil than fire, smoke, narrow passages, or bad staircases. To minimise the chance of panic I think the curtains already erected should be used more frequently between every act, so that even in the event of fire, and the curtain being lowered, the audience might not get what I may call "a scare," and, although they would be quite safe from fire, not understand it, and so make a stampede for the doors, with the result that some at least would be injured. I trust my description will be clear to your correspondents and that I have not been too long-winded in my views. Of course, in the progress of events, better curtains will be made some day, but at present I should prefer "the Protected Curtain" to be between a fire on the stage of a theatre and your obedient servant,

MAX CLARKE.

2 John Street, Bedford Row, W.C. :  
September 19, 1888.

[This correspondence will now cease.—ED.]

Sir George Stephen has announced his intention of building and endowing a cottage hospital at Dufftown, his native town, for the benefit of Mortlach and Glenrines parishes.

## NEW BUILDINGS.

**Coventry.**—Ground has been broken for laying the foundations of the proposed new theatre in Hales Street, Coventry, for Mr. William Bennett. The plans have been prepared by Messrs. Essex & Nicol, Birmingham, and Mr. C. Gray Hill, builder, of Coventry, has secured the contract for the erection of the building, the cost of which is estimated at about 4,000*l*. The area of the main body of the building will be 108 feet by 66 feet, in addition to which there will be refreshment-rooms and other conveniences. The stage will be 73 feet wide by 27 feet deep, with a good proscenium 24 feet wide. To the ground floor there will be three entrances from Hales Street, with a side entrance and a stage door; and there will be four staircases to the upper parts of the house and galleries. The size of the pit will be 48 feet 3 inches by 53 feet 9 inches.

**Glasgow.**—The memorial-stone of the new buildings for the Dennistoun Evangelical Union Church has been laid. The buildings, which are designed by Mr. Malcolm Stark, jun., I.A., Glasgow, are in the sixteenth-century Scottish style, in Ballochmyle red stone, and cost about 2,600*l*. The church, which will be handsomely finished, will accommodate about 550 sitters, and it will be provided with the usual halls, classrooms, &c.

**Harrogate.**—The foundation-stone of a Church Institute has been laid. The building is being erected under the superintendence of Messrs. H. E. & A. Bown, architects, of Harrogate. The style of architecture is late Gothic, the ashlar or stone used for the dressings is from the Killinghall quarries, tooled on the face; the wall stones are from the Rainton quarry, near Thirsk, skin bosted on face, and are laid in narrow courses. These being of a reddish colour are a strong contrast to the ashlar, which is nearly white, and give warmth and colour to the building.

**Sidmouth.**—New business premises for the Devon and Cornwall Banking Company at Sidmouth have been completed. The old quarters on the Esplanade proved inadequate to accommodate the increased business, and the new premises were consequently purchased. Important and extensive alterations were made from the designs of Mr. E. Lyne Parsons, of Exeter. The work has been done by Mr. M. W. Critchley, of Sidmouth.

**Tooting.**—A Roman Catholic college, erected on the Hill House estate, adjoining Tooting Graveney Common, has been opened. The highest point on the estate has been selected for the college buildings, which cover a ground area of 20,000 square feet, and rise in four storeys to a height of 74 feet. The buildings are in red brick and Portland stone dressings, the style of architecture being the French Renaissance. The buildings have a frontage of 196 feet, the central block being 130 feet in length and 52 feet in width, while the wings are 123 feet long and 33 feet wide. The chapel, on the first floor, is 80 feet long, 30 feet wide, and 35 feet high. The altar is in Caen stone, the altar table being of white veined marble, supported by four pillars of Irish marble. The building is heated by hot-water pipes, extending to a length of 2½ miles. The college has accommodation for 200 resident students and as many day students. Mr. W. Harvey, of Whitehall Place, is the architect, and Messrs. Higgs & Hill the contractors.

## CHURCH BUILDING AND RESTORATION.

**Edinburgh.**—A Roman Catholic church is to be erected in Upper Gray Street, and among the plans sent in in competition, those submitted by Mr. Rhoderic Cameron, architect, 130 George Street, Edinburgh, have been selected. The style of architecture adopted is a free treatment of Classic Renaissance.

**Lochearnhead.**—An Episcopal church erected at Lochearnhead has been opened. Mr. G. T. Ewing, Crief, is architect, and Mr. Angus, Lochearnhead, mason; Messrs. Taylor & Co., Blackford, joiners; slater, Mr. Williamson, Muthill.

**Rockwell Green.**—The foundation-stone of the new church has been laid. The church on plan is cruciform, 89 feet being the total length, and the width at the arms of the cross 50 feet, the height of the tower being 67 feet from the ground to the top of the pinnacles. The building will be of a substantial character, the walls generally being 2 feet 3 inches in thickness. The wall at the west end of the nave is to be 3 feet, while the walls of the lower stage of the tower are to be 3 feet 6 inches thick. The original contractors were Messrs. Verrier & Son, of Taunton, who obtained the contract in open competition, 2,765*l*. being the amount of their tender for the church, exclusive of the tower. Subsequently, on the failure of Messrs. Verrier, the contract was given to Mr. W. Templeman, also of Taunton. The architect is Mr. J. Houghton Spencer, of Taunton.

The New Guildhall at Nottingham is to be opened on Thursday next.

## GENERAL.

**Sir Frederick Leighton, P.R.A.**, arrived last week in Braemar, where he will probably make a lengthened stay.

**A Picture** by Teniers, worth about 1,000*l*., has been stolen from the Brussels residence of the Princesse de Ligne.

**The First Annual Exhibition** of the South Wales Art Society opened on Saturday with an admirable collection of pictures. The hanging committee were Mr. Parker Hagarty, R.C.A., Mr. S. W. Allen, A.R.C.A., and Mr. J. A. Sant, hon. sec., the general arrangement of the hall being carried out under the supervision of Mr. Edwin Seward.

**A Town Hall**, erected at Elland, from the designs of Mr. C. F. L. Horsfall, of Halifax, was opened on Wednesday. The building has cost 7,000*l*., and in the main hall there is accommodation for over 1,000 persons.

**Mr. Williamson, M.P.**, has offered 5,000*l*. towards the building fund of a new infirmary for Lancaster, and a site is to be purchased without delay. The infirmary is likely to cost from 10,000*l*. to 15,000*l*.

**The Church** of St. Michael and All Angels, Queenstown, Cape Colony, is to be extended by the addition of north and south transepts with porch, and raising of central tower. The nave portion was erected in 1882 from a design selected in competition, and furnished by Mr. W. H. Reid, of Standard Bank Chambers, Port Elizabeth, who has supplied plans for the present addition.

**A Memorial Archway**, designed in Greek style by Mr. Sydney Mitchell and carried out in red Dumfriesshire sandstone, has been erected at Blackford Hill, Edinburgh, to commemorate the late Sir George Harrison, formerly Lord Provost of the town.

**Messrs. Edwards & Sons**, Wolverhampton, have offered a prize of five guineas for the best landscape or figure-painting in oils of local origin, at the exhibition, which it is expected will be opened by Lord Dartmouth next week.

**The Scheme** for founding a Technical School for Bolton has been revived. Some time back the committee of the Bolton Mechanics' Institute offered to give their building, an offer equivalent to 5,000*l*., for the purpose.

**Mr. W. Oldham Chambers, F.R.I.B.A.**, has been appointed president on the jury of pisciculture at the Brussels Exhibition.

**Plans** have been prepared for a school to accommodate 250 boys, to be erected on a site purchased by the Exeter School Board from the trustees of Sandford's Charity.

**A Bazaar** was held last week in aid of the funds for restoring Ratlinghope Church, Salop, an ancient and interesting structure.

**The Grammar School**, at Stroud, after undergoing alterations and fitting up at a cost of 700*l*., was reopened on Saturday as a Free Library, in commemoration of the Queen's Jubilee.

**Mr. W. Leonard Grant**, architect, Sittingbourne, has drawn up a report after inspection of the condition of Milton-next-Sittingbourne parish church, the restoration of which it is proposed to take in hand.

**The Tunstall Jubilee Committee** have accepted tenders from Mr. T. Goodwin, of Tunstall, for the erection of a school of art for the sum of 4,135*l*., of the new baths for 3,890*l*., and of a town yard for 927*l*.

**A Bridge** over the river at Hull has just been opened, the cost, with approaches and property taken, being about 30,600*l*. It forms a direct means of communication between the centre and principal business portion of the town, and the main thoroughfare leading to the Victoria and Alexandra Docks, and is expected to relieve the traffic between the east and central districts of the town, which formerly had to pass over the North Bridge, higher up the river.

**The Excavations** commenced by Dr. Schliemann at Mycenæ are still being energetically carried on, and continue every day to bring to light fresh objects of archaeological interest. The entire terrain around the town is full of tombs belonging to an epoch antecedent to Homer. These pre-Homeric sepulchres are cut in the solid rock and carefully formed in regular compartments, with an area of from thirty-five to forty square metres. Articles of glass, crystal, and ivory, besides precious stones with engravings of animals charmingly executed, the character of which suggests that the ancient Greeks derived inspiration from the East, have been found.

**The East London Water Company** has been fined 5*l*., and in addition 20*s*. for nine days and costs, for not putting on a supply to two houses belonging to Mr. H. Johnson, of Limehouse, the reason for their refusal being that there was no storage cistern in either house. Mr. Lushington, however, decided that the cisterns, as provided with water-waste preventors, were sufficient receptacles for water.

**CRIMINAL PROCEEDINGS**, under the new Merchandise Act, will be instituted against any person falsely representing any form of ventilator to be a Self-acting Air-pump Ventilator, said title being registered and our Trade-Mark, applicable only to ventilators manufactured by us. Any infringement renders the person infringing liable to two years' imprisonment. ROBERT BOYLE & SON, LD.

### CONTRACTS OPEN.

**BELFAST.**—Sept. 24.—For Building Tower and Spire to Catholic Church, Holyrood. Mr. M. H. Thomson, Architect, 65 Upper Arthur Street, Belfast.

**BIDEFORD.**—Sept. 21.—For Widening Quay. Mr. Henry Chowins, Borough Surveyor, Bideford.

**BLACKFRIARS.**—For Building Shop and Premises. Mr. Thomas F. Shaw, Architect, Harlesden, N.W.

**BURNHOPE, DURHAM.**—For Building P. M. Chapel. Mr. W. T. C. Hallam, Architect, 56 Westgate Road, Newcastle-on-Tyne.

**BURTON-ON-TRENT.**—Sept. 27.—For Extension of Board Schools, Victoria Road and York Street. Mr. Reginald Churchill, Architect, St. Paul's Square, Burton-on-Trent.

**CLEATOR MOOR.**—Sept. 28.—For Alterations in Birks Road. Mr. J. S. Moffat, Architect, 53 Church Street, Whitehaven.

**COLYTON.**—Sept. 24.—For Alterations and Repairs to the Colcombe Castle Hotel. Messrs. Pinney, Son & Farmer, Architects, Axminster.

**DUBLIN.**—Sept. 25.—For Construction of Four Iron Street Bridges. Mr. E. Maunsell, Secretary, Westland Row Terminus, Dublin.

**EXETER.**—Sept. 24.—For Construction of New Drainage Works at the City Workhouse. Messrs. Wilkinson & Warren, Surveyors, Post Office Chambers, Exeter.

**EXETER.**—For Alterations at the Half Moon Hotel. Mr. E. H. Harbottle, Architect, County Chambers, Exeter.

**FARSLEY.**—Sept. 21.—For Building Stockrooms, Offices, &c. Mr. C. S. Nelson, Architect, Albert Chambers, Park Row, Leeds.

**FELTWELL FEN.**—Sept. 29.—For Building Board School, &c. Mr. E. N. Cole, Bury Road, Thetford.

**FINSBURY PARK.**—Oct. 2.—For Building Store Shed. The Superintending Architect, Metropolitan Board of Works, Spring Gardens.

**GREAT WAKERING.**—Sept. 21.—For Additions, &c., to Board Schools for 120 Children. Mr. Walter J. Wood, Architect, 1 Sussex Terrace, Southend, and 1 Finsbury Circus, E.C.

**HALIFAX.**—Oct. 1.—For Building Restaurant, Southgate. Messrs. Jackson & Fox, Architects, 22 George Street, Halifax.

**KESWICK.**—Sept. 28.—For Enlarging Chancel and Building Organ Chamber, St. John's Church. Mr. W. Marshall, Architect, 28 Bedford Square, W.C.

**LLANELLY.**—Sept. 28.—For Building Sunday Schoolroom. Mr. H. Dawkin Evans, The Graig, Llanelly.

**LLAMSHEN.**—Sept. 24.—For Building Two Residences. Mr. W. I. Grylls, Architect, 65 St. Mary Street, Cardiff.

**MANCHESTER.**—For Parish Rooms, St. Matthew's, Ardwick. Mr. Medland Taylor, Architect, 2 St. Ann's Churchyard, Manchester.

**NEWCASTLE EMLYN.**—Sept. 30.—For Building House. Mr. J. Jones, Lloyd Terrace, Newcastle Emllyn.

**NEWCASTLE-ON-TYNE.**—Sept. 24.—For Alterations to Premises, Scotswood Road. Messrs. S. Oswald & Son, Architects, 2 St. Nicholas Buildings, Newcastle-on-Tyne.

**NORTH SHIELDS.**—Oct. 3.—For Construction of Passenger Station. Mr. Wm. Bell, Architect, Central Station, Newcastle-on-Tyne.

**OSSETT.**—Sept. 28.—For Building Offices, &c., Bottom Field Mills. Messrs. Holtom & Fox, Architects, Westgate, Dewsbury.

**PETERBOROUGH.**—For Building Three Cottages. Mr. J. G. Stallebrass, Bamber Street, Peterborough.

**PETERBOROUGH.**—For Building House in Broadway. Mr. H. M. Townsend, Architect, The Precincts, Peterborough.

**QUEENSBURY.**—Sept. 29.—For Combing Shed at Bradshaw Mills. Mr. John Drake, Architect, Winterbank, Queensbury.

**RATCLIFF.**—For Building Block of Warehouses, London Street. Mr. Joseph Sawyer, Architect, 63 Chancery Lane, W.C.

**RISHWORTH.**—Sept. 24.—For Building Cottage at Waterworks. Mr. C. J. Hudson, Town Clerk, Wakefield.

**ROMFORD.**—Sept. 24.—For Reconstructing Fittings and Drainage Works at the Workhouse. Mr. C. J. Dawson, Architect, East Street, Barking.

**ROTHERHAM.**—Sept. 28.—For Building Grain Warehouse. Mr. E. Ross, Secretary, London Road Station, Manchester.

**SALCOMBE.**—Sept. 22.—For Building Chancel and Porches to Church. Mr. J. May, Courtenay Street, Salcombe.

**SCARBOROUGH.**—Sept. 21.—For Building Three Cottages, Quay Street, Sandside. Mr. John Petch, Architect, Bar Street, Scarborough.

**SEATON SLUICE.**—Oct. 5.—For Building Two Coastguard Houses. The Director of Works Department, Admiralty, 21 Craven Street, Charing Cross.

**WEST BECKHAM.**—Sept. 22.—For partly Rebuilding Workhouse. Mr. J. S. Plumbly, Southrepps.

### TENDERS.

#### ALDERSHOT.

For Carrying Out Shone's System of Drainage for Western Portion of Aldershot. Mr. W. L. COULSON, Surveyor.  
Hughes & Lancaster, Chester . . . £1,000 0 0

**AXMINSTER.**

For Alterations and Additions to the Red Lion Hotel, Axminster, for Messrs. S. & W. T. Toms, Brewers, Chard. Messrs. PINNEY, SON & FARMER, Architects and Surveyors, Axminster.  
Parsons & Perryman, Axminster . . . . . £68 1 6

For Altering and Remodelling First Presbyterian Church, Ballibay.  
J. Irwin, Ballibay . . . . . £340 0 0  
W. WATSON, Castleblayney (*accepted*) . . . . . 321 0 0  
J. Maguire, Newtonbutler . . . . . 288 0 0

**BRADFORD.**

For Erection of Five Houses and House and Shop at Laisterdyke. Mr. G. C. GAMBLE, Architect, 225 Leeds Road, Bradford.

*Accepted Tenders.*

W. Totty, Manningham, mason.  
Wilkinson & Kellet, Horton, joiner.  
Hill & Nelson, Bradford, slater.  
M. Slinger, Bradford, plumber.  
T. Bolton, Bradford, plasterer.  
F. Clapham, Bradford, painter.

For Additions to Laisterdyke Post Office. Mr. G. C. GAMBLE, Architect, Bradford.

W. Hinchcliffe, Thornbury, mason.  
Schofield & Gibson, Thornbury, joiner.  
Hill & Nelson, Bradford, slater.  
W. Watson, Laisterdyke, plumber.  
J. Wheeler, Laisterdyke, plasterer.

For Alteration of Old Post Office Buildings into Shop and Offices, for Messrs. G. Brown & Son. Messrs. MILNES & FRANCE, Architects, Bradford.

*Accepted Tenders.*

Bairston, Shipley, mason.  
Wilson & Son, Bradford, joiner.  
Taylor & Parsons, Bradford, ironfounder.  
A. Barber, Bradford, plumber.  
P. Holdsworth, Bradford, plasterer.  
T. Nelson, Bradford, slater.

**BRENTFORD.**

For Widening Windmill Road. Mr. LACEY, Surveyor, Brentford.

G. Gibson, Southall . . . . .	£965	5	0
Gregory & Co., Clapham . . . . .	857	0	0
T. Adams, Kingsland . . . . .	796	3	2
T. Anthony, Brentford . . . . .	759	14	4
G. Bell, Tottenham . . . . .	752	12	1
W. PARKER, Brentford ( <i>accepted</i> ) . . . . .	741	0	0
J. Barnes, Brentford . . . . .	729	3	6
Rackham & Co., Colchester . . . . .	715	0	0
C. Beach, Brondesbury . . . . .	694	16	3

**CHELMSFORD.**

For Erection of Vestry Hall in New Street, Chelmsford, for the Parish Officers. Mr. F. WHITMORE, Architect.

H. Potter . . . . .	£476	0	0
C. J. BAKER * . . . .	456	0	0
A. Roper . . . . .	455	0	0
G. Beaumont . . . . .	432	0	0
Mrs. Moss . . . . .	429	0	0
W. Fincham . . . . .	419	0	0
Frank Johnson . . . . .	377	0	0

\* Accepted from revised plans.

**CLONMEL.**

For Building Catholic Chapel to accommodate 400 persons, at Clonmel District Lunatic Asylum.

Reade & Sons, Kilkenny . . . . .	£2,763	6	4
J. Delaney & Co., Cork . . . . .	2,574	12	1
J. J. Pile, Dublin . . . . .	2,550	0	0
M. Hunt, Waterford . . . . .	2,517	15	8
R. & G. Cussen, Templemore . . . . .	2,453	0	0
J. Newstead, Fermoy . . . . .	2,424	10	0
W. T. Mackey, Donoughmore . . . . .	2,407	0	0
D. Creedon, Fermoy . . . . .	2,291	6	8
T. Williams, Borrisoleigh . . . . .	2,240	0	0
P. DWYER, Clonmel ( <i>accepted</i> ) . . . . .	2,134	3	3

**DORCHESTER.**

For Laying Sewer in Weymouth Road, Great Western Road, and Cornwall Road. Mr. F. T. MALTBY, C.E., Borough Surveyor, Dorchester.

H. Testy, Weymouth . . . . .	£268	0	0
WHETHAM & SON, Weymouth ( <i>accepted</i> ) . . . . .	245	0	0

# IMPORTANT NOTICE TO EXHIBITORS.

A large Permanent Building Exhibition is about to be opened near the great centre of all the Metropolitan traffic. A Prospectus will be forwarded on application to ROBERT ADAMS.

## ADAMS' EMPORIUM, PERMANENT EXHIBITION, AND MART OF IMPROVED BUILDING & ALLIED TRADES APPLIANCES, 67 NEWINGTON CAUSEWAY.

Two minutes from the Elephant and Castle, five minutes from London Bridge. Fares, 1d. and 2d. from E.C., W., S.W., and S.E. districts. Early application is imperative. This invitation applies only to those who have goods of recognised merit.

### FURTHER IMPORTANT NOTICE.

The Business of ROBERT ADAMS, Engineer, Patentee of Door Springs, Secure Fanlight Opener, &c., will henceforth be carried on at the above premises, where all orders should be sent. The profession and trades will kindly note that this business is now REMOVED from Great Dover Street and Blackman Street.

GRIMSBY.

For Forming Roads and Footwalks on Site of proposed new Cemetery, Scartho Road, Grimsby. Mr. JOHN BUCHAN, Borough Surveyor.

J. Garner, Grimsby . . . . .	£3,855	12	0
C. Simons, Grimsby . . . . .	1,625	0	0
A. F. James, Cleethorpes . . . . .	1,618	0	0
Hewins & Goodhand, Grimsby . . . . .	1,389	10	0
F. ENDERBY, Grimsby (accepted) . . . . .	1,159	10	0

HAVERHILL.

For Erection of New Corn Exchange, Haverhill, Suffolk, for the Board of Directors. Mr. F. WHITMORE, Architect, Chelmsford.

Everett & Son, Colchester . . . . .	£1,473	0	0
C. E. Orfeur, Colchester . . . . .	1,398	0	0
Grimwood & Son, Sudbury . . . . .	1,395	0	0
Mason & Son, Haverhill . . . . .	1,329	0	0
F. Dupont, Colchester . . . . .	1,275	0	0
A. DISS, Colchester (accepted) . . . . .	1,250	0	0

HIGHWORTH.

For New Shop Front, &c., High Street, Highworth, for Mr. G. Yeates. Mr. WILLIAM DREW, M.S.A., Architect, 22 Victoria Street, Swindon.

J. THOMAS, Highworth (accepted).

HURST.

For Erection of a Dwelling-house, Turner Lane, Hurst, for Mr. S. Sidebottom. Mr. J. H. BURTON, Architect, Ashton-under-Lyne.

W. Clough, Ashton-under-Lyne . . . . .	£445	0	0
J. Whatmough, Hurst . . . . .	444	10	0
J. W. Williamson, Ashton-under-Lyne . . . . .	438	0	0
J. Gibson, Dukinfield . . . . .	416	0	0
W. Tickle, Dukinfield . . . . .	414	10	0
Fitton & Bowness, Ashton-under-Lyne . . . . .	414	0	0
J. Garside, Ashton-under-Lyne . . . . .	411	0	0
C. Morris, Ashton-under-Lyne . . . . .	399	0	0

IN reference to the article on the rain-water separator in *The Architect* of last week, Mr. C. J. Roberts writes to us asking us to draw attention to the advantages of the new form of "Horizontal Separator," illustrated and described in that article. The rain-water separator is well known, and in case these material improvements may be overlooked, it may be briefly stated that the special advantage of the new form of separator is that it occupies much less vertical space than the previous forms. Thus for roofs of 1,801 to 2,800 square feet area the inlet had to be 26 inches above the outlet pipe for pure water, while with the new separator it need be only 6½ inches above it. A space of 6½ inches between the rain-water pipe and the overflow-pipe of the tank can generally be obtained without difficulty.

THE latest scheme for testing drains is related of a man in Chicago, who, having reason to suspect that the house drains were defective, threw the entire establishment open to the inspection of his cat, and then poured a strong infusion of valerian into the pipes, with the result that the leaks were soon discovered by the animal.

THE Parish Offices, Dudley, are warmed and ventilated by means of Shorland's patent Manchester grates, supplied by Mr. E. H. Shorland, of Manchester and London.

MESSRS. HAYWARD TYLER & CO., of 84 Whitecross Street, London, E.C., now undertake the complete fitting up of private houses, public buildings, factories, &c., with the electric light. The department is under the charge of Mr. C. P. Hammond, an experienced electrician, and they will be glad to receive inquiries from architects requiring such work done.

AT the meeting of the Glasgow School Board on Monday it was reported that a site had been purchased for a new school in Napiershall Street, and also that it had been decided to erect science, drawing, and cookery-rooms in connection with John Street School.

IN his annual report Dr. J. B. Russell, the medical officer of health, Glasgow, writes:—"I have just received from Mr. Henry, the city assessor, the return of inhabited houses within the municipality, as at June 1 last, from which I annually make my estimate of the population. The number of occupied houses was 114,863, which, multiplied by 4.745 (the average number of inhabitants per house in 1881), gives 545,025 persons. Adding to this 6,410, the number of inmates in institutions, as ascertained by special census, I find that the total population of Glasgow, as estimated from the occupied houses, on June 1,

1888, was 551,435. This, as compared with last year, shows an increase in houses of 1,515, and in population of 7,440 souls. It would appear that, after increases alternating with decreases during the previous four years, last year the population increased at nearly 3½ times the rate of growth between 1871 and 1881."

A LARGE clock, striking hours, chiming the Westminster quarters, and showing time on two large dials, has just been erected at Willey Park, Shropshire, to the order of Lord Forester, by Messrs. John Smith & Sons, Midland Clock Works, Derby. It is fitted with all the latest improvements and is expected to go with extreme accuracy.

THE sub-committee of the York Corporation have visited Manchester to inspect the action of automatic and other sprinklers, and it is probable that in consequence of the satisfactory experiments they witnessed they will recommend the adoption of sprinklers in some form at York Theatre, which is now undergoing alterations, to provide for the safety of the public in case of fire or panic.

A GREAT improvement is reported of late in the imported timber trade. Prices of red and yellow pine, pitch pine, and spruce deals have practically doubled within a few months. This has been caused to some extent by the great increase in freights in shipping. Large stocks of timber are not held in this country, and this increase in price has brought about a corresponding increase in the values of those British timbers which are used for similar purposes, as red and yellow pine, pitch pine, and spruce deals. There is every prospect of this improvement being maintained for some months to come, and it is thought it will tend to check the importation of timber from foreign countries till the market gets to a more evenly balanced position.

AN ingenious and effective reversible window has been patented by Mr. James Millar, of Newcastle-on-Tyne. In view of the dangers and numerous fatal accidents caused through cleaning windows from the outside, every additional appliance that tends to safeguard life is welcome. There is a wide field open for such appliances in all buildings, more especially in such buildings as hotels, colleges, schools, asylums, &c., that have windows of high elevation. The chief points aimed at have been simplicity and minimum of cost, which latter does not exceed that of the windows now in use. It can also be applied to any form of window, and existing windows can be altered and adapted in a few hours at a small cost. The win-

dows are self-balanced, so that they can be opened to any distance for ventilation, and when closed are both air-tight and water-tight, and a person can clean, paint, glaze, or repair them standing in the inside of the room with absolute ease and safety.

THE brick trade at Oldbury is reported to be in a flourishing condition, and some of the manufacturers in the locality have secured some large orders. One firm has received an order which will keep their large works fully employed for over twelve months. There is also lately great activity in the iron trade, and some works which have been closed for a number of years are on the eve of being restarted; and it is stated that new industries will be shortly introduced into the town, prominent amongst which will be new rolling mills at the Aluminium Works.

THE members of the Association of Birmingham Students of the Institution of Civil Engineers on Friday made an inspection of the engines, machinery, and other works at the dépôt of the Hockley Cable Tramways. They also inspected the works now in progress in the extension of the system to New Inns, Handsworth. The party was conducted over the works by Mr. A. W. Pritchard, in the absence of the engineers.

At the meeting of the Dundee Town Council last week a proposal was made in favour of erecting a parapet wall and railing round the town's churches, and planting the grounds with trees and shrubs. On the other hand it was said that the first consideration ought to be to put the churches in proper repair, as the state of the masonry was a discredit to the town. It was remitted to the town architect to report as to the renovation of the masonry and the cost of erecting a parapet wall and railing round the churches. A committee was also appointed to consider as to the beautifying of the grounds.

THE Dean of Guild Court, Maryhill, Glasgow, on Friday sanctioned the erection of a new wing to the premises of Paterson's Chemical Manufactory Company, 150 feet in length by 64 feet in breadth.

ON Friday, at a meeting of the Smethwick Local Board, it was reported that the award of Mr. Till, the Birmingham borough surveyor, had been received with regard to the Handsworth and Smethwick joint-sewerage accounts, certifying that the total amount payable by Smethwick was 14,046*l.* 19*s.*, and to complete that amount Smethwick had yet to pay 1,545*l.*, and in addition 75*l.* for charges. These terms were considered to be favourable to Smethwick.

THE ceremony of cutting the first sod of the Belfast Main Drainage Works has been performed at Thompson's Bank, Duncrue Street, by Mr. William M'Cammond, J.P., chairman of the Town Improvement Committee. The cost of the works is estimated at 300,000*l.*

THE contract has been, it is stated, obtained by Mr. Walter Scott, contractor, Newcastle-on-Tyne, for the extensive works in connection with the rebuilding and rearrangement of the Central Station, for the directors of the North-Eastern Railway.

ON Saturday a memorial marble credence-table, piscina, and aumbrey, which have been erected on the south wall of the sanctuary of St. Paul's Episcopal Church, Dundee, executed by Messrs. Farmer & Brindley, London, were dedicated.

EXTENSIONS to Leeds Infirmary are contemplated, and 30,000*l.* will be required to carry out the work. Colonel North has given 5,000*l.*, and other sums are promised towards the building fund.

AT Olanteigh Towers have been erected a series of three new picture galleries, which will rank amongst the finest in this country, the architect being Mr. Grant, of Sittingbourne; and special attention has been paid to the ventilation, which is effected on the Boyle system, the latest improved form of the self-acting air-pump ventilator being adopted for the extraction of the vitiated air, fresh air being admitted by Boyle's improved air inlets.

THE Paris correspondent of the *Daily News* says that, on Tuesday afternoon, 110 out of the 114 rivetting workmen engaged in adjusting the iron girders and plates of the Eiffel Tower decided not to return to their work, and mean not to resume it until they obtain an addition to their wages of two-pence an hour. The reason they give is that the higher the tower grows the greater the risk becomes of working on it. It is now over 475 feet in height. M. Eiffel offered them a halfpenny an hour more, but this was refused. The average wage is 5*s.* 11*d.* per day of eleven hours.

THE annual report of Mr. James Lovegrove on the works executed during his thirty-second year of office, as chief surveyor to the Board of Works for the Hackney district, gives an exhaustive account, in lucid and concise form, of the works carried out, and the working expenses, including such matters as lighting, watering, painting, &c., materials, and labour. It appears that the extension of streets, sewers, and houses has continued to so great an extent that there are now 99 miles in length of roads and streets under the care of the Board as

against 31 miles in 1856, and the total cost of the works executed by the Board during the year under the department has been about 53,000*l*. During the year notices have been received of intention to erect 320 additional houses, besides other buildings; also to form 1½ mile of new streets, and to construct 3,739 lineal feet of new sewers.

#### NEW CATALOGUE.

A TASTEFUL little price-list, under the title of "Hildesheimer & Faulkner's New Publications for the Season 1888-89," has been forwarded to us. The aim in preparing the new publications has been throughout to render them not only artistic but popular. In Christmas cards, books, and booklets, photographic opals, &c., the old lines have in a great measure been departed from, and Messrs. Hildesheimer put them forward for the market with every confidence as both good and novel for the Christmas season. For these and New Year cards two sample books are issued. In the first, book-shaped cards are a prominent feature of novel and graceful forms. The second includes the Cameo and Wedgwood series, harmonies in embossed bronzes, diamond and pearl embossed cards, and private and autograph folding cards in fancy forms.

#### PURIFICATION OF THE THAMES.

IN the recently-published report, the Metropolitan Board of Works give an account of their stewardship anent the disposal of London sewage. The Royal Commissioners, the report states, were of opinion that the only effectual way of attaining complete immunity from smell, after precipitation of the solid matter, was to further purify the liquid by a process of filtration through earth, and they advised that such a process of filtration should be adopted if it were decided to discharge the sewage effluent into the Thames in the neighbourhood of the present outfalls. The acquisition of sufficient land, however, in the neighbourhood of Barking and Crossness to enable the vast quantity of London sewage to be effectively filtered through the soil, was found upon examination to be attended with such great difficulty, to say nothing of cost, that the Board conceived it to be its duty to endeavour, under competent advice, to find some other method sufficiently effective to obviate the necessity of earth filtration.

What was required seemed to be an oxidising agent which would not only effect the immediate destruction of any offensive odour still remaining after chemical precipitation, but which would at the same time prevent the development of noxious gases. It was found that permanganic acid was effectual in accomplishing both these objects. The Board was extremely anxious that there should be no mistake in the conclusion arrived at upon this important point, as upon it would mainly depend the determination of the course to be taken. The Board accordingly again sought the opinion of the four eminent chemists who had advised upon the method of precipitation. They all, after careful observation of the experiments made, gave it as their opinion that if the liquid resulting from precipitation with lime and proto-sulphate of iron were subsequently treated with manganate of soda and sulphuric acid, it would be deodorised and purified to such an extent as to render its discharge into the river unobjectionable at all states of the tide.

With this authoritative opinion before it the Board felt that the filtration difficulty might be regarded as overcome, and that it might safely be concluded that the adoption of the process of precipitation, with the further resort to permanganic acid in hot weather, as proposed, would effectually render the discharge of the sewage into the river innocuous and inoffensive all through the year. This conclusion arrived at, the Board proceeded at once to act upon it, and ordered plans to be got ready for the works necessary to enable the process to be brought into operation. The plans for the works at Barking, the site of the outfall on the north side of the Thames, were first prepared; and in January 1887, a tender was accepted for the execution of the works for the sum of 406,000*l*. The plans for the permanent works at the Crossness outfall, on the south side of the river, are in a forward state of preparation. While the permanent works at Barking have been in progress, the experimental operations at Crossness have continued to be carried on. The total quantity of sewage treated during the year just ended has been a little over 2,000,000 gallons. The wet sludge obtained therefrom amounted to 62,000 tons, which on further settlement in the subsiding tanks, was reduced to 41,000 tons. Of this quantity 39,556 tons was pressed into 14,401 tons of sewage sludge cake, the remaining 1,444 tons being treated for experiments in various ways. About 10,985 tons of the cake has been delivered into trucks at the Abbey Wood Station of the South-Eastern Railway, or into vessels alongside the Board's wharf at Crossness,

Of Thoroughly Seasoned Wood, cut Mathematically Accurate, by Special Machinery.

Geary's Patent "Invincible" System.

Every Block double-keyed to the Substructure.  
Metal Keys.  
BLOCKS IMMOVABLE.

Speciality: OAK and DARK OAK. Over a Million Feet in Stock, Thoroughly Seasoned.

Quotations, Samples, and all Particulars on Application.

Only Address: 22 & 24 CHARING CROSS, LONDON, S.W. WEST HARTLEPOOL. WORKS

"THE WEAVER," "THE IMPERIAL," & "THE OXFORD," Patent Sanitary and Ventilating Appliances.

The "LONDON" CLOSET, 7s. 6d. Tank and Fall Pipe, 15s.

The "IMPERIAL" CLOSET, 15s. 6d. 3-gal. Cast-Iron Tank and Fall Pipe, 25s. 6d. White Glaze from 7s. 6d.

The "INTERCEPTOR" SELF-CLEANSING TRAP, 10s. 6d. and 15s.

The "IMPERIAL" EXHAUST VENTILATORS for Roofs and Soil Pipes, and Chimney Cowl, from 12s. 6d.

CHIMNEY-BREAST OUTLET VENTILATOR, from 4s. Inlet Tubes from 15s.

STEEL SINK, from 6s. 6d.

WATER CLOSET SLOP-RIM and URINAL, 6s. 6d.

TRAPPED RAIN-WATER HEAD, 10s. and 12s. 6d.

The "OXFORD" WASH-AWAY CLOSET, 15s. and 20s.

The "COMBINATION" CLOSET, 15s. and 20s.

NOTE.—All Closets are fitted with the "Weaver" Flush Fan, with Waterfall Action. (The "Weaver" Flush Fan being adaptable to ALL KINDS of Closets, Licenses may be granted to Manufacturers.) The Flush Tanks are noiseless. There is greater flushing and cleansing power than in any other closet. Trappage up to 3in. With a supply of the iodate Sanitary Salt to the Tanks, these Closets are odourless. Lead Closet Traps or boarded floors, 7s. 6d. and 10s. 6d. Ball Valves to Flush Tanks for quick filling under low pressures. 3in., 2s. 6d.; 3in., 3s. 6d.; and Stop-cock, 3s. 6d.

N.B.—The Interceptors and all other Traps are absolutely self-cleansing, and dispense with grease collectors. Illustrated List, also "Instruction in Sanitary Construction" (Domestic Section, abbreviated), and "Memorandum on House Sanitation and the Law of Landlord and Tenant thereon," by R. Weaver, C.E., F.C.S., Sanitary Surveyor, free by post.

The Domestic Engineering and Sanitary Appliances Company, 24 High Holborn, London, W.C.

free of charge to farmers and others who have applied for it for experimental use in agriculture.

As regards the permanent method of disposing of the sludge, it may be mentioned that the Royal Commission suggested that it could be applied to the raising of low-lying lands, or burned, or dug into land, or carried away to sea. The Board having considered with care these various suggestions, came to the conclusion that the only practicable course, in the case of the metropolis, was to carry the material away and cast it into the sea, unless it should fortunately turn out that the sludge could be applied with advantage for agricultural purposes. As, however, the Board felt that, even in the most favourable circumstances, considerable time must elapse before the merits of the sewage-sludge as a manure could be so widely recognised that farmers would be found ready to take the whole of the supply off the Board's hands, and as it was necessary to provide for its removal at once, the Board gave directions for a vessel to be specially constructed for the purpose of carrying the sludge out to sea and there discharging it. The vessel was built by the Barrow Shipbuilding Company at a cost, including fittings, of 16,952*l.* 10*s.* It was launched from the company's yard at Barrow-in-Furness on May 25 last, and arrived in the Thames, off Erith, on June 29 following. The vessel will carry the sludge at such a level that it will have a sufficient head of discharge when the vessel is loaded, the head being maintained by the rising of the lightened vessel as the sludge flows out.

During the long-continued hot and dry weather of the past summer it was found necessary (as in the previous year) to deodorise the sewage at the two main outfalls, before allowing it to pass into the river. The Board, thinking it desirable to obtain the opinion of some leading chemist who had not previously been consulted on the subject, had recourse to Sir Henry Roscoe, and under his advice chloride of lime and, subsequently, manganate of soda with sulphuric acid, were used at the outfalls. In the years 1885 and 1886 the Board had, with a view to checking the development in the sewers themselves of the injurious compounds which are generally known as sewer-gas, introduced during the summer months deodorising materials into the sewers at the intermediate pumping stations at Pimlico, Deptford, Battersea, and Vauxhall, and at other places in different parts of London. The cost of thus treating the sewage in the sewers was very large, and the question was raised whether the results were worth the expenditure, and whether equally good results could not be obtained by some

less expensive method. Upon this point also Sir Henry Roscoe was consulted, and, under his advice, the Board discontinued putting manganate of soda and sulphuric acid into the sewers, and reverted to a process which had been tried in the years 1870 and 1871, and had since fallen into disuse, the process being to neutralise the offensive gases, as they rose through the ventilating shafts, by an application of sulphurous acid. The Board accordingly, early in July last, gave directions that, whenever complaints were received of offensive odours being emitted from any of the ventilating shafts of the sewers under the Board's control, sulphurous acid should be applied. Under these instructions 146 ventilators to the sewers on the north side and forty-eight to those on the south side of the river Thames were so dealt with, at a cost of about 600*l.*

#### STATISTICS OF VISION AND COLOUR SIGHT.

AMONG the papers submitted at the meeting of the British Association was one by Mr. G. W. Bloxam relating to observations made by himself and Dr. J. G. Garson. It appeared that observations as to the colour of the eyes were taken of 200 people, 102 men and 98 women, but it had been impossible to classify them. As to the keenness of eyesight, the average who attended for the purpose was—in men, the right eye could see diamond type at a distance of 19·6 inches, and the left at a distance of 18·2 inches. There was a distinct difference between the right and left, and also a similar difference among women, who with the right eye saw at a distance of 19·2 inches, and with the left 18·7. The age of the men examined averaged 41·7 years, whereas that of the women was between 23 and 25. In no case could any man see more than 34 inches with the right eye, but with the left, curiously enough, one could see beyond that distance. The right eye was equal to the left eye in 26 instances in the men and in 31 in the women; in 35 cases among the men and in 28 cases among the women the right eye could see further than the left, and in 24 cases in the men and 28 cases in the women the right eye was worse than the left. Only one case of absolute colour-blindness was found among the 200 individuals; that was in the case of a Jew, and was rather less than might be expected. In the general population of Great Britain 4·16 per cent. were colour-blind, but among the professional classes the percentage was only 2½ per cent., while among the Jews colour-blindness was rather more frequent—4·9 per cent.

## THE MANCHESTER SHIP CANAL.

THE valley of the Irwell, from Salford to Cadishead, the *Manchester Guardian* says, now presents one continuous scene of activity. At Partington, on the Cheshire side of the river, a large cutting is being made to divert the Mersey into the Irwell at a point opposite Irlam known as Sandywarp. This will afford the contractor another "great tip." On this section there are four locomotives at work. A ballast line has been constructed from Irlam station on the Cheshire lines to Flixton, where a number of workmen's dwellings have been erected. Here there are five locomotives, and on both sections there are engine-sheds, offices, and hospitals for disabled workmen. A portion of the engine-sheds at Skeer Rock, Cadishead, have been removed to Partington, and the pay offices have been converted into workmen's dwellings. The locomotives stationed here, seven in number, run as far as Latchford, Cheshire, a track bridge having been constructed across the Irwell at Rixton. A portion of the Irwell has been filled up near Stickins Island, and where the locks will be situated the depth of the canal has been reached. On the southern side of the river at Barton piles are being driven into the water, so as to form a track railway, which will run under the southern arches of the aqueduct and Barton Bridge, by which the ballast lines in the meadows east and west of Barton locks will be connected. At various points in the river track bridges are being constructed, so that through communication by rail may be established between Salford and Eastham.

## PUBLIC WORKS IN LONDON.

THE report of the Metropolitan Board of Works states that two additional improvement schemes under the Artisans and Labourers' Dwellings Improvement Act, 1875, were approved by Parliament last year—244 blocks of buildings have now been erected by the Board under the Act, and dwelling accommodation has been provided in them for about 26,000 persons. Apparently this work proceeds very slowly. It appears that the bridges acquired by the Board under the Act of 1877, and which are now maintained free, have cost a million and a half sterling. These are Waterloo, Lambeth, Vauxhall, Chelsea, Albert, Battersea, Wandsworth, Putney, Deptford Creek, Hammersmith, and Westminster. The London, Southwark,

and Blackfriars Bridges are under the control of the City Corporation. The ground at Hammersmith, known as Ravenscourt Park, is the only actual addition to the public pleasure grounds of London during the twelve months. But Victoria, Battersea, and Kennington Parks have been transferred to the Board, and also Wandsworth Common. The total area of parks, gardens, and open spaces under the Board's control is now 2,603½ acres. To this the chief contributors are Blackheath (267 acres), Victoria Park (244 acres), Hampstead Heath (240 acres), and Battersea Park (198 acres). Ravenscourt Park cost 58,000/. Once more assurance is given that precautions against floods are well-nigh completed. New large sewers intended to supplement some of the sewers of the main drainage system, which were found inadequate to carry off with sufficient rapidity the enormous quantity of water which found its way into them at times of heavy rain, have been constructed. Four miles of new sewers have been made in the neighbourhood of Hackney Road at a cost of 78,500/. The small new pumping station in the Isle of Dogs is calculated to cost over 21,000/. Nearly a thousand wharf-owners on the river have complied with the directions of the Board to raise the banks so as to prevent the overflow of the Thames. In the report concerning fire and fire-brigades, it is stated that the funds are still insufficient to supply all the wants of the Metropolis, "so that any enlargement or strengthening of the brigade is at present out of the question." Fifty-five lives were lost last year by fire, and 198 lives were seriously endangered. The number of calls was 3,059, the serious fires amounting to about 7 per cent.

## TECHNICAL EDUCATION FOR ENGINEERS.

A SPECIAL committee of the Manchester Association of Engineers have prepared a course of study for youths engaged in engineering workshops, with a view to enable them to become efficient workmen, and to prepare them, when their practical experience is matured, to hold good positions in the various departments of engineering. A course of reading by steady work in evening classes is indicated, and for the purpose of systematic study—in which progress can from time to time be tested by a graduated course of examinations—and also to enable students to take advantage of the very favourable terms offered by the Government, the syllabus has been arranged on the basis of that of the Science and Art Department. Another reason why the classes in connection with the Science and Art

## FIRE! FIRE! FIRE!

## GRIFFITHS' "PYRODENE" FIREPROOFING LIQUID

(NON-POISONOUS).

## Transparent Liquid for Rendering Woodwork Uninflammable,

Without altering its appearance, and where Painting is not desired, such as Wooden Fittings in Exhibitions, Churches, Pews, Matchboarding, Theatre Scenes, Wooden Stairs, Joists, Beams, Floors, Factories, Stables, Mills, &c., in fact, Structures of an inflammable nature of all descriptions. Acts as a priming for new Woodwork for Paint or Varnish. Also for rendering Theatrical and Ball Dresses, Curtains, Paper, Felt, Canvas, &c., perfectly uninflammable.

Griffiths' Liquid penetrates the pores of the wood. It lasts as long as the wood itself. It prevents Dry Rot and decay in house timbers. It does not crack, peel, or rub off.

It is perfectly innocuous and free from smell. It will keep any length of time. Any one can apply it. One gallon will cover double that of any other priming.

AND

All Woodwork in new houses should be fireproofed with this liquid, the cost is so trifling in comparison with the preservation of the timber and freedom from risk of fire. If work is desired to be painted afterwards, Griffiths' Pyrodene Paint is best for the purpose.

## GRIFFITHS' "PYRODENE" FIREPROOF PAINT.

READY FOR USE.

NON-POISONOUS.

ALL COLOURS.

This Paint is manufactured for preservative and decorative purposes equally as for its FIRE-RESISTING qualities. The Fireproof Paint and Fireproofing Liquid is used at some of the principal Theatres in the United Kingdom.

## RECENT TESTIMONIALS.

From Messrs. MAXWELL & TUKE, Architects, 29 Princess Street, Manchester: December 28, 1887.

DEAR SIRS.—We used your Paints in nearly the whole of the works for the Royal Jubilee Exhibition, and with very satisfactory results.

Yours truly, MAXWELL & TUKE.

To Messrs. Griffiths Bros. & Co., Dashwood House, London, E.C.

From S. C. LOWE & SON, House Decorators, 32 Cavendish Street, Stretford Road, All Saints, Manchester: November 22, 1887.

DEAR SIRS.—In reply to your inquiry, we, as one of the contractors for the painting of the Manchester Jubilee Exhibition, which closed on the 10th of this month, have pleasure in stating that both your "Aqual" Paint, and also your "Pyrodene" Fireproof Paint, have given great satisfaction. We found them work easily with a covering power of from 30 to 40 per cent. over ordinary paint. Although applied during intense frost, and having been subjected to an almost tropical summer, followed by the drenching rains of this autumn, they are as fresh in colour and have as firm a grip as when applied, and appear quite unaffected by the nine months' exposure. We consider them, therefore, well adapted for all work in any climate.—Yours truly, S. C. LOWE & SON.

## CHEAPER AND MORE DURABLE THAN ORDINARY PAINT.

GRIFFITHS' "PYRODENE" FIREPROOFING COMPANY, Limited,  
4 & 5 DASHWOOD HOUSE, NEW BROAD STREET, E.C. LONDON.

Department are recommended is that upon the result of those examinations the Whitworth scholarships for mechanical science are awarded. The subjects recommended to be taken up include freehand drawing, practical plane and solid geometry, mechanical drawing, mathematics, theoretical and applied mechanics, sound, light and heat, magnetism and electricity, chemistry, metallurgy, &c. Upon all these subjects valuable hints are given in the syllabus, together with the titles and authors of standard works in relation thereto.

#### THE COX-WALKER-SWINTON MAGNETO-BELL SYSTEM.

ELECTRIC bells and signals have hitherto depended largely for their action on voltaic batteries, and these are notably difficult to maintain in working order, but are always consuming, and therefore constantly incurring, expenditure for replenishment. It is well known what a frequent source of trouble is the ordinary electric-bell battery. It cannot be sent out charged and ready for use, but this must be effected after it reaches its destination. In hot weather it is apt to dry up and refuse to work; in cold weather it freezes with the same result. After a few months' working it must be recharged, and after a year or two it is worn out, and must be renewed entirely. These operations generally require skilled attendance, often difficult to obtain, and thus cause great expense and annoyance. The new magneto-bell system of Mr. E. Cox-Walker and Mr. A. A. Campbell Swinton has been designed to obviate these disadvantages. The electric currents that operate these instruments are generated when required by the motion of a coil of insulated wire between the poles of a permanent magnet. No battery or anything else that consumes away and requires replenishing, or is likely to get out of order, is employed, and the apparatus is thus practically everlasting. The magneto-generator, which takes the place of the push-button and battery used with ordinary electric bells, consists of a single horseshoe permanent magnet made of steel, fitted with soft iron pole-pieces, between which is pivoted an armature composed of a shuttle-shaped soft iron core wound over with insulated copper wire. In connection with this armature is a small brass handle, by means of which the armature is easily turned backwards and forwards through a small arc. There is no gearing or other complications, and the parts mentioned, together with a pair of brass terminal screws in connection with the two ends

of the wire on the armature, and serving for the attachment of the double wire leading to the bell, comprise the whole transmitting apparatus. The generator is simply operated by taking the small handle between the finger and thumb and giving it a rapid to-and-fro motion. This movement generates electric currents in the armature wire by electro-magnetic induction, and these currents pass away through the terminals and double connecting wire to the bell at the other end. Several types of bell are manufactured to suit different requirements. In each there is an electro-magnet, in front of the poles of which is pivoted an armature carrying a hammer, the core of the electro-magnet and armature being kept continually magnetised by means of a small permanent magnet. When the generator is operated the electric currents pass round the wire on the electro-magnets, and, being of varying strength and direction, cause the armature and hammer to vibrate. In some cases two gongs are employed with the head of the hammer placed between them, so that each gong is struck alternately. This produces a pleasant musical effect; but where greater simplicity and compactness are required only one gong is used, this gong having two projecting tongues cast on its rim, and the hammer head being arranged to strike first one tongue and then the other as it vibrates from side to side. They are being introduced by the Equitable Telephone Association, Limited, Queen Victoria Street, E.C.

#### MANCHESTER DRAINAGE SCHEME.

ON Tuesday the manager of the Coventry Sewage Works, established in 1878, Mr. E. F. Coddington, gave evidence before Mr. S. J. Smith, C.E., under the inquiry held as to the application of the Manchester Corporation to borrow 490,000*l.* for the proposed sewage scheme.

Mr. Coddington said he had been manager since the works were opened. He produced plans of the works, filter beds, and of the adjoining district. The sewage was drained through a screen, which took out all the faecal and other floating matter. It then passed through a chamber where it received the sulphate of alumina. In another chamber it received the sulphate of lime. The precipitating tanks next came into use, and then the effluent was passed on to the filter beds and thence into the rivers. The filter beds were eight acres in extent. Four million gallons of sewage could be daily chemi-

TO THE BANK OF ENGLAND AND ITS BRANCHES,

*Including the New Law Courts Branch now in course of Erection.*

### IMPORTANT COMMUNICATION. — WHITELEY'S FIRE.

WILLIAM WHITELEY, Westbourne Grove, London: October 12, 1887.

HOBBS, HART & Co., Limited.

GENTLEMEN,—It affords me very much pleasure to express to you my satisfaction and admiration at the splendid fire-resisting powers of your Strong-room Doors and the Safes.

The recent fire at my establishment, in my opinion, subjected them to the greatest possible test, and through all they proved invulnerable. The contents of both Strong Rooms and Safes were entirely preserved, although the fire was of such intense destructive force.

You will be pleased to hear that it has been decided to adopt your Patent Clutch Rebated Doors for all the party walls in the new buildings now in course of erection.—I am, Gentlemen, faithfully yours,

(Signed) **WILLIAM WHITELEY.**

cally treated and filtered. All over that quantity passed direct into the rivers. The tanks were cleared once in four days. Coventry sewage was very foul and very full of dye. There were also breweries and varnish works in addition to what might be called ordinary sewage. He had had no complaints from the surrounding inhabitants, and the health of the district, so far as he knew, was very good. In 1884 Coventry was threatened by the Corporation of Warwick with an injunction, on the ground that the effluent was not so clear as it ought to be, whereupon the Town Council of Coventry had the matter thoroughly investigated by Professor Tidy, who reported that there was no nuisance whatever, and that the Warwick people had nothing to complain of. Coventry heard nothing more of the matter. Professor Tidy, in making his report, went right through the works and down the river to Warwick, a distance of fourteen miles. He had never had any complaint from Coventry except once, when experiments were made in the growing of watercresses, when certain alterations in the filter beds were desired by the man to whom they were let. The pipes were stopped for three or four days to allow the water to stop on the beds, and the nuisance became intolerable and had to be put a stop to. No further complaint was ever made. The works were devoid of smell, and it was not unpleasant to walk about in them. Coventry was almost entirely a water-closet town. He could not give particulars of the drainage of the outlying districts. A small stream ran through the town, which was comparatively clear, and had a flow of 2,000,000 gallons per twenty-four hours. They had no difficulty in getting rid of their refuse. The farmers took it readily. The system of using lime and alumina in the treatment of sewage was spreading, and was being adopted by other towns. He considered that in providing for double the population they had not made too great provision. Before the farmers were quite satisfied as to the value of the manure made at the works they had a fairly large accumulation of it, he dared say as much as 1,500 tons. There was no nuisance in the removal of the manure. They considered the complaint of the Warwick people serious, but the City Council of Coventry satisfied themselves by the report of Dr. Tidy that they were in no way to blame in the matter. Nothing further was heard from Warwick. That was not in consequence of their paying a little more attention to the sewage after that time. They made no alteration in the treatment, but they made some alteration in the tanks. He considered eight acres amply sufficient for filtration purposes.

## CHURCH DECORATION.

THE chancel of the church of St. Charles Borromeo, at Weybridge, has just been finished with rich decoration and figures in the Italian Gothic style. The east wall is ornamented with angels painted upon a gold ground, each figure having a thurible and censuring towards the tabernacle. The centre of the upper part of the wall has a large circle of cherubs. Within a nebulae border on either side is the sun and moon, with stars, in gold on a light blue ground. The side walls are painted and diapered, the lower part being finished a low tone of light red, with the diaper in darker tint, with the monogram of St. Charles Borromeo in gold. The principal mouldings and parts of the carved work of the large stone canopy over the altar have been gilded. "Altare Privilegium pro Defunctis" is the inscription over the tabernacle. The lady chapel has also been elaborately decorated in blue, white, and gold. A conspicuous feature are large standards of lilies painted *à la naturelle*. Messrs. Pitman & Son, of Newgate Street, London, have designed and executed the work.

## ARTISANS' DWELLINGS IN GLASGOW.

AT the meeting of the Glasgow Town Council last week it was reported that the special sub-committee on the Saltmarket tenements had submitted to the general committee the following memorandum, prepared by Mr. Carrick, as to the property recently erected by the City Improvement Trustees on the east side of Saltmarket:—The property being now completely finished and fully let, the following details are submitted for the information of the trustees:—The property consists of five tenements, four storeys in height; four fronting Saltmarket and one having its entire elevation towards Steel Street. The street floor fronting Saltmarket is occupied as single and double shops, the three upper floors being constructed for dwelling-houses of one and two apartments suitable for the artisan class of the population. In the whole property there are 12 shops and 48 houses. The cost of the undertaking was originally estimated at 9,000*l.*, with a prospective rental of 1,100*l.* The plans on which this estimate was based were, however, considerably modified by the committee, who directed various amendments to be made, giving increased sanitary advantages and limiting the rental. The actual cost of the buildings is reported by the

measurer as 9,723l. 13s. 9d., the reasons for the increased amount being found principally in the extra masonwork done under the instructions of the committee. The gross rental, amounting to 895l., has been easily obtained, and, so far as I can judge, will, in all likelihood, be improved, as there is every reasonable ground to expect that the value of the shops will increase. The extent of the site as presently enclosed is 1,500 square yards, and the present rental, after deducting 25 per cent. and allowing interest on the cost of the buildings at 3½ per cent., will leave a surplus sufficient to cover a ground rent of 4l. 14s. 4d. per square yard. The committee resolved to report the foregoing memorandum to the trustees for their information, and agreed to consider at next meeting the advisability of recommending the trustees to proceed with the erection of further buildings on the east side of the Saltmarket. The minutes also contained the following:—"There was submitted the abstract statement of the revenue and expenditure of the trust for the year May 31, 1887, to May 31, 1888, which had previously been circulated among the members of this committee. The committee having considered the same, approved thereof, and resolved to recommend the trustees to continue the assessment of 1d. per 1l. for the next year."

Mr. Dunlop referred to the various minutes submitted to the trustees. With regard to Mr. Carrick's report on the Saltmarket houses, he said the committee were not anxious to precipitate any question arising out of the report by asking for powers to finish this block of buildings. The committee chose rather to put before the trustees the financial facts as presented by Mr. Carrick, leaving them to say what course should be pursued in the future. It was very satisfactory to find that Mr. Carrick's estimates for building had only been exceeded by a few hundred pounds, and that was entirely occasioned by difficulties that had arisen and could not be foreseen in connection with the ground. He had received that morning from the factor of the trust a letter showing that the property was fully let, and that the rents due on August 1 were all promptly paid, many of them before they were due. Indeed, some of the tenants called at the factor's office and paid till November, without having been asked to do so. He had had several applications for shops and houses in the proposed additional tenements, and he had no doubt that if erected they would be readily let to good tenants. Mr. Dunlop went on to say there was one feature he should like to draw the attention, not merely of the council, but of the general public to, and it was this. When the plans were laid before the committee his lordship

very properly suggested that the accommodation should be somewhat typical of what the citizens required in such a place, and the single room, which was considered by many to be a thing that should be entirely obliterated, should be retained. It had been retained, and with such a successful result that it would be worth while for those parties who were agitating regarding this question to inspect those single rooms and see what comfort had been provided in them. The like of those one-apartment houses there was not in the kingdom. They had not merely a scullery, but all the privacy of a bedroom attached.

The minutes were confirmed.

#### REGISTRATION OF PLUMBERS.

A PRESENTATION of certificates took place in the Town Hall, Dundee, on Saturday afternoon. Mr. John J. Henderson, C.E., presided, accompanied by Mr. W. Farquharson, secretary to district council. The Chairman, after referring to the spread of the movement, said that probably no artisan holds the keys of disease in his grasp so completely as the plumber, who by good workmanship may exclude forces inimical to health, or by his incompetency may give entrance to malign influences that inflict suffering, and even death, upon their victims. He hoped the classes about to be started through the district council would gradually tend to establish a high order of proficiency in the craft. Eight certificates were then presented, which, along with those presented last week in Fife and Perth, make eighteen for this month.

The first meeting of the Liverpool district council was held last week, Mr. J. B. Smith, chairman of the Liverpool Health Committee, in the chair, and among the gentlemen on the platform were Dr. Stopford Taylor (medical officer of health of Liverpool), Dr. Sprakeling (medical officer of health of Bootle), and Dr. Carter (president of the Liverpool Medical Institution). There was a large attendance of representative master and operative plumbers. Messages of apology for non-attendance and promises of cordial support were received from the mayors of Liverpool, Bootle, and Birkenhead; Drs. Vacher and Steeves, medical officers for Birkenhead and Toxteth Park; the town clerk of Crewe, Mr. E. Jones (diocesan surveyor, Wrexham); Councillor Duncan, Mr. H. Duckworth (president of the School of Science); and the Preston Lodge of Operative Plumbers. It was decided, on the motion of Dr. Taylor,

seconded by Mr. W. Merrick, that the council should be designated the "District Council for West Lancashire, Cheshire, and North Wales." The rules of the Plumbers' Company having been adopted, the following were appointed the registration committee:—Master plumbers: Messrs. G. Ewing, T. Holt, F. Bage, and S. R. Henshaw. Operative plumbers: Messrs. T. Anderson, J. Hoos, J. Duckers, and W. Scot. Public representatives: Dr. S. Taylor, Dr. Vacher, Dr. Sprakeling, and Mr. H. Duckworth. A board of examiners was appointed as follows:—(1) Master plumbers: Messrs. D. Lloyd, J. Powell, W. Male, W. Merrick, and A. C. Wilby. (2) Operative plumbers: Messrs. C. H. Milne, M. J. Heighley, J. Robinson, D. Levy, and D. Foulkes. Public representatives: Dr. Carter, Dr. Steeves, and Mr. E. Kirby, president of the Architectural Society. Mr. Watkin Hall, C.E., surveyor to the Great Crosby Local Board, was appointed secretary, and Councillor Duncan treasurer of the council.

#### ALEXANDRA PALACE.

THE thousands of delighted visitors to the Alexandra Palace during the present summer who have witnessed that striking production of Messrs. James Pain & Sons, "The Last Days of Pompeii," will be glad to learn that the Palace Company have given Messrs. Pain & Sons a benefit, which took place on Thursday, the 20th inst. Pompeii and Baldwin have been the only things worth seeing in this, as a usual rule, badly managed Palace. If the company could make their Palace a little attractive on other nights as well, there would be no reason why the Alexandra Palace should not rank among the popular London places of amusement, and instead of being, as now, fairly well filled only on occasions when fireworks or Professor Baldwin are the order of the entertainment, and then on other nights comparatively empty, visitors would be conspicuous by their presence rather than by their absence. The reputation of Mr. Pain and his sons has always been high, but it is considerably enhanced by Pompeii, which has unquestionably hit public taste. The island in the centre of the great lake was admirably suited to such a production, and the numerous boats rowing about the lake adds to the effect of the picture seen from the land. The programme issued for Thursday ran as follows:—"There will be a magnificent round of entertainments at the Palace for the amusement of the tens of thousands who will flock to it. The King of Cloudlands will make one of his

fearless ascents and leaps; all the specialties in the building will be in full swing. There will be two variety performances on the new stage of the central hall, the circus combination in the new arena will give two performances, Mr. J. Valentine Smith will give an English opera, probably "Maritana," in the theatre, and then will come off that marvellous production which will be the special object of interest of all who attend on this occasion. After the unequalled representation of Pompeii in its glory, and the incidents preceding its destruction, Vesuvius will be more terrible in its eruptions than ever; and after the city is destroyed there will be an unequalled display of fireworks, eclipsing all previous productions."

#### UTILISATION OF ELECTRICITY.

(Concluded.)

THE property which the electric current possesses of doing work upon the chemical constitution of bodies so as to break up certain liquid compounds into their constituent parts, and marshal these disunited molecules in regular order according to a definite law upon the surfaces of metals in contact with the liquid where the current enters and exists, has led to immense industries in electro-metallurgy and electro-plating. The extent of this industry may be gathered from the fact that there are 172 electro-platers in Sheffield and 99 in Birmingham. The term electro-metallurgy was originally applied to the electro-deposition of a thin layer of one metal on another; but this is now known as electro-plating. In 1839 Jacobi in St. Petersburg and Spencer in Liverpool laid the foundations of all we know of these interesting arts. Copper was deposited by them so as to obtain exact reproductions of coins, medals, and engraved plates. The first patents in this country and in France were taken out by Messrs. Elkington, of Birmingham, who still occupy the foremost position in the country. The fine metals, gold and silver, are deposited in thin layers on coarser metals, such as German silver, in immense quantities. Christofle, of Paris, deposits annually six tons of silver upon articles of use and of art, and if the surfaces so electro-plated were spread out continuously they would cover 140 acres. The whole of the copper plates used in Southampton for the production of our splendid Ordnance Survey maps are deposited by current on matrices taken from the original engraved plates, which are thus never injured or worn, are always ready for addition or

correction, while the copies may be multiplied at pleasure and renewed at will. Nickel-plating, by which the readily oxidisable metals like iron are coated with a thin layer of the more durable material nickel, is becoming a great industry; the trappings of harness, the exposed parts of machinery, the fittings of cycles and carriages, and innumerable articles of daily use are being rendered not only more durable, but more beautiful. The electro-deposition of iron, as devised by Jacobi and Klein, in the hands of Professor Roberts-Austen, F.R.S., is giving very interesting results. The dies for the coins which were struck at our Mint on the occasion of the jubilee of the Queen were modelled in plaster, reproduced in intaglio by the electro-deposition of copper, and on these copper moulds hard excellent iron in layers of nearly one-tenth of an inch was deposited.

The exact processes of measurement which have led to such vast improvement in our telegraphic systems have scarcely yet penetrated into this field of electrical industry, and little is known at present of the exact relations of current and electro-motive force with respect to surfaces of contact, rate of deposit, and resistance of liquids. Captain Sankey, R.E., of the Ordnance Survey Department, has done some useful work in this direction. The extraction of metals from their ores by deposition has received wide application in the case of copper. In 1871 Elkington proposed to precipitate copper electrolytically from the fused sulphide of copper and iron known to the copper-smelter as regulus. Thin copper plates were arranged to receive the deposited copper while the foreign metals, including gold and silver, fell to the bottom of the solution, the process being specially applicable, it was supposed, to regulus containing small quantities of the precious metals. The electrical purification of copper from impure "blister copper" or "blade copper" has also made great progress, and special dynamos are now made which will, with an expenditure of 100 horse-power, precipitate 18 tons of copper per week. The impure metal is made to form the anode in a bath of sulphate of copper, the metal being deposited in the pure form on a thin copper cathode. It was not very long ago considered very economical to absorb 85 horse-power in depositing one pound of copper per hour, but now the same work can be done with 3 horse-power. Mr. Parker, of Wolverhampton, has done good work in this direction, and his dynamos in Messrs. Bolton's works have revolutionised this process of purification. Both at Swansea and Widnes immense quantities of copper, in spite of the restrictive operations of the copper syndicate, are being produced

by electro-deposition. Copper steam pipes for boilers are now being built up of great firmness, fine texture, and considerable strength by Mr. Elmore, at Cockermouth, by electro-deposition on a rotating mandrel in a tank of sulphate of copper. By this process one ton of copper requires only a little more than one ton of coal to raise the requisite steam to complete the operation. It has been shown that the electrolytic separation of silver from gold by similar methods is perfectly practicable. Although the old acid process of "parting" gold and silver remains practically undisturbed, there seems no reason to doubt that in the future electricity will render us good service in this direction as it has already in the purification of copper.

It is well known that the late Sir W. Siemens considered that the electric arc might render good service in the fusion of metals with high melting-points, and he actually succeeded in melting 96 ounces of platinum in ten minutes with his electrical furnace. The experiments were interrupted by his untimely death, but in the hands of Messrs. Cowles the electric arc produced by 5,000 ampères and 500 horse-power is being employed on a very large scale for the isolation of aluminium (from corundum), which is immediately alloyed (*in situ*) with copper or iron, in the presence of which it is separated. The heating power of large currents has been used by Elihu Thomson in the United States, and by Bernardos in Russia, to weld metals, and it is said to weld steel without affecting its hardness. It has even been proposed to weld together in one continuous metallic mass the rails of our railways so as to dispense entirely with joints. It is almost impossible to enumerate the various general purposes to which electricity is applied to minister to our wants and to add to our comforts. Every one appreciates the silent efficiency of the trembling electric bell, while all will sooner or later derive comfort from the perennially self-winding electric clock. Correct mean time is distributed throughout the length and breadth of the land by currents derived from Greenwich Observatory. Warehouses and shops are fitted with automatic contact pieces, which, on any undue increase of temperature due to fire, create an alarm in the nearest fire-station; and at the corner of most streets a post is found with a face of glass, which on being broken enables the passer-by or the watchful and active policeman to call a fire-engine to the exact spot of danger. Our sewers are likely to find in its active chemical agency a power to neutralise offensive gases, and to purify poisonous and dangerous fluids. The fact that the energy of a current of electricity, either

when it flashes across an air-space or when it is forced through high resistance, assumes the form of heat of very high temperature led early to its employment for firing charges of gunpowder; and for many civil, military, and naval purposes it has become an invaluable and essential agent. Wrecks like that of the *Royal George* at Spithead were blown up and destroyed; the faces of cliffs and quarries are thrown down; the galleries of mines and tunnels are excavated; obstructions to navigation like the famous Hell Gate, near New York, have been removed; time-guns to distribute correct time are fired by currents from Greenwich at 1 P.M. In the operations of war, both for attack and defence, submarine mining has become the most important branch of the profession of a soldier and a sailor. Big guns, whether singly or in broadside, are fired, and torpedoes, when an enemy's ship unwittingly is placed over them, are exploded by currents of electricity. An immense amount of research has been devoted to design the best form of fuse, and the best form of generator of electricity to use to explode them. Gun-tubes for firing consist of a short piece of very fine wire, embedded in some easily fusible compound, while the best form of fuse is that known as the Abel fuse, which is composed of a small, compact mass of copper phosphide, copper sulphide, and potassium chlorate. The practice in the use of generators is very various. Some, like the Austrians, lean to the high tension effects of static electricity; others prefer magneto machines; others use the dynamo; while we in England cling with much fondness to the trustworthy battery. Since the electric light has also become such a valuable adjunct to war purposes, it is probable that secondary batteries will become of immense service. The strong inductive effects of atmospheric electricity are a source of great danger. Many accidental explosions of fuses have occurred. An experimental cable with a fuse at one end was laid below low-water mark along the banks of the Thames at Woolwich. The fuse was exploded during a heavy thunderstorm. The knowledge of the causes of a danger is a sure means for the production of its removal, or of its reduction to a minimum. Low tension fuses and metallic circuits reduce the evils of lightning, but have not removed them. Should war unhappily break out again in Europe, submarine mining will play a very serious part, and, paradoxical as it may appear—as has been suggested by the French ambassador, M. Waddington—its very destructiveness may ultimately prove it to be a powerful element of peace.

Electric lighting in America was described by Professor

George Forbes. He spoke of the Westinghouse installations, and the advancement made by him in developing the high tension currents and transformed system of Messrs. Gaulard & Gibbs, which was first practically tried on the London Metropolitan railways some few years ago. Whereas in England we were still only talking of attaching electric lighting plant to houses, in the States the orders to the manufactories were coming in for town stations. The chief progress had been in America in three directions—arc-lighting, incandescent lamps with the three-wire system, and incandescent lamps run with converters—the latter an extension of the Gaulard-Gibbs system, which, in the States, has attained to the daily lighting of about 300,000 lamps. It was not, in the Professor's opinion, that the American machines and plant were better than those produced in this country—on the contrary. But the Americans had set to work in a different business way. They had taken a type of sufficiently good, not the best, machine, and had turned it out by machinery in three definite sizes. All the parts were made to the same pattern, each set by its own tools. Cheapness was thus effected, and if the customer required a new part to replace any breakage or defect, he had only to write or telephone its number to get one that would fit supplied. It was in this way business had been largely done, whilst in this country almost every machine produced was designed for some special duty. In America, too, there was no legal interference in the path of electricians, like the Act which had so long obstructed the way, and from which little or no tangible relief had been afforded by the amendment passed in the last session of Parliament. In the American adoption of the converted system, these high currents were limited to 1,050 volts, and the reductions brought the delivery currents into the houses to 50 volts. In this country the tendency was to deal with currents of 2,000 volts, and to reduce them to 100 volts at the lamps. The American electricians regarded the lower voltage as better for the longer endurance of the incandescent lamps. In England there was a disposition to advocate large engines, of the marine type; but in America a number of small engines were employed, for the reason that they could be put on as required and worked at their full load; and that in high tension currents the accident most likely to happen to the mains was short circuiting, by the contact of some broken telegraph or telephone wire, the electric light conductors being naked, and carried on street poles or over the housetops. The distribution was divided as much as possible, and as worked by a number of machines, the current, in case of accident, is not likely to be

brought back in dangerous quantity, but the damage was absorbed by the whole group, or localised upon one item of it. In the American lighting-stations the machinery was run night and day, and the Professor thought too much trouble had been made about continuous running. The great ocean steamers worked their engines incessantly for days and even weeks together, and smaller engines ought to be more able to work for still longer periods without any fear of a breakdown. In Pennsylvania the natural gas was used for the steam-engines. It was very free from carbon, and when a high amount of heat was got from its combustion, on the principle of the Bunsen burner, the results were very satisfactory, and it could be automatically regulated, so that attendance could be very considerably diminished.

## PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Cassell, Consulting Patent Agents, 43 Southampton Buildings, Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

## APPLICATIONS FOR PATENTS.

12924. John Bradshaw, for "A chimney-pot or top." September 7, 1888.  
 12946. Timothy Line and James Daveney, for "An improved method or mode of manufacturing or fixing wooden wainscots and ceilings or other purposes to be named, and known as 'Poikiloculan.'" September 7, 1888.  
 12955. Alfred Julius Boulton, for "Improved closing devices for keyholes and locks." (Friedrich Eiche, Germany.) September 7, 1888.  
 12957. Thomas Sidney Shouler, for "Improvements in or relating to springs and checks for doors and the like." September 7, 1888.  
 12995. Robert Parry, for "Improvements in apparatus for cutting or dividing the length of clay emitted from brick or like machines." September 8, 1888.  
 13009. Richard Holdsworth and Herbert Garland, for "Improvements in door and other bolt locks." September 8, 1888.  
 13020. Arthur Everton, for "Improvements in bolts or fastenings to be used for securing doors, drawers, and for other purposes." September 8, 1888.

13030. Francis Fryer Abbey, for "A machine or apparatus for regulating the ventilation of main drains, conduits, and sewers, and all the connections attached to or communicating therewith." September 10, 1888.

13040. Hugh McKibbin, for "A novel arrangement of window-frames, sashes, and the fasteners therefor." September 10, 1888.

13049. Frederick Dolian, for "Improvements in dividers and compasses made of sheet metal." (Frederick Motz, United States.) September 10, 1888.

13155. William Joynson, for "Improvements in and connected with roof gutters." September 12, 1888.

13158. John Lawson, for "Improvements in apparatus for heating buildings and other purposes by combination of air and water." September 12, 1888.

15666. George Moffatt Rhys Layton, for "Improvements in the manufacture of cement." November 15, 1887.

17556. Harry Stockman, for "Improvements in ventilators." December 21, 1887.

17967. Benjamin Gregory, for "Improvements in the manufacture of blue bricks, tiles, fire bricks, and the like." December 31, 1887.

19591. Edward Thorp, for "Wind and water bars for meeting rails, top and bottom rails, of sliding sashes; top rail and stiles for casement sashes; top rail and stiles of doors." July 2, 1888.

#### PATENTS SEALED, SEPTEMBER 14, 1888.

9269. Joseph Pratt, for "Improvements in constructing horticultural and other buildings." June 30, 1887.

11957. James Frederick Wiltshaw, for "Improvements in the mounts of door and other knobs." September 3, 1887.

11961. Benjamin Turner, for "Improvements in door-springs." September 3, 1887.

1715. Alfred William Mitchell, for "An improved device or appliance for securing slate to roofs." February 4, 1888.

7670. John Harrison, for "An improved machine for sawing stone." May 25, 1888.

#### ABRIDGMENTS.

"Improvements in exit ventilators for rooms and other places where down draughts are to be avoided, &c." No. 14431. 1887. J. W. Gibbs, 4 South John Street, Liverpool.

*Claim 1.*—An exit ventilator for rooms or the like, consisting of a suitable framework of papier-mâché or similar composition, and of one or more flaps or valves, and composed of asbestos, card, or mill-board, or of similar soft non-inflammable material, substantially as and for the purposes described.

"Lock bricks." No. 7815. 1888. J. L. Champion, Newquay, Cornwall. An ingenious invention, consisting of an ordinary brick, having a dovetailed shaped opening in on one side, whereby the said brick is locked to another similar brick, placed parallel with the same by means of a cross brick or tie, made to fit into the said dovetail openings at each end.

*Claim 1.*—The making of those especially designed bricks for locking together, as herein described and shown.

"Improvements in the utilisation of slate, slate waste, black grit, &c., in the manufacture of glass and other articles." No. 8129. 1888. W. J. Parry, Coetmor Hall, Bethesda, Bangor; and Mr. J. T. Welch, 32 Penhryn, Bethesda. This useful invention is principally for using up materials at present wasted, for the manufacture of glass and such like substances, which can thus be produced at a very low price.

*Claim 1.*—The utilisation of waste or refuse slate and black grit, or other like waste material, by grinding, pulverising, or disintegrating the same, and then firing the same, substantially as herein described, and for the purpose or purposes stated.

TO INVENTORS.—Patents for Inventions, Trade-marks, and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CASSELL, Patent Agents, 43 Southampton Buildings, Chancery Lane.

# The Architect.

## THE WEEK.

THE first autumn exhibition of pictures, which was opened in the Municipal Art Gallery of Wolverhampton on Monday last, contains between five and six hundred works. The loan collection is of importance, and includes Mr. ORCHARDSON'S picture representing VOLTAIRE relating the insult offered to him when he was horsewhipped for a lampoon; Mr. MADOX BROWN'S *Work*, which has happily found a resting-place in the Manchester Art Gallery; Mr. HENRY MOORE'S *Moun's Bay*; Sir EDWIN LANDSEER'S *Chantrey's Studio*, which is a portrait of the sculptor's favourite dog; Mr. JOHN FAED'S *Sculptor's Dream*. There is a picture by GUSTAVE DORÉ of a group of poverty-stricken women, which will not sustain the reputation of the painter. Local art is well represented. It is proposed to open the exhibition to the public on several days without payment.

M. ANTONIN PROUST has, on behalf of the special committee, sent a report to the French Minister of Fine Arts upon the arrangements of the art section in next year's International Exhibition. It is proposed to have six divisions of the section. The first relates to French art belonging to the period between 1789 and 1878. The second division will be international, and comprise works which were produced between 1878 and 1889. In the third division, which will be found in the Trocadéro, monumental art will hold sway, including casts, designs, photographs, &c. A division will be assigned to works which will exemplify instruction in art. The space under the cupola of the galleries of industry will be appropriated by the fifth division, which will be one of the most interesting, as it will represent the work produced in national manufactories—Gobelins, Sèvres, &c.—during the century. Finally, as becomes a French exhibition, the theatre will have its division, in which the construction of theatres, stage machinery, costumes, decorations, &c., will be shown by models and examples.

THE classes for the study of architecture at University College, London, will as usual be opened by Professor ROGER SMITH with a public lecture, the subject of which is announced to be "Mistakes in Architecture." This will be delivered at the college on Thursday evening, October 4, at 7.30 P.M.

THE sudden death of M. GUSTAVE BOULANGER will be regretted by many people, and among them will be the English students in his *atelier*, for whose progress he was most zealous. He was simple in his way of life. M. BOULANGER lived alone in a very small house, and, when he desired to see a doctor, he had to call an attendant from an adjoining house. Unfortunately aid came too late. He had attained the highest honours which an artist can expect in France—a seat in the Institut, a professorship in the Ecole des Beaux-Arts, and the Legion of Honour. M. BOULANGER could hardly fail to be considered as a representative of Academicism, but although he painted subjects which, from their titles, might be supposed to belong to that form of art, no one could have less of the mannerism which is ascribed to Academic painters. He began his career with JOLLIVET, who believed in a pupilage of fifteen years. The danger which might arise from so long a term of plodding over exercises was obviated by a voyage to Algiers. When he returned he had gained new ideas about colour and light. Art became more of a pleasure to him, and in 1849 he was able to carry away the Prix de Rome. His paintings fall into two classes—ancient Roman scenes and African scenes. Most of the pictures which he sent to the Salon during thirty years are known by engravings. Among his public commissions may be named the paintings in the Foyer de la Danse of the Paris Opéra House, and the large work in a Mairie which was illustrated in *The Architect*. In the latter work he introduced portraits of several artists. As the head of one of the great *ateliers*, M. BOULANGER was able to exert influence over the younger artists. Every work was rigorously examined, and many a study became valuable by his emendations. If a

student undertook a painting, he was sure of M. BOULANGER'S advice, no matter how many flights of stairs had to be mounted for that purpose. Indeed, it may be said that his efforts to raise the character of his school helped to shorten the painter's life. M. BOULANGER was the husband of Mdlle. NATHALIE, of the Théâtre Français, who died some years ago.

THE re-erection of the chancel of the great church of Cromer, which was blown up by a clergyman of puritanic tendencies because it was supposed to interfere with his way of conducting a service, is now almost complete. The work has been executed with extreme care by Mr. THOMPSON, of Peterborough, and the details correspond with those of the nave. The chancel arch is boarded, and the plain boards, although rather surprising at first sight, may be said to be in keeping with the gauntness of the remainder of the church. The restoration being expensive, and as the congregation varies greatly in number, various modes of raising funds have been adopted. One of the most ingenious is the distributing of tickets of admission to Mrs. BOND CABELL'S park, for which a sum is charged. Cromer is increasing in size, and now contains many large houses of red brick, which are prudently erected at some distance from the shore, and in course of time there ought to be little difficulty in discharging all debts on the church fabric.

AN honorary correspondent of the Society for the Preservation of Ancient Buildings writes:—"The following is extracted *verbatim et litteratim* from the September issue of the *Ormskirk Parish Church Magazine*:—"The parishioners will be glad to know the destination of the old oak benches. They are being sent to a school of art in Boston, U.S.A. A gentleman has bought them for the purpose, and the vicar and wardens have received the sum of 80*l.* for them, which amount is lodged in the bank to the credit of the restoration fund. We retain a few of the old seats in the church." A correspondent of the *Manchester Guardian* says in reply:—"As regards the merits of the restoration question, treated as a whole, I have not a word to say. I know that some archaeologists prefer to see a building become dangerous, or indeed come tumbling down, rather than that any rude hand should stay or prevent the process. But the head and front of our offending is those unlucky benches. I have sat on those seats, and have tried, as a good churchman should, to kneel between one seat and another as they were 'archæologically' placed. And if you, sir, had had the same experience, you would have eloquently written that they were magnificently absurd seats, totally unfitted for their purpose, productive of excruciating discomfort, not to say pain, and actually the worst attempt at a comfortable church sitting that our unfortunate century has witnessed." As we said last week, the public in many cases are suspicious that archaeologists prefer to leave buildings to tumble down.

THE strike of the riveters employed on the Eiffel Tower having come to an end, and the work of erection being resumed, the committee of taste associated with the International Exhibition have discussed the question of how the mighty combination of lattice girders should be coloured. In the end it was decided that a reddish-brown would be the most effective colour. It would be a tedious process to emphasise the details of the tower, and as the greater part is made up of bars divided by open spaces, a single colour is not likely to appear heavy. Red will also look well when seen against the clear sky of Paris, and lastly, it will help to distinguish the tower from all the builders' work in the district.

THE *Inland Architect* of Chicago records the collapse, on the 22nd ult., of the lofty tower and spire of the new church of the Covenant, Washington. It, so it is stated, "collapsed and sank in ruins without apparent cause except inherent inability to stand up any longer." The disintegrated tower telescoped completely. The architect, Mr. J. C. CADY, who should be able to judge, says that the weight of the upper part of the tower, which was in all 138 feet high, rested chiefly on three piers between the entrance arches of the first storey, and that these were amply strong to support ten times the load; he considers that quicksand below the footings may explain the failure.

## MUSEUMS AND ART GALLERIES.\*

THE old-fashioned museum might have been suggested by ROMEO's description of the Mantuan apothecary's shop, for it was in part made up of tortoises, stuffed alligators, and skins of ill-shaped fishes. Anything which came from some distant land, anything which seemed to be a freak of nature, was a welcome addition in such places. The museum was, in fact, a receptacle for whatever was uncommon from earth, sea, or sky. Indeed, one of the characteristics of the predecessor of the modern archæologist was his fondness for the curiosities of natural history. According to the description of him, "his chamber is commonly hung with strange beasts' skins, and is a kind of charnel-house of bones extraordinary." There is still use for a collection of odds and ends which relate to nature and antiquity, but it is no longer desirable that a museum should be a place which can only serve to amaze the rustic sightseer.

But when we come to ask what better principle should be adopted for constituting museums, it is not easy to find an answer. It is well to have a storehouse for things made by man's hand which have contrived to survive from a past age; and, on the other side, a student of natural history will prefer a collection of old bones before the best examples of Mediæval metalwork. Is it possible to satisfy the desires of all classes of students, especially when there are no means of purchasing objects except chance contributions? Then, again, there is a supposition that a museum should be an aid to trade by containing examples from which a designer and workman could learn something. Can a museum of antiquities and natural history be also made to subserve that end? If we take the book lately issued by Mr. GREENWOOD as a guide, we find that the uses of a museum are expected to be still more varied in character. According to him a museum should "provide rational amusement of an elevating character to the ordinary visitor," in addition to "providing a home for examples of local objects of interest of an antiquarian, geological, or other character," and "specimens of manufactures resembling those produced in the immediate locality."

No doubt it would be practicable to form museums of that kind, just as in literature it is possible to prepare an encyclopædia. But as no one who cares to master a subject would trust to the most voluminous work of the encyclopædic class, preferring to obtain special treatises, so it may be said that most of the museums which are supposed to be comprehensive, but must be incomplete in every department, will always be unsatisfactory to anyone who desires more than a slight gratification of his curiosity. We cannot expect many museums of the British Museum and South Kensington types, and any attempt to imitate them on a small scale is little more than a waste of labour. With limited means we cannot expect too much, and provincial towns would, therefore, do well to consider whether greater utility is not derivable from a museum with a definite and restricted purpose than from one which will be more suggestive of the things which are absent than of those which were in view.

The fact is, that when a miscellaneous collection is once set up in a county town, it is almost impossible to exclude rubbish. A curator is always troubled with the sight of his empty cases, which are supposed to be a slur upon him, and he will accept anything for the moment. But what is the use of looking at such objects as "the clogs worn by the poet SOUTHEY"? and in most museums we see still more startling examples. Can we imagine that they will do much for the education of the people?

Mr. RUSKIN is supposed to be a visionary, and at times he has written as if he were possessed of more than human power; but among his numerous good deeds was the setting up of a museum which might serve as a model for local authorities who are willing to expend a part of the rates on museums. The house in Walkley where Mr. RUSKIN's treasures are stored is too small to accommodate more than a few students at a time, and it is too remote from Sheffield to allow of a visit on a wet day. But the jewels within compensate for the defects of the casket.

Unlike most museums, there is nothing at Walkley which is suggestive of rubbish. As becomes a son of Oxford, Mr. RUSKIN is strong in logic, and what is seen serves to prove that the world is full of beauty in form and colour, and that in past ages the workmen brought themselves into relation with nature by trying to make their work beautiful. It is essentially a museum for producers, and a day spent there would be more profitable for an operative than a year's wandering through miscellaneous collections. Mr. RUSKIN did not seek to instruct mineralogists or ornithologists when bestowing his minerals and drawings of birds, although men of those classes might learn a good deal at Walkley, his aim being "to show the influence of the character of the workman upon the arts, and to indicate the circumstances which produce the finest art, and thus the finest men and women." There is a unity, therefore, in the collection, which must be a surprise to a visitor who has had experience of ordinary museums. In every museum a similar principle should be adopted, and in proportion to the extent in which unity prevails, will be the success of the collections.

Another museum which is also useful, although most limited in character, is one in Norwich. It receives, however, scant notice in Mr. GREENWOOD's book. In the Norwich Museum ornithology is predominant, and until recently that department could vie with what was to be seen in the British Museum. Students of natural history will also find much else that is interesting, and there is besides a fine collection of antiquities of the county. Admission to the museum is readily given, but all the expense is borne by subscribers. Most of the contents were furnished by the GURNEY family, who are omnipotent in Norfolk. It is not a trade museum, nor intended to aid designers; but, within the limits laid down by the founders, the Norwich Museum is most satisfactory. It suggests what can be done when a few men have a definite purpose in view; and, should the offer of Mr. GURNEY be accepted, and the old prison of Norwich Castle be converted into a museum at his expense, it is to be hoped that the control will still be retained by a committee who have done so much good work.

As yet England is without commercial museums; but in those which we have seen abroad there is a definiteness which should be imitated in this country. The contents are systematically arranged, and there is nothing introduced which can divert attention from manufactures and commerce. A foreigner can see what is obtainable in the district represented by the museum, and in most cases that is of more importance to him than any specimens of ancient manufacture.

England, which is the land of specialists, suffers in respect to museums from the influence of men who cannot claim to be masters of any one department of knowledge. Look, for instance, at the stuff which for years has represented English building and engineering at South Kensington. A hodman could hardly go through the galleries without laughing; but what did HENRY COLE and the other officials of the Department know about construction? They acted according to their lights, which were dim enough, and as long as we leave the control of museums to men of their caste, we must expect similar fiascos. In the British Museum, most of the departments are controlled by chiefs who can claim to be specialists; but we cannot suppose that the museums in country towns will ever be so fortunate. Each will have a single curator at the most, and his qualifications must necessarily be limited.

There is at the present time a strong desire to establish museums throughout the country; but care must be taken in establishing them to do nothing that will cause disappointment. It will be vain to open them if they are expected to combine "rational amusement," archæology, and commerce. Our time is one of struggle, and if museums can aid us in producing better goods than our foreign rivals, let them be set up in every manufacturing district. But there is no use in treating affairs of business as if they were of no more concern to us than archæology, as will appear to be done if past and present are divided by no more than thin partitions. Industrialism is a serious affair, and we shall not be gainers if we turn it into "rational amusement," or make it a subject for speculation and talk, which is all the majority of archæologists attempt. We are far

\* *Museums and Art Galleries.* By Thomas Greenwood, F.R.G.S. Simpkin, Marshall & Co.

from denying the advantages or the interest of archæology, but what most people seek when they think of opening a museum in a town is not an extension of their knowledge of ancient ways. Let archæological museums be formed in every county of England; but what we now most need are industrial museums, which will have as close a relation as possible to the manufactures of the neighbourhood.

As we glance over the descriptions of museums in Mr. GREENWOOD's book we find that there are towns which frankly accept the conditions of the problem which is before us. Birmingham has not only a free library, which is endowed with the most expensive technical books, and a catalogue which, so far as it goes, is a guide to the student, but it has a collection of examples of metalwork, glass, pottery, and textiles which is invaluable. The gifts are already worth about 50,000*l.*, and as the utility of the art gallery is manifested they are sure to be largely increased. Manchester has as yet no industrial museum that can be considered as worthy of so great a city, but, thanks to the Whitworth Trustees, the deficiency will soon be supplied. Salford has a museum, but industrialism is not sufficiently represented in it. In all towns of the kind there is a reliance on the South Kensington Loan Collection to make up the deficiencies of the museum, and indeed some curators believe that continual change is necessary in all museums—a statement which suggests that amusement is supposed to be the first desideratum of a collection. Hence the importance which a piece of carved wood in the Northampton Museum assumes in the eyes of visitors. It is said to have occupied the amateur 5,941 hours, and the sacrifice of so much time is supposed to be heroic, although the result is worthless. A piece by GRINLING GIBBONS, or by one of the Sienese carvers, if placed beside the product of so many wasted hours, would probably be passed over. Yet philanthropists still persist in maintaining that the interests of the better classes of the community should be sacrificed to give amusement by means of amorphous objects. We grant that something must be sacrificed for the purpose of attracting visitors to a museum. But the success of the promoters of the Manchester Art Museum shows how much can be done by earnest men when they try to reveal the importance of what is good to the ignorant. An engraving in that way is found to have as much interest as a stuffed sparrow with four legs.

So long as museums have to serve a variety of purposes it is difficult for curators to determine the dispositions of rooms, and hence architects are often obliged to depend on suggestions which are afterwards found to be inadequate. At present, in the majority of English museums, natural history absorbs most of the space, and arrangements for the display of stuffed birds or fishes and fossils will not necessarily serve for all industrial products. There may need to be variations in the lighting, the height and form of the rooms. But curators consider a museum building should be elastic, and have little hesitation in transferring their collections from one part to another without much regard for light or space. There is often, in consequence, much grumbling, of which the architect is the victim. We do not believe that the country gains much by the devotion of museums to natural history, and we should prefer to see the establishment of independent buildings for industrial examples rather than the setting apart of a room or two for that purpose in the neighbourhood of the department of fossils. No matter what curators may say, a museum cannot by any contrivance become all things to all men; and as there had to be a separation in Bloomsbury a similar revolution should take place elsewhere.

Mr. GREENWOOD's sympathies are with naturalists rather than with manufacturers, and the conclusion derived from his book is that more should be done towards the creation of museums of natural history. But as the need of the time is for museums which shall make men derive increased interest from their trades, we believe natural history can wait. We may differ from Mr. GREENWOOD, but we must recognise that he has spent much toil in amassing information about English and foreign museums, and his book will be useful to many. It suggests how much remains to be done before the country can be said to possess a sufficient supply of museums; and hence it is worth the study of politicians and the public in general.

## ANCIENT ARCHITECTURE AND SCULPTURE.\*

By A. S. MURRAY.

IN the west half of the Lycian Room is the tomb of a Satrap of Lycia, with a roof in the form of a pointed arch surmounted by a ridge. On each side of the roof is a relief representing an armed figure in a *quadriga*; along the ridge are reliefs; on one side a combat of warriors on horseback and on foot, and on the other a hunting scene; in the western gable is a small door for introducing the body of the person interred in the tomb. On one side of the tomb is a relief of warriors on foot attacking cavalry; on the opposite side is a Satrap seated, apparently receiving a deputation; at one end is a draped male figure, who appears to be crowning a nude figure; at the other end are two figures, armed with cuirasses, one of whom appears to be crowning the other. Inscriptions in Lycian characters are incised above this frieze on the north and south sides of the monument, in the frieze itself on the east side, and on the north side of the ridge which crowns the roof. According to the latest interpretation of these inscriptions they record the building of the tomb of Paiafa, a Lycian, for himself.

In the east half of the room is the roof of a similar tomb. On one of the sides of the ridge is a battle-scene between warriors on foot; on the other a banquet, a figure crowning an athlete, and a group of aged figures conversing. Below these reliefs is, on each side of the roof, Bellerophon in a *quadriga* attacking the Chimaera, in low relief; he is accompanied by a charioteer. On the south side of the monument is an inscription in Lycian characters, which, according to the latest interpretation, records the name of Mārāhi, the builder of the tomb, and that of the sculptor employed on it.

In the west half of the room is a restored model of the edifice commonly known as the Nereid Monument, discovered at Xanthos by Sir C. Fellows, under whose direction the model here exhibited was made. In the pedestal on which this model stands are inserted a ground plan, showing the position of the remains when found *in situ* by Sir C. Fellows, and a picture of the scene of the discovery. The monument, as thus restored, is an Ionic peristyle building, with fourteen columns placed round a solid *cella*, and with statues in the intercolumniations, the whole elevated on a basement, *podium*, which stands on two steps. This building was supposed by Sir C. Fellows to have been a trophy in memory of the conquest of Lycia by the Persians under Harpages, B.C. 545; but this is not probable, as the style of the architecture and sculptures shows that it must be assigned to a much later date. Recent authorities suppose this monument to have been erected in the first half of the fourth century, B.C., in honour of a native Satrap or ruler of Lycia, probably the Satrap Perikles, who, as we know from a fragment of Theopompos, attacked and captured the town of Telmessos.

On the walls of the room are the several friezes which decorated the building, some slabs of the broad frieze which is believed to have encircled the lowermost part of the basement, representing a battle between Asiatic warriors, some of whom are mounted, and Greeks. These are placed round the west half of the room. Some portions of the narrow frieze which ran round the uppermost part of the basement, and which represented, according to the most recent interpretation, four scenes—an attack upon the gates of a fortress, the siege of a fortress, the capitulation of a fortress, and battles in the open field. These slabs are placed on the north and south walls of both the west and the east divisions of the room. A slab, in the west side of the room, is an assault upon a fortress with the aid of a scaling-ladder; on the next slab are warriors advancing to the attack in single file; scenes of combat; warriors advancing, probably to attack the fortress, which is represented in the eastern half of the room. On the same wall, and on the opposite wall, scenes of battle, prisoners being conducted in single file. The next three represent probably the same fortress after its capture. On one is a Satrap seated, and attended by a slave holding a parasol over his head; the figures advancing towards him are probably the vanquished enemy tendering their submission. Above the lower line of fortifications is seen a tomb surmounted by a sphinx between two lions; warriors standing conversing, and warriors advancing in single file. Slabs of a narrow frieze which encircled the *cella* of the monument, and which represents a banquet, with a sacrifice of rams, bulls, and goats. On the eastern wall are slabs of a narrow frieze which surmounted the columns of the peristyle, representing a battle of horsemen and warriors on foot. Scenes representing the chase of the bear and wild boar, from the same frieze; also on the adjacent north wall figures bringing offerings. A part of the tympanum of the eastern pediment of the monument, containing sculptures in relief, representing two seated figures, probably divinities,

\* From a description taken from the "Guide to the Exhibition Galleries of the British Museum," of the collection of architectural and sculptured remains obtained from ancient cities in Lycia.

approached by worshippers. One-half of the tympanum of the western pediment contains a relief representing a battle between cavalry and infantry. Above the two friezes in the west half of the room is a restoration of the cornice of the basement, with the columns and statues which surmounted the stylobate. The plaster casts employed in this restoration have been made from figures and architectural members in this room. A column, two portions of columns, and three capitals from the peristyle, and a piece of moulding from the cornice of the basement; coffers of the ceiling; capitals of pilasters; roof tiles and other architectural members; statues which stood in the intercolumniations. They represent female figures moving rapidly, which from the marine emblems under their feet are probably Nereids, or possibly personifications of cities on a sea coast. One has under her feet a crab; the others, a fish, perhaps the tunny, a sea bird, a shell, and a dolphin. Fragments of similar figures; two draped female figures in rapid motion, from the *akroteria* of the pediments; fragmentary groups of youths carrying off female figures, conjecturally placed on the apex of either pediment; lower portions of two figures in rapid motion, from the north and south ends of the west pediment; two crouching lions found at the base of the monument, and in the model conjecturally placed within the colonnade. A representation of similar lions may be seen on the summit of a tomb on slab No. 35, of the narrow frieze of the basement. Three draped female torsos, of an architectural character.

In the east half of the room is a slab representing the bust of Diana in relief between Doric triglyphs, from a Roman arch at Xanthos. In the west half of the room is a square monument of the Roman period, with reliefs of Plutus and Fortune on one side, and a Persian shooting at various animals on a mountain on the other; three pieces of moulding. On the east side of the room are casts from the reliefs of a tomb cut out of the sold rock at Pinara, with representations of an ancient walled city built on rocky ground. On No. 108 are represented tombs near the city, two of which are similar in form to the tombs exhibited in this room. On the same wall are casts from the sculptures of a rock-tomb at Myra, coloured to represent its condition when the casts were made. On the opposite wall are casts from a relief of a draped male figure and from the sculptures of the gable ends of two tombs. On one are two female figures, probably Hierodules, wearing short chitons and dancing; on the other are two lions devouring a bull; above them a Lycian inscription. In the west side of the room are casts from the relief of a rock-tomb at Kadyanda. Near several of the figures are bilingual inscriptions in the Greek and Lycian languages. The group of figures on the extreme left is engraved as the frontispiece of Fellows's "Discoveries in Lycia." On the opposite wall are casts from the sculptures of a rock-tomb at Pinara; a portion of the pediment; one of the Gorgons' heads with which the ends of the dentils were decorated; another from the frieze represents warriors escorting captives. In the west half of the room are casts from sculpture at Tlos; a relief representing Bellerophon attacking the Chimaera, and a monolithic pedestal on the four sides of which are the following subjects in relief—the siege of a city, the combat of two horsemen, of an armed Greek on foot against an Asiatic on horseback, and two combatants on foot; above this pedestal is a smaller base on which are figures in relief.

Towards the west side of the room of archaic sculpture are placed the reliefs from a monument which stood on the acropolis of Xanthos in Lycia, and is generally known as the Harpy Tomb. The sculptures originally decorated the four sides of a small chamber, which stood upon a rectangular solid shaft, about 17 feet high. The style indicates a date probably not later than B.C. 500. The subjects of the reliefs have been variously interpreted; on the sides facing east and west are at the angles Harpies bearing off small draped female figures. Between the pair of Harpies on the east side is a male deity seated, who receives a helmet from a warrior standing before him; under the chair of the seated deity is a bear. Under the Harpy on the right is a small female figure kneeling in a suppliant attitude. Between the pair of Harpies on the opposite side of the monument is a seated divinity of uncertain sex, in front of whom a draped female figure stands offering a dove. The seated divinity holds in the left hand a pomegranate fruit, in the right a fruit or an egg.

On the side now facing the north, but which was originally the west side of the tomb, are two goddesses seated on thrones facing each other. The one on the right holds in her right hand the flower, and in her left the fruit of the pomegranate. The figure opposite holds in her right hand a *phiale*. In front of this figure is an oblong aperture which may have been closed by a stone in the form of a *stèle*. The figure of a cow suckling her calf, above the aperture, would then have formed the *epithema* of the *stèle*. On the right of this opening are three draped female figures, advancing in single file towards the goddess, who holds the pomegranate fruit and flower. The second of the advancing females holds in her right hand a

fruit, in her left a flower of the pomegranate; the third holds up in her right hand an oviform object, thought to be an egg. The goddess to whom these figures advance may be Persephone, and the goddess behind them Demeter.

On the south side is a male deity seated on a throne, and holding in his right hand a pomegranate flower, before whom stands a smaller draped figure offering a cock. Behind this smaller figure a draped male figure, holding a staff in his left hand, advances, accompanied by a hound. Behind the seated deity two draped female figures advance; the foremost of these holds in her left hand a pomegranate fruit. The small figures at the angles carried off by the Harpies have been thought to be the daughters of the Lycian hero, Pandareus. Another conjecture is that these figures represent the souls of mortals snatched away by untimely death. The subjects of the reliefs on the four sides of this tomb have all probably a funereal import, but archæologists differ widely in their explanations.

Along the north and south sides of the room are arranged ten seated figures, a lion and a sphinx, brought from the Sacred Way leading up to the temple of Apollo at Branchidæ, in 1858. These figures are among the earliest and most important extant specimens of Greek sculpture in marble. Their date probably ranges from B.C. 580 to B.C. 520. On the back of the lion is an inscription in five lines, written *boustrophedon*—that is, with the lines beginning alternately from right and left—and in very ancient characters, containing a dedication of certain statues as a tenth to Apollo, by several persons who were probably citizens of Miletus. One of the seated figures represents, as we learn from its inscription, Chares, ruler of Teichioussa, who dedicated this statue of himself to Apollo. On another of the figures is part of the name of the sculptor who made it.

On the north side of the room is a block of marble with an archaic Greek inscription on two sides, recording a dedication of some work of art by the sons of Anaximander, and the name of the artist, Terpsikles. This is also from Branchidæ.

In the centre of the room is a stone chest from the top of a *stèle* or columnar tomb. On one side is a man stabbing a lion; on the opposite side are a horseman, a warrior on foot, and an attendant, in very low relief. At one end is a lioness fondling two cubs; at the other end a lion devouring a bull. From Xanthos in Lycia.

On the north wall are plaster casts of four metopes from two of the temples at Selinus in Sicily. The three complete metopes, representing a chariot group, Perseus cutting off the head of Medusa, and Herakles carrying off the Kerkopes, belong to the oldest of these temples. The fragment representing part of a group of Athenè overpowering a giant is from a later temple. Under these metopes is a marble frieze with reliefs of satyrs and wild animals, from Xanthos in Lycia; and a relief of female figures moving in a procession; from Teichioussa, near Branchidæ.

On the opposite wall is a marble frieze representing a procession of chariots, horsemen, and foot-soldiers; the gable end of a tomb, on which are sculptured two seated male figures facing each other, between whom is an Ionic sepulchral column surmounted by a Harpy; and other similar portions of tombs with figures of sphinxes in relief. Higher up on the wall is a narrow frieze with figures of cocks and hens. These sculptures are from Xanthos in Lycia. To this wall are also attached two plaster casts; the one from an archaic relief on the Acropolis of Athens, the other from a relief in the Villa Albani, generally known as the Leucothea Relief, which in style and subject resembles the reliefs on the Harpy tomb. Along the west side of the room are the following statues and heads:—A draped female torso from a temple at Rhamnus in Attica; a small figure of Apollo brought from the east by Percy Clinton, Viscount Strangford; another figure, perhaps also representing an archaic Apollo, from Greece; a statue of Apollo, of a somewhat later period, formerly in the Choiseul-Gouffier collection; an ancient copy of an archaic head of Apollo, from the Townley collection; four terminal heads of Dionysos and Hermes; fragments of reliefs found under the foundations of the temple of Diana at Ephesus, and supposed to have belonged to the older temple. At this end of the room are placed a plaster cast from the marble statue of Victory, by Paionios, and casts of two metopes from the temple of Zeus at Olympia. The figure of Victory was erected at Olympia to commemorate a battle either in B.C. 425, or between B.C. 456-452.

On the east side of the room are an archaic inscription from Sigeum in the Troad, written *boustrophedon*, recording a dedication by Phanodikos of Prokonnesos, and giving the artist's name Aisopos. This inscription was known to travellers for some time previous to its removal by Lord Elgin, and has been repeatedly published. An inscription from Halikarnassos, in the Ionic dialect, which contains a decree of the people of Halikarnassos and Lygdamis in their joint names, and having reference to the legal title to certain houses and lands of which the ownership was in dispute. The Lygdamis who is named as a party to this decree was probably the tyrant of that name

who ruled at Halikarnassos about B.C. 450. A rock-cut figure of calcareous stone, found near Smyrna in 1869.

On the east side of the room are an archaic inscription from Cape Taenaros in Lakonia, presented by Dr. Mullen, R.N., and recording the enfranchisement of a slave. An archaic inscription from Ephesus, relating to divination by the flight of birds. A bull, probably from the top of a sepulchral *stèle* at Athens. Presented by Lord Hillingdon.

On a shelf and in a case against the east wall are placed architectural fragments from the site of the temple of Apollo at Naukratis, discovered by Mr. W. Flinders Petrie, and presented by the Egypt Exploration Fund.

#### GLASGOW ARCHITECTURAL ASSOCIATION.

THE first lecture of the session was given on Tuesday, the 18th inst., by Mr. Thomas Gildard, president, on "Recollections and Reflections." The lecturer's experience of professional life dates back for some fifty years, when as an apprentice he entered the office of Messrs. David & James Hamilton, then among the first architects in Scotland, and well known by works of such importance as Hamilton Palace, Glasgow Royal Exchange, Western Club, &c. From their office came several who themselves earned reputations with designs which adorn the city. Of these were Mr. Charles Wilson, architect of the High School, Faculty Hall, Queen's Rooms, Free College, &c.; Mr. Richard, known by his Wallace Monument, Park Church, Bank of Scotland, &c. Reminiscences of these and many others were given, a comparison with present practice showing how great is the change. Their success must be appraised with a remembrance of the difficulties overcome, lack of travelling facilities, and the limited professional library at their disposal. The art of ancient Rome was then alone favoured, giving place later to a purer style, when the publication of such books as Stuart and Revett's "Athens" discovered the fount of Classic architecture. The still later change of popular taste—the revival of Mediævalism—disturbed yet again professional conservatism, and Mr. Gildard gave a review of the earlier efforts in the new style. The latter part of the lecture was devoted to a consideration of the principles which influenced the designers in these varied phases of art, and which should rule with their successors, even when an extended range of material, such as cast-iron and plate-glass, is called for by the altered social condition of our times. At the conclusion of the paper, after remarks by Mr. John Baird, architect, a former office companion of Mr. Gildard, a vote of thanks was passed to the lecturer.

#### EAST SHEFFOLD OLD CHURCH.

THE restoration of the quaint and interesting church of East Shefford has been carried out by Mr. Walter Money, F.S.A., who has furnished the following account to the *Reading Mercury*. The restoration, Mr. Money says, of this ancient building has been carried out in a most conservative spirit, the greatest caution having been exercised lest the history of the structure should be obscured, as that of many of the neighbouring churches has been, by ignorant innovations, or valuable remains of past ages be destroyed in deference to mere utilitarianism.

It may always be assumed, in default of proof to the contrary, that every Mediæval church stands on the site of a Saxon one, that almost every Saxon one occupies the site of a Romano-British church, and that every such church took the place of a heathen temple. That this was the case at East Shefford there is little doubt, and the repairs recently carried out have disclosed evidences of a much higher antiquity than the date usually assigned to it. There remains in the church a Norman font of stone, which at some time or other has been displaced, and fixed on a bed of brickwork. It was originally supported on a round pillar or stem in the middle with a small shaft at each of the corners. The central stem, which is perforated to act as a drain from the bowl of the font, has been discovered in the church. By a constitution of Edmund, Archbishop of Canterbury (A.D. 1226), fonts were required to be covered and locked when not in use, to prevent people obtaining the holy water for improper or superstitious uses, such as those of sorcery, and the supposed healing of diseases ("Fontes baptismales sub serâ clausi teneantur propter sortilegia." Lyndwood's "Provinciale," p. 247). On the font at East Shefford the remains of the hinges and staple to fasten the cover may still be seen.

A very interesting memorial, intimately connected with the consecration or reconsecration of the church has been brought to light in cleaning off the many coats of whitewash, viz., a consecration cross, incised into the stonework of the north pier of the chancel arch. The form is that known as the cross *pommée*, 3 inches by 2 inches in size. An important part of

the ceremony of consecrating a church, as it was practised before the Reformation, consisted in crosses such as these being marked upon the walls by the officiating Bishop with oil of chrism, at twenty-four different places, distributed equally throughout the building; that is, three crosses on the north, south, east and west walls respectively, both inside and out. It was the custom, both in England and on the Continent, to mark beforehand the places where the Bishop was to anoint the walls with chrism. This was done by crosses of various shapes and sizes being carved in stone, or modelled in plaster, or painted (generally in red), or lastly by metal crosses affixed to the walls. In some cases two of these methods were employed in the same cross. In churches that are built of rubble stonework with ashlar dressings, as is the case at East Shefford, the crosses are often to be found on buttresses, angle-stones and door jambs; places selected on account of the smooth dressed stone affording a better surface for painting or carving. In most cases, however, rough walling in Mediæval churches, whether inside or outside, was covered with stucco. Modern "restorers" generally cut this away, under the notion that bare stone walls are Mediæval, and many consecration crosses have been destroyed in this manner. There also remains on one of the quoin-stones of the aisle on the south side of the church what, most probably, was intended for a consecration mark, though it is not a cross. This kind of figure occurs so often in positions where we would expect to find a consecration cross, that it seems evident it was meant for one.

The exterior work done includes a sunk channel gutter round the church, lined with blue Stourbridge bricks, to carry off the water from the roof and walls, and thus keep the foundations dry; making good the defective tiling of the roof; new eaves and guttering; repair of walls of church and churchyard, and of the bell turret, with regilding and reparation of the weathercock, fixing wire lattice-frames over windows and door of chancel, to admit of their being left open for ventilation without the monuments being exposed to injury, and general attention where required.

In the interior the magnificent fifteenth-century alabaster altar-tomb, with recumbent effigies representing Sir Thomas Fettiplace and his wife, Lady Beatrix, who had previously been the wife of Gilbert Lord Talbot, has been most carefully repaired, and is now the great feature in the interior of the church. No inscription or coat-of-arms are to be found on this tomb, but it is supposed that a narrow fillet of brass, which bore the legend, has at some time been abstracted, or removed from round the verge of the slab bearing the recumbent figures. But it is worthy of remark that at this period monumental effigies of wealthy persons were frequently covered with a slight open frame of wood, brass, or iron, richly gilt, and furnished with lights, called a *herse*. It somewhat resembled the wooden ribs of a waggon cover, and was intended to support the pall, or herse-cloth. An example still remains in the Beauchamp Chapel, Warwick. Such a canopy as this may have been placed over the monument at Shefford, and fixed on the place where we usually expect to find the inscribed band on these altar-tombs. As some slight confirmation of this theory, a small piece of this plate, of latten, or brass, was found in repairing the monument, and, further, the letter "M" in Lombardic character of a never-completed legend has been detected in the hollow of the cornice, on the south side of the monument.

The very fine Purbeck marble tomb to John Fettiplace and Dorothy his wife (1524), on the north side of the chancel, has also received careful attention. There is no doubt, judging from the special features noticeable in its construction, that this tomb was used for the Easter Sepulchre. In the wish to be buried at some particular spot on the chancel's northern side, and in those injunctions for the architectural adornments of the grave to be so fashioned that "there might always be set the Easter Sepulchre upon the tomb," we meet with another proof of that eagerness in bygone times to be prayed for when dead which was felt by him who could have his wish fulfilled in the matter. While doing this, the owner of the soil, or the lord of the manor, sought to avail himself of those opportunities for getting his soul best remembered, which were afforded by the solemn and impressive Easter ceremonies of the ancient ritual, which once in every year were sure to bring all the people in crowds to the parish church. This highly interesting tomb is 8 feet high and 5 feet 9 inches wide, constructed so as to form a recessed altar-table, with a groined canopy, of the most elaborate and costly workmanship, the sides being filled in with rich tracery, surmounted by an enriched trefoiled entablature. Such a work as this represents a long period of patient labour, and the various architectural members are characterised by an elaborate richness, combined with the most elegant lightness. Few churches possess two more interesting monuments, which, by trouble and care, have in great measure been restored to their original beauty.

The floor of the chancel aisle has been raised to one uniform level, and the nave repaved on a bed of concrete, the ancient

encaustic tiles being relaid in their original position as far as practicable. The walls of the nave, which were in a ruinous condition, have been thoroughly repaired, and a dado in cement carried round to a height of 5 feet. The stone coffin-lid of an early date, bearing a triple cross, has been placed on four brick piers on the south-west of the nave, just parallel to where it was found on the outside of the wall. Many other small repairs have been carried out, which it is unnecessary to particularise in detail. The whole of the unsightly arrangement of high wooden pews, with the formidable "three-decker," the materials of all of which were for the most part in a state of utter decay from dry rot, have been removed, and it is proposed to substitute for them eight neat open seats and a lectern, which are required for funerals, the church being still used for this purpose, being surrounded by the old and only churchyard in the parish. Several repairs and improvements, moreover, are needed in the churchyard itself to put it in good and decent order.

It remains for me to say that the structural repairs have been well executed by Mr. Wooldridge, of Hungerford, and the reparation of the monuments has been effectively carried out by Mr. Pound, of Speenhamland, with a due regard to the demands of a truly conservative and antiquarian sentiment.

### THE SURVEYORS' INSTITUTION.

At a meeting of the Fellows of the Surveyors' Institution resident in Lancashire and Cheshire, lately held in Manchester, the question of the formation of a provincial committee of the Institution for the two counties, on the basis of the scheme for the local organisation of members throughout the provinces, was considered. The Secretary of the Institution explained the constitution of the new committees and the objects the Council have in view in their formation. Mr. John Cross was elected chairman of the committee for the ensuing year, and it was resolved that the committee be designated "The Provincial Committee of the Surveyors' Institution for the Counties Palatine of Lancashire and Cheshire." The committee then proceeded to consider the arrangements for the preliminary examination for the admission of students to the Institution, to be held at Manchester under the auspices of the committee on January 22 and 23 next. Messrs. J. Holden, T. Silk Wilson, E. J. Bridgford, and T. A. Dickson were appointed moderators for the purpose.

### A LEANING STEEPLE AT COVENTRY.

THE following particulars concerning the steeple of St. Michael's Church have been published in the *Coventry Herald* by Mr. Andrews, one of the city councillors:—

In the year 1818 the upper 24 feet of the spire was taken down and rebuilt. The builders at that time must have known that the steeple was out of perpendicular, for they rebuilt the 24 feet exactly upright, so that previous to the present restoration there was a bend in the spire where the portion which had been rebuilt joined the old work. Yet it would appear that all knowledge of this had perished, for the discovery by the contractor at the commencement of the present restoration that the tower was not upright came upon us as a surprise. It will be recollected that when the discovery was made, I at once suggested that the steeple should be plumbed from the summit, so as to ascertain the total deviation from the perpendicular. A wire was suspended without delay, and an account of my observations was published in the local press about three years ago. Now that the work is approaching completion, and the steeple settled upon its new foundations, it seemed to me that fresh measures of the leaning should be made before the scaffolding was removed, in order to hand down to our successors an exact knowledge of the extent to which the steeple leans from the perpendicular. We, therefore, suspended a fine copper wire from the centre of the spire at the apex of the hollow, 267 feet above the floor of the church. A sixteen-pound iron weight was hung at the bottom of the wire, and suspended in a bucket of water in order to prevent it swaying with the wind. Measures were made by myself and the clerk of the works (Mr. Webster), with every precaution to avoid error, on two calm days in July. On one of these days the weathercocks indicated an E.S.E. wind (or *with* the leaning of the steeple), and on the other day a N.W. wind (or *against* the leaning of the steeple). A mean of the measures gives the following results:—

	Out of perpendicular.
Centre of lead floor at octagon . . . . .	23 inches.
Centre of steeple at 267 feet . . . . .	38½ "
Base of weathercock at 290 feet . . . . .	41½ "

In order to test these results I had the wire suspended from the centre of the lead floor in the octagon (132 feet from ground) to measure the leaning of the tower only, and sets of measures were taken upon several calm days both in July and also in the present month, and these were finally verified by the

city surveyor (Mr. Purnell). No sensible difference was found between these measures and those made when the full length of wire was used. St. Michael's steeple, therefore, is 3 feet 5½ inches out of perpendicular. It is proposed to place two marks upon the pavement inside the tower, one of which will be in the centre of the tower, and the other exactly under the weathercock. They will of course be 3 feet 5½ inches apart.

It does not, however, require any measuring to see that the steeple is not upright. The leaning is visible to the naked eye. From the far end of Grey Friars' Green, where the steeples of Christ Church and St. Michael's are nearly in a line, it is easily seen that St. Michael's leans to the left, whilst from Ford Street, near the City Mill, it is seen to lean to the right. The direction in which the steeple leans is 37 degrees N. of West, or towards the Free Library.

The lean of St. Michael's steeple as given by the *Herald* above is nearly identical with that of the Belfry in Bruges—a deflection from the perpendicular which is very perceptible from the northern points of the city.

### TESSERÆ.

#### Building Accounts of Westminster Abbey.

SIR G. G. SCOTT.

AS Westminster Abbey is about the earliest work of its style in this country, and as the building of the first portion of it by Henry III. extended over a space of twenty-four years, *i.e.* from 1245 to 1269, it becomes important to ascertain how early in this period the style of its architecture can be proved to have been defined. Now a single entry in the fabric rolls has for ever settled this point. I have before stated that the most advanced part of the work as to style is the chapter-house, as that contained traceried windows of four and five lights in a very developed form; the tracery is not confined to circles, but containing great quatrefoils, and the heads of the lights being trefoiled, which is not the case in the church. Now it would be most useful to know the exact date of these windows, for though Matthew Paris gives 1250 as the year of commencement of the chapter-house, it may have spread over an indefinite length of time, and the windows have belonged to twenty years after that date. Let us look then to the bills. Here we find, in a roll bearing date 37th Henry III., or 1253, and expressly called the eighth year from the beginning of the work, an item of "300 yards of canvass for the windows of the chapter-house," followed immediately by items for the purchase of glass, showing that the windows in question were completed in 1253, which I see was the year before the king, in company with St. Louis visited the Sainte-Chapelle at Paris, which was then scarcely completed, and the style of which indicates exactly the same degree of advancement. I find also that during the same year the beautiful entrance or vestibule to the chapter-house was erected. The church itself was by this time—indeed, as early as 1249—in a state of rapid progression, so that the architecture must, in the main, have been quite settled from the time of its commencement. The entries are, for the most part, of a somewhat general character; but it is stated in the Pipe Rolls that further particulars have been sent in to the Treasury. These bills of particulars have it is feared been for the most part lost, but Mr. Burtt has succeeded in finding one complete one for about half a year (probably 1253), which is a perfect bill of quantities of the work done during twenty-five weeks, giving the names and measurements of every moulding and every detail of the work. It forms a very curious and interesting illustration of the architectural nomenclature of the period. Attached to it are two amusing little letters from the quarry master at Purbeck, promising shiploads of marble, and begging for speedy orders on the ground of other pressing business. The notices I have adverted to in the fabric rolls of the works, from Edward III.'s time onwards, are also very detailed, and give curious particulars as to the mode of employing men at that time. They appear to have been fed and clothed by the employer, and the clothing would appear to be by no means to be complained of. In one year we have an entry of 15s. (equal to 8s. or 10s.) for a fur robe for the chief mason; but another year nothing is entered for his robe, because this independent gentleman "refused to receive it on account of the delay in its delivery." Going back to the earlier accounts, I may mention that extensive works appear to have been going on at the same time in the palace and its chapel, including a great deal of decorative painting; also that the belfry of the abbey was being built, which I think stood somewhere westward of the church, and of which I believe that some remains existed at a somewhat recent date. The outlay upon the abbey during the first fifteen years of the work would, if translated into our money value, considerably exceed half a million.

#### Finger-Rings in Antiquity.

S. SMIRKE, R.A.

The love of ornament which distinguishes all Eastern nations at the present day seems to have equally prevailed

among the ancient Assyrians, of whom representations are for the first time brought before us in the remains discovered by Layard. Very few female figures occur, but scarcely a male figure is represented, whether priest or warrior, without large earrings, and most of them have necklaces, bracelets and armlets. It is to be remarked, however, that not a single case occurs, amidst all this display of personal jewellery, of a finger-ring; the entire absence of this ornament in sculpture, wherein details of this nature are so elaborately and carefully attended to, leads to the unavoidable conclusion that the finger-ring was an ornament unknown to the Assyrians. I am not about to digress into any question of the antiquity of finger-rings, an inquiry for which I am not competent. I will only take occasion to say that much of learned disquisition as there has been on this subject, the question remains to be answered. I think there has been much confusion produced by the vague use of the word ring, and the too ready assumption that when rings are named, finger-rings are intended. Signet-rings may have been, and were, worn suspended from the neck or attached to a chain. There are in the Book of Esther and in Jeremiah very clear allusions to finger-rings, but the earliest Classical authority that I am at present aware of is Pausanias, who says that he saw on the walls of a temple at Delphi a painting by Polygnotus of Phocis, represented with a ring on his left hand. Polygnotus flourished about 422 years before Christ. It is, however, very remarkable, if it be true, that there is no example known of a Greek statue with a ring on the hand.

#### Mediæval Tie-Beams.

R. BRANDON.

In the churches of the Middle Ages a perfectly horizontal tie-beam is of extremely rare occurrence. Where a tie-beam is used, we almost invariably find it cambered, as are also the collar-beams; even the hammer-beams will be generally found, on close inspection, to incline upwards from the walls. The disagreeable effect of a straight tie-beam was often further counteracted by having curved braces framed from its underside, connecting it with the wall-pieces, thus forming an arched support for it, as at Outwell Church, Norfolk. In roofs of higher pitch the builders still endeavoured, with varied success as to effect, to retain the arched shape in conjunction with the tie-beams. A curious specimen exists at the church of St. Mary the Virgin, Pulham, Norfolk, where the beam literally divides the arch in two. As the Perpendicular period drew towards a close, tie-beam roofs of very low pitch were of general occurrence; in fact, they were frequently almost flat, with no more rise to throw off the wet than could be obtained by the camber of the beams. These roofs were oftentimes profusely ornamented, as in that over the north chapel of Wellingborough Church, Northamptonshire. In this instance, the eastern bay, as was very frequently the case, is panelled, while the others are left open to the rafters.

#### Leon Baptiste Alberti.

C. R. COCKERELL.

When searching for manuscripts in 1416, Poggio Bracciolini discovered a copy of Vitruvius, "covered with dust and rubbish, in a tower not fit to receive a malefactor," he says, "at the monastery of St. Gall, at Constance." Copies of this happy revelation were spread amongst the learned until the invention of printing, in 1445, multiplied them amongst the great architects of the day—Brunelleschi, Cæsariano, Bramante, and others. The magnificent Alberti was one of the chief of these, but not finding in Vitruvius sufficient to inform and fire the student's mind, he composed that work which all competent judges have esteemed the most masterly compilation in the art extant. "Seeing," he says (lib. vi.), "that of all antiquity Vitruvius alone has reached us, that such chasms and imperfections appear in his work, that his help is insufficient: his language, too—Greek to the Romans, and Latin to the Greeks—leaves so much unintelligible, I thought it the duty of an honest and a studious mind to free this science from ruin; though the rehearsing without meanness, reducing to a just method, writing in an accurate style, and explaining perspicuously so many various matters—so unequal, so dispersed, and so remote from the common use and knowledge of mankind—certainly required a greater genius and learning than I can pretend to," &c. But he did not confine himself to the theory of his art. As a scholar, a mathematician, a Platonist, and of a noble family, he associated with all the greatest spirits of his day, and was intimate with the living masters and the progress of their works. Whatever comes from him, therefore, is generous, moral, philosophical, practical, and elevating: he proves himself truly of the order of cavaliers; he mounts you upon his horse, which quickly you find a Pegasus; he raises you above the vulgar cares and labours of this nether world, and in his airy flight he shows you all the kingdoms of the world and their handiworks; and then he sets you down, cheered, instructed, delighted, and exulting in your profession. The only English edition is that of Leoni, 1755. The spirit of that day deemed art a primary instrument of civilisation; it became

the least and the occupation of the little courts of the rival states of Italy; literary societies, discussions, and conversations, discovered and refined upon the true principles of poetry and of fine arts; and a Bembo, Sadolet, Annibal Caro, Castiglione, Aretino, and a host of literary stars, all contributed their zeal and means to the æsthetical intelligence of artists. Architecture became the field of poetical imagination: and we have the *Υπνοτερομαχία*, "The sufferings of love in a dream," by the learned friar, Colonna, in which the wonders and delights of the art, and of its theories (full of original and beautiful conception, the source from whence the artists of the day drew continually), are accompanied with the romantic and amorous adventures of blighted love, of which the author was the victim.

#### The Sculpture of Wells Cathedral.

R. WESTMACOTT.

The sculpture which decorates Wells Cathedral is, of course, very rude in point of art; but it is of great interest, from the character of the designs, and from the date of its execution. It illustrates various subjects of scripture, history and acts in the life of our Saviour, besides recording, in statues of heroic size, the memory of saints, kings, queens, and others who were probably patrons and benefactors of the Church. Another circumstance of interest is that it seems to be the earliest example in this country of such sculptural enrichment exhibiting a connected series of scripture illustrations; but its importance may be still greater if, as has been conjectured, it is the first specimen of the kind known to exist in Western Europe. Its origin, then, becomes a question of some importance. It is not improbable that some of the earliest Italian practitioners may, in their wanderings, have penetrated as far as England; but the style of the sculpture certainly does not resemble that of the Italian artists who undoubtedly were employed on the tombs of Edward the Confessor and of Henry III., and, therefore, it is not so easily associated with the art derived from that source. Flaxman, admitting this, was disposed to think it was derived from the East, conceiving that, as it was not Italian, it might have been founded on examples seen by the Crusaders, a speculation which has little probability to recommend it. That the Crusaders influenced the civilisation of Europe must be conceded, inasmuch as many of the ingenious Eastern arts became known and were introduced by those who returned from those wars; but it scarcely can be likely that any light could be thrown on sculpture by the practice of the Eastern nations. No writer seems to have allowed himself to think it possible that the English could have been capable at any period of their history of producing such art as was required for the decoration of their sacred and other edifices, even of the rude and primitive kind under consideration, and therefore all have taxed their ingenuity and invention to give the honour of it, such as it is, to any rather than their own countrymen. The preponderance of the foreign element in the Courts of the sovereigns of England, and the little knowledge of, or feeling for, art in the higher classes, have always tended to depress or ignore the attempts of native artists to do at home that which the artists of Italy, France, and Germany effected for the credit of their respective countries; and on all occasions, till a comparatively late period, foreign painters and sculptors were preferred and employed. Want of opportunity and want of practice, all-sufficient causes in themselves of inferiority, were assumed too often by those but little competent to judge to be proofs of national incapacity; and till Christopher Wren vindicated the honour of his country in architecture it seemed never to have occurred that an Englishman could make himself worthy to take the position of a real artist.

#### Flexure of Wrought-iron Plates.

E. CLARK.

If we take a wrought-iron plate of considerable length in proportion to its thickness, or use it as a pillar lengthwise, and imagine its dimension varied, we have to inquire what corresponding variation will take place in its resistance to flexure. We can only make it wider, longer, or thicker, and we will separately consider each such variation. First, if we make it wider its resistance to flexure will evidently be proportionate directly to its width. If we make it, for instance, twice as wide, each half exerts the same resistance to flexure, whether they are separated or united; and consequently, doubling the width is merely doubling the amount of material to be curved, or doubling the strength. Secondly, if we make it longer, it will follow from the laws of pillars that its strength will be inversely proportionate to the square of its length; for the strength of a pillar varies inversely as the square of its length. The plate may be considered as a number of square pillars placed side by side, the deflection being merely confined in direction by their junction, but the resistance of each pillar to flexure remaining unaltered, and consequently the resistance of the whole. Thus an inch plate, 12 inches broad and 12 feet long, is evidently the same thing as regards its bending under these circumstances as twelve separate pillars each 1 inch square and 12 feet long, placed side by side and bending in a similar direction.

## NOTES AND COMMENTS.

THE forthcoming session of the Architectural Association will be opened on Friday evening, October 5, by a *conversazione* at the Westminster Town Hall. The first ordinary meeting will be held on the 19th prox., when the president, Mr. H. D. APPLETON, F.R.I.B.A., will deliver the inaugural address. A good programme of lectures has been arranged, which will be delivered at the usual fortnightly meetings, as follows:—"Elizabeth and Victoria," by Mr. J. A. GOTCH; "Arches and Vaulting," by Mr. A. T. WALMSLEY; "The Development of Irish Architecture from the Early Celtic Work to the Eighteenth Century," by Mr. J. L. ROBINSON, A.R.H.A.; "Symbolism," by Mr. DOUBLEDAY; "London Street Architecture as it is and as it might be," by Mr. FRANCIS MASEY; "The Architecture of Support and the Architecture of Equipoise," by Mr. E. RADFORD; "Artificial Illumination," by Mr. J. SLATER, B.A.; "The English Classic Revival of the Seventeenth and Eighteenth Centuries," by Mr. J. M. BRYDON; "The Life of an Old Parish Church," by Mr. J. T. MICKLETHWAITE, F.S.A.; "Architecture in Oxfordshire," by Mr. W. A. PITE; "Sussex and its Architecture," by Mr. LACY W. RIDGE; "Wrought-iron Door Furniture—Ecclesiastical," by Mr. J. STARKIE GARDNER; and "The Travelling Student's Notes," by Mr. D. J. BLOW.

MDLLE. ROSA BONHEUR does not lose courage with the advance of years. The painter, who made a name in England by her *Horse Fair*, as time runs on appears to seek more ferocious animals than horses and cows. Mdlle. BONHEUR recently requested permission to paint in the menagerie of M. HAGENBECK, the JAMRACH of Hamburg, but that gentleman courteously offered to send some of his specimens to the artist's studio, with a keeper to insure safety. Mdlle. BONHEUR selected three panthers to start with, and when they serve their turn as models M. HAGENBECK will supply any others which may be desired.

WE give this week some extracts from the Guide to the British Museum published this year, and these should show that visitors to our great national collection of antiquities will find therein all the information they can desire concerning the objects exhibited for their instruction. But to derive practical benefit, such a guide should be read at leisure prior to a visit or visits to the museum in a preparation for study of the collections *seriatim*. The compilers of the guide have done their part ably, and have given more information and have expended more time and labour on the compilation than is usual in such publications. Guides are chiefly valuable for library use. Few would wish to see the British Museum, or any of our other museums, turned into lecture-halls. The lecturer is, as a rule, out of place in a museum, where the visitor or student should be allowed to see its contents for himself, and in quiet. He can think over the subject, or, if need be, refresh his memory from such a guide-book, or from his own notes, or, indeed, as in the case of some museums, a brief question would elicit from the attendant a reply, both courteous and to the point, about any particular object under his care. This is a different thing entirely to the typical beef-eaters or to lecturers discoursing to an admiring following of rustics and 'Arries. That such attendants as those we have in mind are to be found is proved by the fact that they exist in the great museum at Naples. All who have visited that noble collection will remember what a fund of information the custodians of the various galleries there were able to impart when such service was asked of them, and of how useful a character it was.

FRANCE was never more eager to erect memorials of her worthies than in the present time. Scarcely a month passes without an announcement of a project for a work of that class. The latest comes from the literary and artistic society of the department of Lot, and has for its object the erection of a memorial of CLÉMENT MAROT, the poet, who was born in Cahors in 1495. His life was one of vicissitude. He was brought up as a page in the French court. After the battle of Pavia, he shared the imprisonment of FRANCIS I. On returning to France his heretical opinions

brought him to a dungeon in the Châtelet. Finally he died of want in Turin. MAROT, in the sixteenth century, was the representative of that *bon sens* which is supposed to be the characteristic of French literature, and from his wit he was competent to hold the office of court jester. BOILEAU recognises his "elegant badinage," but it is not to be expected that people will care to give much study to his works, and accordingly there is more need for something to keep his memory from oblivion. The designs for the memorial are the work of MM. CALMEN and RADALOSSE. The structure is to be Renaissance in style, and will be placed on a site near the street in Cahors which bears the name of the poet.

THE Corporation of Nottingham have just presented to Mr. FELIX JOSEPH a beautifully illuminated address of thanks, enclosed in an elaborately carved oak album. This presentation was made through Mr. Alderman RENALS, J.P., chairman of the Castle Museum and Art Gallery Committee, as an expression of their gratitude for the loan of his splendid collection of old Wedgwood ware, and for the many rare and valuable gifts made to this institution since its opening in 1878 by the Prince and Princess of WALES. The entire work, which is an excellent example of local talent, was carried out under the personal supervision of Mr. GEORGE HARRY WALLIS, F.S.A., the curator of the museum, the carving being done by Mr. MIDDLEBROOK, and the illumination by Mr. ARTHUR MARSHALL, A.R.I.B.A.

It must be regretted that obstacles should be put in the way of the project of the committee who have been willing to expend trouble and time, in addition to money, for the purpose of preserving Kirkstall Abbey for the country as well as for the district. The honorary secretary of the committee, Mr. GEORGE HILL, however, now shows that difficulties have arisen. After stating that negotiations had been opened for the purchase of the estate, and that one of the members of the committee had engaged to advance the necessary money if terms of purchase could be agreed upon, he added that the committee was anxious that the abbey and grounds should not fall into the hands of speculators for any purpose, and had determined to take upon itself the entire risk of not being able to effect a transfer of the estate to the town of Leeds, or to some other disinterested trust. With these objects in view, the committee made a formal offer to purchase the abbey and grounds, on terms, conditions, and restrictions suggested by the vendors. In reply the committee has now been informed, on behalf of Lady CARDIGAN, that its "offer cannot be entertained, but that the abbey will shortly be offered by auction." In conclusion he says the committee regrets that Lady CARDIGAN has determined to submit what her ladyship recently described in the press as "the ruins of her grand old abbey" to the risks of a public auction.

THE latest instance of the *entente cordiale* between Russia and France is rather odd in form, being neither more nor less than a paving-block. The officer who has charge of the finance of the Russian section for the International Exhibition, and who is also one of the Emperor's councillors, has sent a sample of the kind to Paris, and it is in consequence received with as much interest as if it were a diplomatic communication from the Russian Foreign Office. The block appears to correspond with one of the numerous substitutes for stone with which we are familiar in this country. It is said to be made up of powdered granite. Similar blocks were laid in the space around the cathedral of St. Isaac, in St. Petersburg, eighteen years ago, and have withstood all the traffic. It is also claimed that the paving is as noiseless under carriages as wood pavement. The Russian block is interpreted to be a token of sympathy by the Parisians, but business, not sentiment, is what is really sought. It is proposed that the Russian pavement should be tested near the Opera House, and if it should succeed there to be afterwards employed in the streets of the city. With all their enthusiasm for their new ally we can hardly believe that the Municipality would go so far to discover a material for pavement. Much cheaper blocks are obtainable in places nearer Paris than is St. Petersburg.

## EXCAVATIONS IN CYPRUS.

THE work of the Cyprus Exploration Fund, carried on by members of the British School at Athens during the past winter and spring, has been more than once referred to in these columns. We are now in a position, the *Times* says, to present our readers with a more detailed record, based upon the reports of Mr. Ernest Gardner, the director, and of Mr. R. Elsey Smith, the architect of the expedition.

A preliminary tour of exploration was made in December by Mr. Gardner and Dr. F. H. H. Guillemard, who visited the ancient sites of Cerynia, Lapithus, Soli, an early Phœnician temple on the Limniti river, Polités Chrysokhon (probably Arsinoë), and new and old Paphos. On a later occasion Mr. Gardner also visited Amathus and Curium. Various circumstances delayed active operations until February, when Mr. M. R. James conducted the excavation of a hill called Leontari, near Nicosia, containing traces of early houses and walls, deep cuttings in the rock, a massive fort, and archaic tombs. No decisive evidence was forthcoming as to the date of the massive walls of the fortress, which are attributed by some competent authorities to Roman times, but are more probably Mediæval. The top of the hill, however, was occupied on the north by a network of primitive walls, mixed with early pottery and other objects pointing to a remote period, and by an early wall of fortification, replaced in later times by the massive one still extant. On the south of the hill lay tombs of an equally archaic period, which yielded about two hundred vases and other objects in bronze, lead, and silver. The rock of Leontari is a remarkable elevated tableland of sandstone formation, rising 130 feet above the surrounding plain, and 520 feet above the sea-level; it has a steep cliff at the top running all round the hill, which renders access difficult. The hill, having a circumference of nearly a mile, offers too long a line of defence for the men who could find refuge on it; advantage has, therefore, been taken of a narrow neck of land, which divides the hill into two unequal portions, to form an inner citadel of the smaller northern half. It is here that all the traces of building were found; the tombs all lie beyond the wall on the southern half of the hill. This arrangement recalls the general plan of the fortress of Tiryns, but at Leontari the inner citadel itself has a circumference of almost the same length as the whole fortress of Tiryns. Relying for the most part on the natural slopes of the hill for defence, the inhabitants only raised a wall across the isthmus at one exposed point. This wall, like all those in the northern hill, was built of small, unhewn stones, laid without mortar and carefully fitted. Nowhere, however, is there more than a single course flush with the ground. The wall was 6 feet broad, and had a large tower 60 feet square at its west end, and possibly another at the east. A few feet south of this wall are extensive remains of a far more massive structure, consisting, likewise, of two great towers and a curtain wall. The west tower, which is the most perfect, consists of a single chamber 32 feet by 57 feet, with walls 16 feet thick. The curtain wall is 10 feet thick. The inner lining of the towers consists of good ashlar work, while the outer facing of the walls, above a plain base, consists of very fine rusticated work, *i.e.* blocks having a raised centre panel with a broad chisel draught all round. The core is entirely of stone, set in a hard white mortar, and laid in courses about 2 feet high, containing here and there stones of the full height of the course, but mostly built of smaller stones. To sum up, we seem to have in Leontari Vouno traces of a very early settlement, as evidenced by the tombs, to which we may refer the slighter early walls, while the more massive walls belong to a later occupation, probably in Mediæval times.

The principal work of the season, however, has been the excavation of the great Temple of Aphrodite at Old Paphos. As one of the two or three great centres of worship in the ancient world, this site seemed almost certain to yield important results. It has never been excavated, although such an authority as the Central Archæological Institute at Berlin had

long held its excavation to be most desirable. Digging was begun upon February 3, and carried on without intermission until May 5. The actual site of the temple having been ascertained by the cutting of deep trenches in various directions, the whole of the accumulated earth was gradually removed, so that not only was the plan left clearly visible, but the inscriptions and other antiquities scattered about could not fail to be discovered. First, as to the temple itself. It is known to have been of great antiquity and of Phœnician origin, and it was apparently but little altered by the Greeks when they became the ruling power in the island, for nowhere on the site were found traces of any building at all resembling the usual Greek temple. In Roman times it was twice damaged by earthquake—in the early part of the first century and towards the close of the second. Each time it was restored with great magnificence, but although the Romans made important alterations and additions they do not seem to have wished to change the main character of the building, or even to any great extent the arrangement of the various parts. Coins exist of Roman times giving a view of this temple, and showing a tall central chamber or cella, with lower chambers or porticoes on either side, and a court in front enclosed by a wall with gates. A coin of Byblos, a town on the Phœnician coast, shows a temple of very similar structure, with a large court surrounded by a wall containing the sacred cone, and entered on one side through a lofty portico. We have a tolerably full description of one building—Solomon's temple at Jerusalem—which may practically be considered a Phœnician temple, though no doubt modified by the circumstances of its construction. In the main there is a strong correspondence between the temple at Paphos and the account of Solomon's temple given in the Second Book of Kings. In both we get a series of large outer courts; in both a lofty central chamber of small dimensions, flanked by lower ones. A diagram has been prepared showing the general plan of the buildings. Walls of a date earlier than Roman are indicated by dark bands, while the Roman work is shown by cross hatching. In each case the dark shading indicates such walls or fragments as are actually laid bare or found *in situ*, the dotted lines those walls or portions of walls for which there seemed to be sufficient evidence to warrant them being shown on the plan. Every part of the site which could be examined at all has been explored down to the rock level. The temple stands on a considerable elevation above the sea on ground which slopes gently seawards for some distance, and then dips suddenly down about a mile from the coast. This elevated ground is bordered on the west by the deep ravine of the river Bocarus, and on the east by a gorge which contains a river bed, usually dry.

The plan falls into two main divisions:—(1) the south wing, standing detached; (2) a quadrilateral enclosure, containing various halls and chambers. (1) The south wing seems to have been the earliest portion of which any traces remain. It consists of a large hall or court, bounded on the west by a fine wall of massive blocks, standing on a basement of rough stones, with a carefully-prepared upper bed. Between this court and the great quadrangle are remains of some irregular chambers and some pier bases; it seems probable that these bases may have been part of a triple avenue leading to the court, so that if this were the original shrine we should have an arrangement similar to that on the Byblos coin. (2) The rest of the site is occupied by buildings of later construction than the south wing, and probably added as the temple gained in renown and wealth. Taking the various parts of these later buildings as they occur on the plan, and commencing from the south, we find stretching across the whole width of the site a great hall or stoa, with a row of columns down the centre. Though the construction is Roman, there is good ground for believing that the general character of earlier buildings is here, as elsewhere, retained; of such earlier and smaller chambers sufficient traces remain to allow of fairly accurate restoration. The stoa was probably roofed, and entered from the south by a projecting portico. Running round the walls inside is a broad platform 2 feet above the general floor level; from the low wall which supported this platform project a series of small corbels to carry a seat. The floor at the lower level consists of a geometrical mosaic, carefully laid in marble of delicate natural tints. This was probably the portion of the temple to which worshippers would be first admitted, and would thus answer to the outer court of Solomon's Temple. Under this mosaic floor were found several inscriptions, the marble head of Eros, and various fragments of bronze and terra-cotta. North of the stoa comes the central hall, also of Roman construction, and so arranged that its south side is formed by part of the north wall of the stoa, from which no doubt it was entered direct. This hall was probably covered by a roof, and had a double line of columns, as in the great stoa on the Acropolis at Athens between the two theatres. But the walls as they stand are very imperfect. Both this hall and the stoa were of the Doric order, and some architectural fragments were recovered. The hall is of much smaller dimensions than the stoa, and seems on the north side to have

opened into a great court without roof. Here, probably, and in the hall stood many of the dedicatory bronze statues of which the bases were found buried in a large pit. The whole of the space east of the hall and court was occupied by a series of chambers of considerably earlier date, with walls much more regularly built of carefully-prepared stones of moderate size, generally laid without mortar. Owing to the curious angle at which the Romans set the south stoa to the earlier buildings, the southernmost chamber is of an irregular form. The central chamber is the most perfect. All the walls are of early date, though the south wall has been partly rebuilt in Roman times. Remains of a late stone floor are interesting as giving the probable floor level. Under it, besides fragments of a Cypriote and other tablets, were found a very fine bronze gilt pin and a crystal cylinder belonging to a sceptre. In default of direct evidence as to the position of doorways, the difference of floor level shows that there can have been no access to this chamber on the north side. The main entrance was probably on the east. North of the central chamber is a broad passage or chamber, with no wall to east or west. This may have formed a great entrance for special occasions, and might thus be identified with the central feature represented on the Cypriote coins as giving a view from the open court. Two large bases for piers actually exist at the east end of the passage where piers occur on the coins. The west end was probably open. The chambers north and south correspond to the lower buildings on the coin with the courtyard extending in front of them. These chambers were probably connected with the administration of the temple, or formed residences for the priests. Finally, along the north side of the open court, and overlapping part of the chambers, is the north stoa, of smaller dimensions than the south stoa, and with no columns in it. The floor is of mosaic, but much coarser than that in the south stoa. The walls are partly Roman, partly of earlier date. Outside this stoa, which apparently formed the north boundary of the temple site, occur detached fragments of walls and small courts of Roman date, belonging, no doubt, to residences or offices for the priests or attendants of the temple.

A brief account must now be given of the antiquities discovered at Kuklia and elsewhere. On the site of the temple itself the most numerous and important finds were the inscriptions, amounting to about 150. Three or four, more or less fragmentary, were in the Cypriote Syllabary. Two marble tablets call for especial mention, one containing a letter from Antiochus to Ptolemy Alexander; the other the list of contributors to the Elaiochristion, doubtless a feast connected with the ceremony of anointing the sacred cone. Another tablet bears an elegiac inscription recording that at the suggestion of King Nikokles the town was fortified; Nikokles conspired with Antigonos against Ptolemy in B.C. 310. But by far the greatest number of inscriptions were on the pedestals of statues dedicated in the temple in Ptolemaic times. The titles, both of the corporate bodies that dedicated them and of the officials in whose honour they were set up, throw much light upon the constitution of Cyprus during that period. Many of these bodies seem to have been military colonies established in the island. The officials usually bear the title *συγγενής του βασιλέως*, with commonly the addition *στρατηγός*. The offices of admiral or high priest are sometimes associated with that of military governor. Several other officials of the Ptolemaic service are mentioned, e.g. *τροφεὺς βασιλέως*, *ἀρχισωματοφύλαξ*, an officer described as of the great library at Alexandria, and a mysterious official called the *ἀρχιδέσποτος*, of whom we hear nothing more. Other antiquities were hardly so numerous as might have been expected, but were still of considerable importance. Naturally, on this site, there were found several rude images of Aphrodite of primitive form, but not a large number of the Cypriote statues and statuettes which have occurred on other temple sites in Cyprus. On the other hand, there have been found some important examples of purely Greek work—a small marble head, of later archaic style, about the beginning of the fifth century; and, above all, a marble head of a boy, about life-size, which may, perhaps, be known in the future as the Eros of Paphos. This is of the finest Greek work and in perfect condition. Various heads and other fragments were found; but perhaps second in importance comes a very richly worked gold hairpin, the top of which is adorned with four goats' heads and above them four doves. The whole is a beautiful specimen of goldsmith's work. The bulk of the tombs examined in the neighbourhood of Paphos had been rifled in ancient times, and even what was left was later than the date of the tombs. The pottery found in the few tombs undisturbed could not be assigned to a remoter period than the seventh or eighth century B.C. With this, however, were sometimes found vases of unmistakable Mycenæ type, seeming to show that the very remote epoch commonly assigned to these vases is to some extent erroneous. In later tombs a considerable number of glass vessels was found, some of them remarkable for their shape or colouring. On the whole, however, Kuklia is not a tomb-site—probably because its ancient fame and wealth have in all periods attracted riflers

who have left but little for the gleaners of to-day. The chief result, then, of the first season's work of the Cyprus Exploration Fund has been the plan of the great Temple of Paphos, built according to Phœnician traditions, and so adding to our most scanty knowledge of the Phœnician temple, as famous in the ancient world and as often mentioned in literature as any known to or built by the Greeks. Since the completion of active work Mr. Hogarth has been engaged in a careful archaeological survey of the island, and his report will help to guide the committee in future operations. In the meantime a site has already been decided upon for next season's work, which is confidently expected to yield a rich harvest of antiquities. The treasurer of the fund (Mr. Walter Leaf, Old Change, E.C.) will be very glad to receive contributions towards the cost of this and future undertakings.

#### EDINBURGH FREE LIBRARY.

ON Monday evening a meeting of the General Committee of the Edinburgh Public Library was held, Lord Provost Clark presiding.

The report of the Building Committee, which was adopted, stated that, on the recommendation of the architect, it was resolved to substitute Carmyllie stone for granolithic for the south-east staircase leading from George IV. Bridge to the Cowgate public entrance; that estimates of the extra cost had been submitted; and that it was agreed to have the work done for 227 $\frac{1}{2}$ l. The report further stated that the committee, having considered Messrs. Beattie & Sons' letter of the 18th inst., along with the report of the clerk of works of the 19th, and the report of the architect that in his opinion the iron contractors were not carrying on the works at such a rate as to insure their completion within the time specified, recommended that the General Committee should recommend the Lord Provost, Magistrates, and Town Council, with the approval of the architect, to give seven days' notice to the contractors, intimating that the committee would take the work out of their hands, and carry it on either by themselves or by other contractors, holding them and their securities liable in all damage and extra expenses arising from the delay or otherwise which had been, or might yet be, incurred.

Mr. Dunlop said that this had had its desired effect, and that matters were now proceeding with more rapidity. Still, they wanted the power craved. They expected to be ready for the roof soon, being already at the last storey of the building. If the contractors for the ironwork kept faith, he thought that by New Year's Day they would have the building covered.

#### ETCHING AND AQUATINT.\*

BY SIDNEY COLVIN.

ETCHING is the name of a variety of metal engraving which has been practised from times little less early than line-engraving. The main point in which it differs from line-engraving is that the lines, instead of being cut with a pointed tool into the surface of the metal plate, are bitten into that surface by the operation of an acid. The meaning of the word "to etch" is thus true to its derivation, which is from a Teutonic root signifying to eat or bite (German *ätsen*, Dutch *etsen*). The material regularly used in etching is copper, but experiments have been made, especially in the early days of the art, with plates also of iron or of zinc. The plate is first covered with a thin hard varnish—or ground, as it is technically called—composed of a mixture of wax, gum mastic, and bitumen, sometimes partly liquefied with oil of lavender. The surface of the grounded plate is next blackened by smoking, and on the ground thus blackened are traced the outlines of the design to be produced. The etcher then takes a straight sharp-pointed instrument or needle, and, holding it like a pen or pencil in drawing, scratches through the ground, to the surface of the plate, first the outlines and then the details and shadows of his design. The copper being thus laid bare in the lines which are to appear as black in the print, the plate is next put into a bath of acid. While the main surface of the plate is still protected by the ground, the acid bites into it wherever it has been exposed by the needle, and produces a sunk line, or network of lines. When the etcher has reason to think the biting has gone far enough for the places which he wishes to print lightest in his work, he removes the plate from the bath, "stops out" those places with wax, so that the acid cannot touch them further, and returns the plate to the bath in order that the lines still exposed may be bitten deeper, and so on until he has obtained the greatest depth which he requires. The ground is then melted off the plate, which is inked and cleaned (but not so

\* From the new "Guide to the Exhibition Galleries of the British Museum."

completely as in line-engraving), and impressions are then taken by means of a press.

This is the method of pure etching, but the name is also extended to include another way of work practised sometimes apart from, but oftenest in connection with, the biting process; the way, that is, of "dry-point." Dry-point consists of drawing or scratching with a needle directly on the surface of the plate, without the intervention of a ground or the use of acid. The lines so produced are rough about the edges, and this roughness is not removed with the scraper, as the roughness of the edges is removed in line-engraving, but left so as to hold the ink and print with the patchy or bloomy effect known as "burr." Many etchers finish certain parts of their work in dry-point, with the express view of obtaining this effect of "burr." Other devices for obtaining depth and softness of shadow are by leaving portions of the plate intentionally uncleaned, or but partly cleaned, so that the plate in these portions prints dark independently of the lines scratched or bitten into it.

The great point of the art of etching is its freedom and directness. The etcher cannot rival the line-engraver in purity, precision, and regularity of curve and hatching; but, subject to this restriction, his method gives him a far wider scope both in the rendering of the facts of life and nature, and in expressing his personal artistic instincts and predilections. From the airiest sketch by which he arrests on copper the momentary dip of a sail or gesture of an arm, to the most brilliant and subtly wrought effects of light and shade, the whole range of artistic suggestion and expression in black and white is open to him. Accordingly the art has been practised mainly, and that by some of the very greatest masters, as one of original design, and only in a secondary degree as one for interpreting the works of others.

*Aquatint.*—The practice of etching, together with the success of the mezzotint engravers, caused some artists in the eighteenth century to consider whether they could not devise a way of using acid to bite in broad tints and washes, instead of only lines, or lines with the burr attaching to them, as heretofore. Several more or less successful experiments in this direction were made in France, but the perfected method of aquatint seems to have been first worked out in England. The process is briefly as follows:—The plate is first varnished, or grounded, with a solution of resin in spirits of wine, which on evaporation breaks up into a multitude of minute and regular granulations. In the interstices of these the copper is exposed, so that if the plate were submitted in this state to the action of acid, and then inked and an impression taken, it would print of an even, dark grain all over. The business of the artist, therefore, having transferred his design to the surface of the plate thus grounded, is to protect from the action of the acid those parts of it which he does not wish to print dark. This he does by painting on them with a brush dipped in turpentine and lampblack, or turpentine and oxide of bismuth. First he covers up, or as it is called "stops out," with this material the parts of the design which are to remain quite white; which done, he gives the rest of the plate a first biting with acid, of such strength as to corrode the copper sufficiently for the palest shadows of the design. The places where the shadows are to remain thus pale he then stops out as before, and gives the plate a second biting for the next darker shadows, and so on for the next, in a series of successive bitings and stoppings-out, until the deepest darks are reached. The ground is then melted away, and the plate is finished and ready to be printed from.

With reference to the origins of etching, the practice of biting-in designs with acid upon metal is said, probably with truth, to have been practised by the Mediæval armourers, and from them to have been adopted by the goldsmiths, or goldsmith painters, who began in the fifteenth century to engrave plates for the purpose of yielding designs on paper. Impressions both from dry-point and from bitten plates appear in the Low Countries towards the close of the fifteenth century. These first-fruits of the art are not here represented, and this section of our exhibition opens with the work of the great Nürnberg master, whom we have already met as a designer on wood and an engraver in line.

Albrecht Dürer in the course of his career made several experiments in etching, most of them, it is thought, on plates of iron; but none are so successful as these two apparently companion pieces of a *Holy Family with Saints* and a *St. Jerome*. Even of these the plates only yielded very few good impressions; those exhibited are fair, neither very strong nor as weak as they most commonly are. A follower of Dürer, Albrecht Altdorfer of Ratisbon, worked alike as architect, painter, goldsmith, line-engraver, etcher, and designer on wood, and was the first artist in Europe to treat landscape independently for its own sake. He used etching exclusively for landscapes and designs of cups, jugs, &c., for jewellers. An example in each of these two kinds is given, but both are weak in impression. Two other artists of the same country, working during the second quarter of the sixteenth century, and influenced much by Dürer, and yet more by Altdorfer, are Hirschvogel and Lautensack; both understood

the methods of biting better than Altdorfer, and produced work less skilful than his in design, but more effective in appearance, though still mainly conventional and confined to little more than outlines. Hirschvogel is represented by three landscapes and two quaint hunting scenes, Lautensack by a landscape, a Bible scene, and a portrait. At Augsburg during the same period the several members of the family of Hopper were extremely prolific in the production of Bible and emblematical subjects, and used chiefly, probably by reason of its facility, the method of etching, which Daniel Hopper is sometimes erroneously said to have invented; an elaborate example of his work is given. Jost Amman, whose style as a designer on wood we have seen already, was also an etcher: he is represented with a composition of emblematic geography and figures, besides a spirited piece representing a discharge of fireworks at Nürnberg in honour of Maximilian II. So far, our examples have been all by artists of the schools of Nürnberg, Ratisbon, Augsburg, or the adjacent parts of Germany. Passing now to the Low Countries, our first example is furnished by a Fleming who struggled hard to be Italian, Frans Floris, with an ineffective enough piece, adapted probably from an antique sarcophagus relief of Minerva and the giants, and designed to commemorate the victory of Lepanto. More genuine and home-grown phases of Netherlandish art are represented by Cornelis Teunissen, with a Fall of the Tower of Babel quaintly realised according to his Dutch imagination, and the eldest Brueghel ("Peasant Brueghel") with a scene of village sports, entirely in the spirit of his pictures, spiritedly drawn and vigorously bitten on a plate of unusual dimensions.

Passing now to the schools of Italy, we find etching little, if at all, made use of in that country until the middle and later half of the sixteenth century; from which time onwards its facile methods (facile at least to use amiss) proved very tempting to the enervated artistic spirit of the race, and partly superseded, and partly helped to deteriorate, the severer skill of the line-engraver. The *Holy Family*, by Andrea Medolla, is designed in the over-suave spirit of the time, and printed with effects of burr and inking that may probably be accidental. Battista Franco etches a well-known composition of Titian in a manner hardly to be distinguished from that of careless line-engraving; then come two anonymous etchings after the same master, one of a *Virgin and Child with Saints*, another of a landscape with shepherds driving a flock beside a stream: both formerly, but quite wrongly, attributed to Titian himself. The Italian series is here interrupted in order to bring into comparison with this Venetian landscape those etched, in a manner perhaps suggested by similar examples, by the Italianised Fleming Paul Bril and the Dutchman Abraham Bloemart. Following next the influence of the Italian Renaissance into France, we find subjects of saints, with landscape backgrounds, etched by anonymous masters of the Fontainebleau school, and by Etienne du Pérac, with more both of sentiment and vigour than is common about the same time in Italy itself. Witness the examples which follow of the four famous academical masters of Bologna, Lodovico and Annibale Carracci, Guido Reni, and Guercino: all devotional pieces of the slightest kind, and without the degree of academical power and accomplishment which the same masters showed undeniably in their pictures. A much humbler German etcher of the same time, that is the turn of the sixteenth and seventeenth centuries—Bartholomäus Reiter—handles similar subjects with more conviction and expression; and a Neapolitan painter of Spanish origin, Ribera, shows in them a certain real vigour both of ascetic sentiment and of artistic touch.

We have now arrived at the period when men of genius, born about the close of the seventeenth century or in the opening years of the next, arose to give new value and significance to the etcher's art. First among these comes Vandyke, with four examples, in various states, of his famous and brilliant etched portraits of contemporary artists, and two elaborate subject-pieces handled in a manner of less freedom and directness, and more resembling that of a line-engraver who uses etching for the preparatory labour of his plates. Next Claude Lorraine, who in his etched designs of classic landscape and architecture succeeded in expressing, though with a comparatively tentative and uncertain hand, much of the same perfect feeling for the composition and relation of forms and masses, and the gradations of light and shade, as inspired his pictures. A French contemporary of Claude who shared his feeling and imitated his effects, but in a dryer and more academic fashion, was Gabriel Perelle: the sterner view of Roman classic landscape characteristic of Gaspar Poussin is represented next. Among native Italians, the chief etcher in the first half of the seventeenth century was Stefano della Bella, who died young, but not before he had produced a vast number of plates executed with an unsurpassed dexterity and lightness of hand. Airy studies of character and costume, and grotesque or graceful decorative fancies, compose almost the whole of this master's work: while Callot, who had wandered young from Lorraine into Italy, combined with an equal adroitness and vivacity of touch on a minute scale a far greater reality of theme

and grasp of human character and expression. The serious side of Callot's talent is represented by four subjects from the Passion of Christ; the burlesque side by the well-known riotous travesty of a *Temptation of St. Antony*. Only second to the influence of Callot in spreading a taste for etching throughout Europe in the seventeenth century was that of a French artist of a very different temper, Abraham Bosse, who, besides producing a number of careful plates, was the author of a treatise on the technicalities of the art. Directness of effect and expressive freedom of touch were not the chief points of etching as conceived by Bosse: he aimed rather at rivalling the effects of the line-engraver by mechanical regularity of handling and brilliancy of light and shade, so that it is often hard to tell whether or no his plates have been finished with the burin. A similar aim, attended by a similar ambiguity, prevails in much of the multifarious work of Hollar, a Bohemian who settled in England and laboured here during the Commonwealth and Restoration period with inexhaustible faithful industry and scanty reward. Our specimens of Hollar's work include costume and portrait pieces, natural history, and illustrations of poetry and fable. Immediately after them are placed a group of fable and animal subjects by English artists who etched under the influence of Hollar, in a similar precise and graver-like manner, namely, Richard Gaywood, Francis Barlow, and Francis Place. The designs for most of these subjects are furnished by Barlow, who was a prolific though clumsy enough draughtsman.

From this point we go back to take up the history of etching in the Low Countries, where throughout the seventeenth century the art was practised assiduously by many masters, and by one, Rembrandt, with incomparable power. Among Dutch artists of Rembrandt's day but senior to him, Jan Van de Velde handled the needle somewhat dryly, having greater skill as a line engraver, and Antoine Waterloo produced innumerable studies of forest scenery, sometimes, as in the present instances, animated with Scriptural or Classical figures, and technically not ineffective, though wearisome by reason of their conventional monotony of character and design. At this point follow our examples of Rembrandt himself, who exceeded all other etchers in mastery alike of human gesture and expression, and of the forms and features of landscape, and was incomparably skilled in conveying the effect he desired, whether by an economical device of the fewest and most expressive strokes, or by a combination of the richest and most elaborate effects of shading, biting, and printing. His work in Bible illustration, in portraiture, and in landscape is all represented here with good, although not the very rarest or most brilliant, examples. Ferdinand Bol stands alike as a painter and etcher for the group of Rembrandt's immediate pupils and followers in Holland.

Returning now to Italy, we find a popular seventeenth-century painter of animal and Scripture subjects, the Genoese Benedetto Castiglione, influenced as an etcher by the examples of Stefano della Bella and of Rembrandt almost equally. Salvator Rosa follows, with four large Classical and emblematic subjects technically mere outline sketches on the copper, and less characteristic of his powers than his usual pictorial motives of beggar-and-bandit-haunted landscape. The succeeding examples illustrate the various uses of etching by Italian artists of the latter half of the seventeenth century. The spirit of the antiquarian draughtsman is represented by Galestruzzi, with his plate from the bas-relief of the *Apotheosis of Homer* now in the British Museum; that of the facile and fashionable devotional and decorative painter, working experimentally with needle and copper, by Luca Giordano with his *Woman taken in Adultery*; that of the ordinary craftsman in etching and engraving, by Biscaino and Lorenzini.

Then we return again to the fresher inspiration and more spirited handiwork of the Dutchmen; and first of those Dutch pastoral painters whose native instincts were modified during a sojourn in Italy by the influences of Roman scenery and tradition. Of these, both Jan Both and Berchem were prolific and skilful etchers. They are followed here by other Dutch masters who lived at home and escaped the fascinations of the south; Ruysdael, the great master of woodland romance and mystery, whose etchings, however, are tame beside his pictures; and Bakhuyzen, one of the most diligent students of his native shores and seas. Next comes a group of the lovers, both Dutch and Flemish, of homely and grotesque humanity. First Andries Both, who despite his travels in Italy, and even in saintly subjects like these, never lost his rude spirit of caricature; next, the great Antwerp painter of peasant life and tavern humours, Teniers, and then the scarcely less famous Haarlem painter of similar themes, Adriaen van Ostade, with his weaker follower Cornelis Bega. All these masters express themselves by means of the needle and copper-plate with vigour and originality, though none with anything approaching the powers and resources of Rembrandt. A relatively equal measure of skill in etching was attained by two of the purely native pastoral painters of Holland, Paul Potter and Adriaen Van de Velde, who close the series of the famous Netherland

masters of this age. Following them are placed examples of two German artists, J. H. Roos, who worked in the Italian romantic pastoral vein with great applause in the third quarter of the seventeenth century; and Ridinger, who continued through a considerable part of the eighteenth to etch subjects of forest life and sport.

The seventeenth century was pre-eminently (leaving our own generation out of account) the great age of etching. Passing to the eighteenth, we find the art less practised, and that generally in a more trifling, imitative, and amateur fashion. Our next two examples are French, and represent the transition from the one century to the other. Claude Gillot initiates that style of treating Pagan mythologic and decorative themes which we shall find practised later, with an exquisite alertness of fancy and of hand, by Eisen and Fragonard. The many-figured scene of court ceremonial by Pierre Brissart is an example of a widely different use to which etching was frequently turned at this time and afterwards. In Venice the art was deftly practised throughout the greater part of the century by both the elder and younger Tiepolo: the former of whom (Giovanni Battista) etched chiefly trivial Classical or fancy subjects, while the great devotional and decorative paintings with which it was his main business to adorn the churches and palaces of Venice were reproduced on copper by his son Giovanni Domenico, known as Tiepoletto. A versatile and accomplished, but purely imitative and unoriginal German artist, Dietrich, who was technically the most skilful etcher of his time, follows with a Scriptural subject and two landscapes. After the airy outline sketches on copper of Eisen and Fragonard already mentioned, follow the contrasted efforts of a French amateur, Marcenay de Ghuy, to obtain the utmost finish and brilliancy of effect by minute burin-like shading, perhaps actually finished with the burin, and next to these come specimens of portrait work by the Englishman Worlidge, a sedulous copyist and tolerable imitator of Rembrandt. The two great Continental illustrators and vignette designers of the eighteenth century, the Germanised Pole Chodowiecki and the Frenchman J. M. Moreau, follow—the former with two sets of illustrations to Shakespeare, brightly designed on a minute scale: the latter with two etched title-pages and a frontispiece. Then comes Captain William Baillie, skilled alike in mezzotint, stipple and etching, but best known by the liberties he took with Rembrandt's finest plate in its state of ruin; he is here represented by two heads after Salvator Rosa and Frans Hals respectively. The landscape and pastoral work of the time is illustrated next, with pleasant examples by the Swiss-German poet, scholar and artist, Solomon Gessner, and one by the elder George Barret, a good landscape painter, especially in water-colours, according to the broad and generalising manner of that day in England, but possessing no power, as an example shows, over the technical resources of etching.

At this point a new technical method makes its appearance, that namely of aquatint, practised sometimes in combination with and sometimes apart from the ordinary method of etching with incised and bitten lines. First come examples of the imperfectly successful experiments of St. Non and Le Prince, and then of the method as perfected in England by Paul Sandby. Next, some small landscapes in mixed etching and aquatint by the German pastoral painter Kobell. Another German, Balzer, follows with a *Virgin and Child*, treated in the same mixed method and with an unusual depth of biting and force of effect. In France aquatint became very popular among the designers of social types and scenes in the days of the Revolution, the Directoire, and Consulate: foremost among whom was Debucourt. By way of contrast with his scene of festivity in the Café Frascati, is placed a large plate of the Fall of the Bastille, etched in the ordinary manner by Thévenin. Then we pass to the Classic landscape work of the time, as practised at Rome or under Roman influence by artists from the north, in ordinary etching by the German dies, and in aquatint by the Scotchman Richard Cooper. A French etcher of great power, who worked in the regular manner towards the close of the eighteenth century, with a leaning now to the example of Rembrandt and now rather to that of Abraham Bosse, was J.-J. de Boissieu. Next to his work comes a solitary and very rare example of etching from the hand of the great French painter, Ingres; and in the quality of pure and expressive draughtsmanship on copper, without regard to effects of atmosphere and mystery, this portrait is among the very first masterpieces of the art. A very different branch of French taste and practice is illustrated in the clever aquatint by Jazet after Horace Vernet's design of a *Mameluke and his Horse*. The powerful and cynical Spaniard, Goya, comes next with one original plate and one after Velasquez.

Returning now to the home art of England—in the opening decades of this century we find etching practised for the rendering of architecture and landscape by the two chief painters of the Norfolk school, Cotman and Crome, with a characteristic fine feeling for the quality of their subjects, but little technical command over the resources of the art. Work more effective from this point of view was produced about the

same time by inferior men, such as Cuitt and Cave. But it was among artists of the Scotch school alone that etching was in these days practised, especially in figure subjects, with real understanding of its means and vigour of effect. Andrew Geddes equally in portrait and landscape shows himself an apt student both of Rembrandt and of nature; and Wilkie etched subject-pieces forcible alike in character and chiaro-oscuro. In the meantime an obscure drawing-master of Salisbury, D. C. Read, was etching the scenery of his native county with a skill and feeling for the true effects of the art which were hardly equalled by more famous men, and won for him the warm praise of Goethe. The last English etcher represented is Samuel Palmer, the painter, who practised diligently in this medium with the same rare feeling as is shown in his water-colours for Classic and poetic forms of landscape, and for the conflict of stormy darkness and sunset light.

Turning to the work of the foreign schools during the first half of the century, we find the Swiss landscape painter, Calame, making etchings, with no great mastery, from his native scenery, while the Düsseldorf J. W. Schirmer composes forest and lake views with some learning and power, but without the directness and freshness which this art requires. The real great revivers of etching in this century were the French, of whom we first encounter Méryon, the sailor turned artist, whose intense and at last crazed imagination was seconded by a hand of extraordinary power, and whose studies of architecture, especially the architecture of old Paris, are unrivalled. Next follows the still surviving veteran Jacque, who has been for many years of his life a versatile and brilliant etcher, and is here represented by two studies of animals and landscape. By the great painter of peasant life and labour, Millet, are two etchings which show little care for the technical niceties of the art, but express adequately and with directness his extraordinary instinct for the expressive and monumental qualities of grouping and gesture in labouring figures. With a large and powerful storm-landscape by the painter Daubigny the series closes; leaving us on the threshold of that active and fruitful revival of the etcher's art, for the purposes alike of original expression and of the reproduction of pictures, which has taken place during the last thirty years both on the Continent and at home.

#### HOLYROOD ABBEY.

AN article on the abbey of Holyrood, which was founded in 1128 by King David I., appears in the *Scotsman*, from which the following is abstracted:—

At the time of the Reformation its annual revenue consisted of 442 bolls of wheat, 640 bolls of barley, 560 bolls of oats, 500 capons, 2 dozen hens, 2 dozen of salmon, 12 loads of salt, in addition to a number of swine and a sum of 250*l.* sterling. The canons had extensive jurisdiction in the Canon-gate and vicinity of Edinburgh, and erected mills upon the Water of Leith (which still bear the name of Canonmills), in North Leith and other quarters. The ecclesiastical annals of the abbey, like the charter of the city of Edinburgh, are extremely meagre. From King James VI. to James VII. the building was occupied as a parish church by the inhabitants of Canon-gate, who appear to have used the ground to the east as a burial-ground. Within the walls of the abbey itself were placed the remains of distinguished individuals, as well as those of Royal blood. For twenty years during the successive reigns of James VI. and his son Charles, the English liturgy was read in the church, but the very strong antipathy which the people then entertained to Episcopalian forms led to a change. In 1659 the Marquis of Hamilton, at that time Royal Commissioner of Holyrood House, had an intimation sent him from the citizens that if he continued to make the attempt to have the liturgy read, the officiating clergyman would be assuredly murdered. The marquis abandoned the idea of having it read. It is right to state in this connection that prior to 1633, Edinburgh had been created a bishopric by King Charles I. He annexed to the new see the church or abbey of Holyrood House, and appointed its minister to be one of the prebendaries of St. Giles's. The charter granted by him was ratified by King Charles II. King James VII.—who, as Duke of York, had for a considerable time his abode within the palace—conceived the idea of converting the church into a chapel royal, and providing it with a throne for the Sovereign, and stalls for the Knights Companions of the Order of the Thistle. In 1687, on his order, the magistrates of Edinburgh delivered up the keys to the Lord Chancellor, the Earl of Perth, and great improvements were effected on the internal appearance of the building. The church was provided with a mosaic floor of marble, a throne was erected, and stalls were provided; while a splendid organ, beautifully decorated with armorial and artistic devices, served the purpose for which it was designed by its royal projector. But when the populace became aware that High Mass was performed therein, their fury knew no bounds; they overpowered the military guard,

tore to shreds the costly ornaments, set fire to everything that was of an inflammable nature, and left nothing behind but the bare walls. Not content with wrecking the abbey, their mad infuriated zeal caused them to commit further atrocities in tearing open even the coffins of David II., James II., James V. and his second son, and of King Henry (Lord Darnley). The abbey, so destroyed at the time, remains a wreck at the present day. No great use has been made of it since the Revolution, except as a burial-place for the illustrious dead of Scotland. The last one of the Scottish nobility who found his grave there was the recently deceased Earl of Caithness. The building, however, still continues as a chapel royal.

The abbey at one time consisted of cloisters, dormitory, refectory and other comfortable adjuncts; only the nave, which appears to have been the western part of the conventual church, appears to have survived the Earl of Hertford's hostile irruption in 1544, to which future reference will be made. It seems to have been the nave of the original edifice which James VII. repaired and converted into the chapel royal. It would not be surprising if the original abbey covered nearly all the ground upon which the Palace of Holyrood now stands, as well as the grounds afterwards known and appreciated in sanctuary times as St. Ann's Yards, which it is believed were originally a place of sepulture in connection with the abbey. The conventual church was originally on the north side of the abbey. It was of a crucifix form. There are still some remains of the transept, which formed the north and south ends. In the line of the transept was a square lantern tower, which rested on four large pillars with lofty connecting arches. The centre and side aisles of the nave were divided by a row of nine clustered piers on both sides, supporting eight equilateral pointed arches. The gallery was over the side aisles. The roof was of vaulted construction, similar to ancient Gothic ecclesiastical edifices. The buttresses and canopied niches and pinnacles were in exquisite taste, and some of these are still in admirable preservation; but many of them have been destroyed in consequence of the somewhat coarse usage which the stupid and misdirected zeal of the mob brought to bear upon them. So far back as 1332 the gold and silver vessels of the abbey were despoiled. The English soldiers of the period manifested too plainly an eager desire to plunder and destroy the ecclesiastical edifices of the time. Three years thereafter the Abbey of Holyrood was burnt to the ground by King Richard II. It has never been ascertained when the abbey was rebuilt after having been burnt down, but it was embellished and made available for useful purposes by the Abbot Crawford, Lord High Treasurer of the kingdom, who died in 1483. In April 1544 the Earl of Hertford invaded Edinburgh, when the Abbey and Palace of Holyrood were almost reduced to ashes. The choir, transept, and lantern tower were destroyed, and only the nave was left. A brazen font, of rare value, from which the royal infants were usually baptized, was borne away by Sir Richard Lea, captain of the English Pioneers, who presented it to the church of St. Albans.

After the battle of Pinkie in 1547, Protector Somerset, fired with an intense hatred of Catholicism, sent two of his generals to pillage the abbey. The monks, however, had fled with their valuable treasures, and so the invaders for the time being had to content themselves with stripping the lead off the roofs of the church and palace, taking down the bells, &c. Twenty years thereafter, viz., on June 18, 1567, only two days after Queen Mary's first imprisonment, Lord Glencairn was instructed by the governing party in the nation to destroy the abbey. This he did most thoroughly by ridding it of what was regarded as the monuments of idolatry, because he utterly destroyed its altars, pictures, and statues. In a very ruinous condition did the edifice remain, although it was utilised for church purposes, until the year 1633, when it would appear, from an inscription above the west door, that during the reign of Charles I. important repairs were effected. It was probably at that time that the large window to the east, which bears traces of being somewhat modern, was built. In 1758, the state of the chapel royal having been brought under the attention of the Barons of Exchequer—a Scottish Court now for a long period obsolete—their lordships contracted with a tradesman to have the chapel re-roofed. The contracting party, instead of supplying a slate roof, provided it with a flag roof, which proving too heavy for the walls, the enormous load fell in the winter of 1768, bringing away with it not only the roof, but also the upper stone gallery.

In 1795, the mullions and tracery of the east window having become loose through the force of a severe storm, the window fell to the ground. This was afterwards repaired by the Barons of Exchequer in 1816, and other improvements were effected to prevent its dilapidation.

When George IV. visited Edinburgh in 1822, it was thought desirable to bring under his attention the miserable condition of this venerable edifice. The King directed the complete renovation of both the palace and the abbey. To accomplish this object the sum of 4,000*l.* yearly was, for a

period of six years, appropriated out of the Crown revenues of Scotland. The palace of Holyrood House has been restored; but the abbey stands now as it did then—fit companion for either Abbotsford or Melrose, or the ruin of Linlithgow Palace, which Lord Rosebery recently designated "the Windsor of Scotland."

### CHURCH BUILDING AND RESTORATION.

**Epworth.**—The memorial-stones of the Wesley Memorial Chapel at Epworth have been laid. The memorial will be disposed in the form of a quadrangle, with chapel, schools and proposed manse on three sides, and a marble statue of John Wesley in the centre. The chapel and schools will be in the Early English-Gothic style, built of brick, with Shipley stone facings and Ancaster stone dressings, and will seat about 400 in the body and fifty in an end gallery, which is reached by a staircase in the tower. The latter, with a spire, will be erected to a height of 80 feet. There are two aisles, with a couple of shallow transepts, organ chamber and chancel. The school has a separate entrance from the quadrangle and consists of a large room, well lighted, with accommodation for 200 persons, together with classrooms, &c. The contract price for the work is 2,742*l.* Mr. Charles Bell, F.R.I.B.A., is the architect, and Mr. H. Kelsey, of Epworth, the builder.

**Leytonstone.**—In April last plans for the Wesleyan Methodist schools and chapel extension were invited in competition from six architects, and on the advice of the referee those submitted by Mr. George Baines, 4 Great Winchester Street, E.C., were selected. Since this decision the committee have purchased an adjoining house, and propose to carry out a much larger and more comprehensive scheme in sections, from the designs of the above-mentioned architect. Tenders for the main schoolroom and chapel extension have been accepted, the work to commence on the site, March 1 next.

### SCHOOL BUILDINGS.

**Beith.**—The Spier school, erected about half a mile from Beith, has been formally opened, having been built and endowed from funds left by the late Mr. Spier, of Marshalland, as a secondary or higher grade school established under the scheme of the Scottish Endowment Commissioners. Mr. Sellars, of Glasgow, the architect, has in the design, while adapting it for its special purpose, reproduced some of the features (particularly in the tower and the large gable in front) of the ancient College of Glasgow. In the north end of the buildings are situated a series of four classrooms, which will accommodate about ninety girls. The most prominent feature in the elevation is the tower, which rises to a height of 105 feet. The main entrance is through the lower part of this tower, which forms a vestibule about 12 feet square, and here is erected one of the marble tablets belonging to the Trust. The classrooms for boys are six in number, and will accommodate about 180. Three of these rooms are on the ground floor, and three in the second floor, and all are well lighted and ventilated. On the first floor is a large apartment called the common hall, where all the pupils can assemble on occasion; and entering from this hall is an apartment, formed in the tower, which is named the monument-room, and which is intended for the reception of some memorial busts of the Spier family. The heating is by hot-water pipes. There is also a house for the head-master, and accommodation for boarders is afforded here. The cost of the building, including laying-out of grounds, is estimated at 12,000*l.*

**Lanark.**—The grammar school has been reopened, after being enlarged and remodelled. Originally it was constructed for nearly 400 pupils. It is now capable of taking in 549. The plans of the restoration were prepared by Mr. Murray, of Heavyside, and the tradesmen all belonged to Lanark. The total cost of the work is about 2,200*l.*

### GENERAL.

**Mr. H. D. Appleton, F.R.I.B.A.,** president of the Architectural Association, is to deliver an address on "The Affiliation of Architectural Student Societies" to the members of the Birmingham Architectural Association on November 20.

**A Portrait,** painted by the late Mr. Frank Holl, R.A., was presented to Lord Brassey, on Wednesday, at Normanhurst Court.

**Competitive Designs** are sought by the Edinburgh Town Council for the proposed statues of Wallace and Bruce, to be erected in Princes' Street Gardens.

**A Fragment** of masonry on Tuesday fell from the top of the Monument. An examination is to be made, and meanwhile it is stated that iron girdwork filled with sand will be placed round the column to intercept any of the stonework in case it falls.

**Memorial Stained-glass Windows** of the late Mr. John Pearson and Mr. Thomas Knowles are proposed to be placed in the church of St. Mary, Ince-in-Makerfield.

**Mrs. Andrew Carnegie** has given 900*l.* to the building fund of the free library at Grangemouth, N.B., the foundation-stone of which Lord Zetland has undertaken to lay on the 1st prox.

**The Artists' Rifle Corps** have received sanction from the War Office to remove their headquarters to the spacious building erected by the corps in Duke's Road, St. Pancras.

**The Walsall Science and Art Institute,** erected from the designs of Messrs. Dunn & Hipkiss, of Birmingham, was opened on Monday by Sir Charles Forster, M.P.

**An Ornamental Lake** for boating purposes is proposed to be constructed at Dundee, by extending the Esplanade wall so as to enclose an area of 37 acres. It is stated that it can be made without great cost, and would have 6 feet of water at low tides and 12 feet at spring tides. A committee has been appointed to report on the scheme by the Police Commissioners.

**A Faculty** was granted on Tuesday in the Liverpool Consistory Court to pull down the old church of St. Anne, Stanley, and rebuild it on an enlarged site. The cost will be defrayed by Mr. T. F. Harrison, shipowner, of Liverpool.

**The Finance Committee** of the Liverpool Corporation have made a recommendation to advertise that premiums of 100*l.* and 50*l.* respectively will be offered for designs and plans for erecting shops and other business premises upon the land situate at the corner of Church Street and Parker Street.

**At a Meeting** held in Grantham last week it was decided to erect a drinking fountain, surmounted by a statue, to the memory of the late Hon. F. J. Tollemache, of Ham House, Petersham, Surrey, from a design by Mr. Charles William Smith, architect, of Buckminster, Grantham.

**The Ecclesiastical Commissioners** have approved of plans for the erection of a church containing about 600 sittings and to cost 4,000*l.*, upwards of 2,000*l.* of which has already been obtained, for the Newtown and Marsh Green districts of the parish of Pemberton, near Wigan.

**A Meeting** of inhabitants was held on Monday, in Poplar, at which it was resolved to urge upon the Metropolitan Board of Works, and, if necessary, upon the Home Secretary, the importance of proceeding without delay with the construction of the Thames Tunnel for vehicular traffic.

**The Old Church** at Garston, rebuilt in 1715 by Edwar Norris, has recently been taken down, and from the foundations have been taken carved stones from the older church, showing capitals of pillars, pieces of the shafts, window tracery, jambs and sills, the copings of battlements, cornices, gutters, and gargoyles, also the fragments of what may have been a richly panelled late Gothic mortuary chapel of the Norris family. It is intended to retain some of these fragments, but many of them are being recut to build the boundary wall of the churchyard.

**The Tower** of the parish church at Berkeley, Gloucester, is to be restored, from plans by Mr. B. H. Ransford, surveyor to Lord Fitzhardinge.

**The Norwich Town Council** has favourably received a memorial to take steps to free Carrow Bridge. The existing mortgages amount to 3,459*l.*, and a new bridge, it is stated, will have to be constructed at no distant time.

**At a Public Meeting** held in Aston on Friday last, it was decided to take steps for the building of a hall and recreation-room, the total cost of which is put down at about 3,000*l.*

**A New Chancel,** organ chamber, and vestries are to be added to the church of St. Luke, Darlington, from the designs of Messrs. Clark & Moscrop.

**A Paper** on "Light Railways" will be read by Mr. William Lawford at the meeting of the Society of Engineers on Monday.

**The Fleming Hospital for Sick Children,** erected on the Moor Edge at Newcastle, at the sole cost of Mr. John Fleming, solicitor, of Newcastle, was on Thursday opened by Lord Armstrong, of Craigside.

**The Hospital** erected from the designs of Messrs. Bottle & Olley in Great Yarmouth, at a cost of 10,000*l.*, has been opened.

**The Winsford Local Board** have decided to obtain a portrait, to be placed in the Free Library, as a memorial of the late Mr. Robert Verdin, M.P.

**The Programme** of lectures for the forthcoming session of the Birmingham and Midland Institute has been issued. In the archaeological section, of which Mr. Timmins is president and Mr. J. A. Cossins honorary secretary, papers are to be read by Mr. W. A. Cotton, the Bromsgrove antiquary, on "The Regal Mints of Tamworth, Warwick, and Coventry"; by Major-General Phelps, on "The Cave Architecture of Western India"; and by Mr. T. W. Camm, on "Old Stained Glass." Mr. Matesdorf is to lecture on "The Cartoons of Raphael" and on "The Educational Value of Art."

**CRIMINAL PROCEEDINGS,** under the new Merchandise Act, will be instituted against any person falsely representing any form of ventilator to be a Self-acting Air-pump Ventilator, said title being registered and our Trade-Mark, applicable only to ventilators manufactured by us. Any infringement renders the person infringing liable to two years' imprisonment. ROBERT BOYLE & SON, LD.

A Business Supplement

# The Contract Reporter.

to The Architect.

LONDON, SEPTEMBER 28, 1888.

## CONTRACTS OPEN.

ABERDEEN.—Oct. 1.—For Building Concrete Engine Seat at Cults Steam Pumping Station. Mr. W. Boulton, Burgh Surveyor, Town House, Aberdeen.

ABERDEEN.—Oct. 2.—For Building Workmen's Cottages at Culter Paper Mills. Messrs. Jenkins & Marr, Architects, 16 Bridge Street, Aberdeen.

ALTOFTS.—Oct. 1.—For Building Detached Residence. Mr. G. H. France, Architect, 8 Barstow Square, Wakefield.

ANCOATS.—Oct. 3.—For Building Police Station. The City Surveyor, Town Hall, Manchester.

BLAENAVON.—Oct. 3.—For Additions to Endowed Schools. Mr. E. A. Lansdowne, Architect, 25 High Street, Newport, Mon.

BOURNEMOUTH.—Oct. 4.—For Wrought-iron Unclimbable Fencing with Gates, &c. Mr. G. R. Andrews, Surveyor, Town Hall Chambers, Bournemouth.

BRADFORD.—Oct. 9.—For Building Shops and Business Premises, Kirkgate. Messrs. Empsall & Clarkson, Architects, 55 Tyrrel Street, Bradford.

BRENTFORD.—Oct. 2.—For 9-inch Brick Wall (230 feet), with Coping and Railing. Mr. Lacey, Surveyor, Clifden House, Boston Road, Brentford.

CANTERBURY.—Oct. 2.—For Reparation of Butter Market. The City Surveyor, 8 Watling Street, Canterbury.

EAST HALTON.—For Building Wesleyan Chapel, School-room, &c. Mr. Richard Coulson, Architect, 5 Bishop Lane, Hull.

EXETER.—Oct. 2.—For Building Two Dwelling-houses. Messrs. Packham, Croote & Stuart, Architects, 93 Paris Street, Exeter.

FERNDALE.—For Building Five Houses. Mr. Thomas Thomas, Dolywern Cottage, Ferndale, Wales.

GRANTON.—For Providing and Laying Cast-iron Pipes, &c. Messrs. Niven & Haddin, C.E., 131 West Regent Street, Glasgow.

GUILDFORD.—Oct. 10.—For Building Cookery Classrooms to Two of the Board Schools. Mr. W. G. Lower, Architect, 12A High Street, Guildford.

HEREFORD.—For Building Eye and Ear Hospital. Mr. E. H. Lingen Barker, Architect, 146 St. Owen Street, Hereford.

HINCKLEY.—Oct. 4.—For Cast-iron Socket Pipes (13½ miles). Messrs. T. & C. Hawkesley, C.E., 30 Great George Street, Westminster.

H.M. OFFICE OF WORKS.—For Repairs, &c., during three years to Buildings, Chester, Preston, Warrington, Leeds, and Hull. Mr. W. H. Primrose, Secretary, 12 Whitehall Place, S.W.

HORNSEY.—Oct. 8.—For Supply of Rolled Iron Joists. Mr. T. de Courcy Meade, Surveyor, Southwood Lane, Highgate, N.

HOYLAND NETHER.—Oct. 1.—For Building Police Station. Mr. J. Vickers Edwards, West Riding Surveyor, Wakefield.

KILBURN.—For Completing Houses. Mr. William Eve, Architect, 10 Union Court, E.C.

KILLARNEY.—Sept. 29.—For Restoration of Protestant Church, Building Organ, and Heating Chambers. Mr. J. F. Fuller, Architect, 179 Great Brunswick Street, Dublin.

LEYTONSTONE.—Oct. 2.—For Repairs, &c., to School. Messrs. A. & C. Harston, Architects.

PENMAENMAWR.—Oct. 6.—For Rebuilding Parish Church of Dwygyfylchi. Mr. E. M. B. Vaughan, Architect, Cardiff.

SANDOWN.—Oct. 4.—For Construction of Sea Wall and Esplanade. Mr. J. Newman, Engineer to the Local Board, Sandown, Isle of Wight.

SOUTHALL.—Oct. 1.—For Underground Rain-water Tank (50,000 gallons). Mr. J. Bedford, Guardians' Offices, Northumberland Street, W.

SOUTHEND-ON-SEA.—For Building Five Shops and Houses. Mr. E. Wright, Architect, High Street, Southend.

SUTTON.—Oct. 3.—For Boundary Walls, Gate, Lodge, &c., St. Finton's Graveyard. Mr. T. H. Atkinson, Clerk to the North Dublin Guardians, North Brunswick Street, Dublin.

WANDSWORTH.—Oct. 3.—For Repairs to Infirmary. Mr. E. H. Taylor, Union Offices, New Wandsworth.

WINDSOR.—Oct. 4.—For Sludge-pressing Room and Sludge Store Tank at Sewage Works. Mr. T. V. Davison, Borough Surveyor.

YORK.—Oct. 9.—For Building Mortuary at Fever Hospital. Mr. E. G. Mawbey, City Surveyor.

## CONTRACTORS TO H.M. GOVERNMENT.

INTERNATIONAL HEALTH AND OTHER EXHIBITIONS—MEDALS AWARDED FOR

## LEGGOTT'S PATENT ADJUSTMENT

CONTINUOUS OPENER.

SILENS.

THE SILENS, for Fanlights, Skylights, &c. Is admitted to be the best ever put before the Public. Can be adapted to any kind of window. Size and height of window no object.

From 4/3 each.

The WILMOS is worked with a rod or endless cord. It is extremely neat, and can be fixed to open either top or bottom, inwards or outwards; no cutting away of frame required. When worked with a rod is most efficient for Public Buildings, as the key can be loose. For Price Lists, Illustrations, and Testimonials, write as below.

For Continuous and other Lights, Estimates given.

WILMOS.

NO CUTTING AWAY OF FRAME REQUIRED.

## TESTIMONIAL.

SIRS,—I have pleasure in testifying that I have used Leggott's Silens Adjustments for various buildings to high skylights, fanlights, and top parts of windows, and in every case they gave satisfaction.

They are secure in whatever position, whether the window is open or closed, and are quite simple and workable in their action. I prefer them to any other that I have seen or used for the above-mentioned purposes.

Messrs. W. & R. LEGGOTT, Bradford.

I remain, yours obediently,

R. DAVIES, Architect.

BANGOR: N. Wales: Sept. 14, 1885.

Considerably Reduced Price List, November 1, 1887.

ALL WORK ENTRUSTED TO US GUARANTEED SATISFACTORY.

TRADE NOTES.

MR. E. H. SHORLAND, of Manchester and London, has just supplied his patent Manchester grates and stoves to the new Catholic schools, Normanton, Mr. E. Simpson, of Bradford, being the architect.

IT is proposed to construct an open swimming-bath, about 90 feet long and 60 feet wide, in the Ivy House Recreation Ground, Leeds.

MR. FENWICK, C.E., of Leeds, the arbitrator in cases of land taken by the Halifax High-level Railway Company, has awarded 1,738*l.* to Messrs. Henry and Walter Holroyd Oates, the amount claimed being 3,500*l.*; and 1,018*l.* to Mr. Henry Oates, whose claim was 1,350*l.*

A MEETING of the Midland Iron and Steel Wages Board was held in Birmingham on Monday, when it was resolved to re-establish the sliding scale on the basis of the inclusion of all classes of iron, except charcoal-iron, according to the prices ascertained from the books of twelve mutually-selected firms instead of on the price of bar iron only, as formerly. The question of an advance of wages asked for by the operatives, it was decided should be submitted to arbitration.

THE *Halifax Courier* says that since the beginning of 1886, the Sowerby Bridge Local Board have passed 139 plans of houses, all of which have been erected, or are rapidly progressing toward completion. Several were in blocks of from four or five to twice that number, and in three instances the lots exceeded a score, and the rate of increase is being maintained; arrangements are being made for commencing another block of twenty-one in the upper part of Tuel Lane, in which direction extension has been marked of late years. At

OLDHAM.

Sowerby New Road, also, masons, joiners, and plasterers have long been busily employed, and the erection of a further block of six dwellings will shortly be entered upon there. These works are all the result of private speculation and individual enterprise, apart from the operations of the local building companies, who own a good deal of land for future development.

THE Leith Town Council, at a special meeting last week, approved of the Water of Leith Drainage Scheme adopted by the joint committee of the Corporations of Edinburgh and Leith. The cost of carrying out the scheme is estimated at about 65,000/.

ON Friday last the Stratford-on-Avon Rural Sanitary Authority decided to call in Mr. E. Willcox, C.E., of Colmore Row, Birmingham, to report on the means of obtaining an adequate water supply for Kineton.

AT the fortnightly meeting of the East Cowes Local Board a letter was read from Mr. J. Meader, of West Cowes, stating he was at a loss for a reason for their not accepting his tender for constructing the sewers at Adelaide Grove, and the outfall, his being the lowest tender, and, as he was a large ratepayer in the town, he thought it was very unfair. The business of the meeting was then proceeded with.

AN important public scheme was initiated on Friday in Bilbao, to construct an outside harbour, or secondary port, at the entrance of the river Nervion, to be known as the port of Abra. The effect will be to supersede the existing dangerous entrance to the river, an open bar, which, especially with north-west winds, renders Bilbao one of the most dangerous and difficult ports on the Atlantic coast. The principal breakwater or mole is to start from the coast to the north-west of the small fishing village of Santurce, extending 1,000 metres across the bay towards Al Gorta, from which point it takes a southerly direction towards the entrance of the Bilbao river, extending about 500 metres in this direction. On the opposite coast a second breakwater, starting south of Al Gorta, extends in a westerly direction, 750 metres towards the first, but some 500 metres nearer the mouth of the river, the space between the two piers being 640 metres for the passage of vessels. The works are from the designs of the Spanish engineer Churrua; but these appear practically not dissimilar from those proposed some fifteen years ago by the English engineers, Sir John Cooke and Mr. Vignoles. The estimated cost of the works is thirty millions of pesetas, and they are to be completed in twelve years.

The Chertsey Rural Sanitary Board have adopted a report from the Weybridge Drainage Committee, recommending a system of drainage for Weybridge and Oatlands, to be carried out by Mr. R. P. Birch, C.E., at a cost of 15,000/.

THROUGH the liberality of an influential member of the Old Meeting Church, Birmingham, an important addition has been made to the interior of the building by the erection of a handsome oak reredos and side wings. The centre portion, or reredos proper, is divided into five panels by buttresses of a bold character, terminating above the structure in crocketed pinnacles. The panels thus formed are filled by recessed and moulded arches, with gables above supported by columns with carved caps, the space between the arches and gables being filled with carved spandrels and tracery. Three of the panels are further enriched by having the background gilded and illuminated with suitable texts, the smaller panels between being filled by a carved scroll cut in very high relief. The side wings, which run to the north and south walls of chancel, form an arcading with traceried panels, being finished along the top by a carved and moulded capping. The work has been carried out in a thoroughly artistic manner by Messrs. Jones & Willis, of Birmingham and London.

THE contract for the extension of the Ardwick and Ancoats Hospital has been let to Messrs. Neill, of Manchester. The cost of the new wing will be between 11,000/ and 12,000/.

A LARGE turret-clock, with Westminster chimes and four automaton figures, with fine bells, has been erected at the American Markets, Cardiff. It is a first-class clock, and was made at the works of Messrs. William Potts & Sons, clock manufacturers, Guildford and Cookridge Streets, Leeds, from the designs and plans of Lord Grimthorpe (formerly Sir E. Beckett, Bart., Q.C.), all whose latest improvements have been inserted, namely, the double three-legged gravity escapement, maintaining power, compensation pendulum, horizontal cast-iron bed frame planed perfectly flat, and all the bearings being of gun metal, screwed into the frame; the time is shown on a large external dial, with the hands, figures, and minutes gilt. The figures, which are life-size, represent an incident in Sir Walter Scott's "Ivanhoe." The centre figures represent Friar Tuck and Richard Cœur-de-Lion, who strike the hours alternately. The quarters are struck by Robin Hood and Gurth, the swineherd, at whose feet is a boar; there are four bells for the Westminster quarters, and one large bell in the centre for hours. The clocks, bells, and figures will no doubt

form a great source of attraction in the town, as well as being a very useful ornament. The clocks at the Imperial Arcade, Birmingham, and Thornton's Arcade, Leeds, were made and fixed by the same firm. Mr. Richards, of Cardiff, is the architect for the markets.

At a meeting of the Barnsley Town Council on Tuesday there was laid before the Council the draft of an additional agreement with Mrs. Lambert, who had already promised by agreement to give 3,500*l.* for the erection of a hospital, by which that lady promises to give an additional 1,500*l.*, making a total of 5,000*l.*, which she has given for the erection of a fever hospital in Barnsley. The Corporation are to provide a site for the proposed hospital within six months, or the agreements lapse. It was stated that an arrangement to purchase the site had already been made, and only the consent of the Ecclesiastical Commissioners to the sale was needed to complete the transaction. A special meeting of the Corporation will be held, if necessary, to consider the plans for the proposed hospital, which will be built on land at present belonging to the rector of Darfield, at Measborough Dyke.

CONSIDERABLE additions have been made to the Eastern Counties Asylum, Colchester, the ventilation of which is carried out on the Boyle system, the vitiated air being extracted by the latest improved form of the self-acting air-pump ventilator.

THE Perth Town Council on Monday decided to claim 2,000*l.* from the Gas Commission for 1½ acres of ground at the Shore, to be given to the latter in connection with the erection of a new gas-meter, and for wayleave through the South Inch.

At the meeting of the Commissioners of Sewers on Tuesday at the Guildhall, a letter was read from the city architect stating that the whole of the property on the east side of Duke Street, Aldgate, had been rebuilt to the new line of frontage, and that the Commissioners might therefore take possession of the ground between the old and new line of frontage for the purpose of widening and repairing it. Relative to the suggested provision of a subway at the crossing of Queen Victoria Street, in front of the Mansion House railway station, the Streets Committee reported that the Commission had no power to make it, but would assist the railway company to obtain Parliamentary power for the purpose.

THE sixty-sixth session of the Birkbeck Literary and Scientific Institution will open on Monday next. Nearly two hundred classes meet weekly in commercial and technical subjects, mathematics, natural, applied, and mental science,

languages, history, literature, art, music, law, &c., &c. Special classes are arranged for university, Civil Service, and other examinations. The classes are open to both sexes. During the past session the students have gained great success at various competitions, and the prizes obtained will be distributed by H.R.H. the Duchess of Albany, in November next. On Wednesday evenings the usual lectures will be delivered in the large theatre of the institution. Amongst those who are already engaged may be mentioned Sir Robert S. Ball, Mr. Harry Furniss, Mr. Samuel Brandram, Mr. Max O'Rell, Mr. Charles Dickens, Professor Morley, Mr. J. T. Carrodus, Mr. Fred Villiers, and Mr. John Thomas.

A PLOT of ground at Folkestone, which the Government proposed to sell for 700*l.* for a Jubilee hospital site, was sold by auction for 3,425*l.* on Tuesday.

WE have received a copy of the first volume of the new series of the *Electrical Engineer*. This publication is invaluable to all interested in electrical engineering, by its record of the steps that are continually being made in the practical application of electricity as a servant-of-all-work in so many directions. It will, moreover, prove most useful in the library for reference as a history of the progress and practice of electric science. In addition, it contains excellent engravings and portraits of notable men.

COAL has been found at Cotwall End, between Sedgley and Himley, and already shafts are being sunk. The borings, it is stated, prove the coal to be of excellent quality, and likely to be of the ordinary thickness of the South Staffordshire seam, viz., 10-yard thick coal.

The Bristol Docks Board have just completed building an enormous granary on Canon's Marsh. The building will accommodate over 60,000 quarters of wheat, and its construction, together with the machinery, has entailed an expenditure of just 60,000*l.* The machinery is of an elaborate character, and when worked at its utmost capacity is capable of receiving and delivering about 300 tons per hour. There are four elevators capable of lifting 75 tons per hour, and the four can be worked at the same time.

THE freehold land and buildings at Soho, Birmingham, known as the Woodford Ironworks, lately in the occupation of Messrs. Morewood & Co., with the roofing and nail-sheet plant with which they were not many years ago fitted up, and which was advertised as being able to turn out 250 tons of sheets weekly, have been disposed of by auction for 23,500*l.* It

## BEAN'S PATENT DIRECT-ACTING VALVELESS WASTE-PREVENTING CISTERNS.

These Waste-Preventers are simple in construction and rapid and powerful in action. The working parts have been improved and are well balanced. The arrangements for charging the siphon are such that a slight pull by hand is all that is necessary to cause the immediate and automatic discharge of the contents of the Cistern.

THE CHIEF ADVANTAGES are—(1) the direct-acting method of charging the siphon, by which the full flush is obtained at once; (2) simplicity of construction; (3) no valve in the bottom of the cistern to cause leakage; (4) no tight-fitting parts to corrode or get out of order; (5) no waste incurred by fastening the "pull"; (6) insures a rapid and regulated flush without holding down the pull.

SOLE MAKERS—

PRICES AND PARTICULARS ON APPLICATION.

## J. TYLOR & SONS.

SANITARY AND HYDRAULIC ENGINEERS AND BRASSFOUNDERS,  
2 NEWGATE STREET, LONDON, E.C.

includes three pairs of 120-horse horizontal condensing engines by Davy Bros. & Withinshaw, five small engines, six pumps, sixteen boilers, four patent economisers, one 22-inch forge-train, seven 22-inch sheet-mills, two three-ton shingling hammers, thirteen pairs of powerful steam-bar, cropping and sheet shears, weighing-machines, overhead traveller, eight gas-producing puddling furnaces, three ball-furnaces, ten heating and gas-producing furnaces, nine annealing-furnaces. The building embraces a sheet-warehouse, a lathe-shop and dynamo-house, a range of smiths' and millwrights' shops, a fitting-shop, a foundry and the necessary offices and other stores. The land is 6 acres in extent. The works were purchased for the purpose of selling them again in lots.

A SUM of 250*l.* is to be spent on improving the bells of the old thirteenth-century parish church of Wilmslow.

THE *Tyldesley Chronicle* says:—Mr. and Mrs. John Grundy of Tyldesley, had again their "family party" of the old folks of Tyldesley on Wednesday evening, when the proceedings passed off as pleasantly and happily as usual on these interesting occasions. Like the township of Tyldesley itself, the "family" seems to increase in number or size each succeeding year, as there were over 600 who were on this occasion the recipients of Mr. Grundy's bounty. Mr. Caleb Wright occupied the chair, and his appropriate opening remarks gave the key to the speeches which followed, the burden of which was the progress—material and moral—which had been made "since we were boys together."

At the meeting of the Court of Common Council last Friday the contract was sealed between the Corporation and Mr. W. Webster, for the construction of the southern approach to the Tower Bridge for 38,383*l.*

AN artesian tube-well is at present being bored adjoining the new reservoir at Ealing, by Messrs. Le Grand & Sutcliff, hydraulic engineers, London. After passing through 249 feet of London clay and 72 feet of Woolwich and Reading beds, chalk has just been struck at 321 feet below surface. The total depth at present penetrated is 350 feet, and already there are indications of a supply, as the water has risen up 265 feet, or to within 55 feet of the surface.

THE dedication of a new reredos in terra-cotta, the gift of Sir Henry Doulton, will take place at the parish church of St Mary, adjoining the Archbishop's Palace, Lambeth, in conjunction with the Harvest Festival to-day. The design of the reredos is by Mr. J. Oldrid Scott.

#### A NEW DEPARTURE.

ARCHITECTS will readily admit the difficulties experienced in specifying the various materials and fittings used in building, amongst which may be mentioned the trouble in getting designs and ideas followed by manufacturers scattered all over the country; the delay in consequence, and, most important of all, the difficulty of inspection before a final specification is made. It would be a decided improvement if the architect could find a dépôt containing the specialties of the principal firms and the most modern inventions, at the manufacturers' own prices; in other words, an agency in which, directly, manufacturers would be represented.

The convenience of such a system in saving time and expense would be inestimable. The practical application of this idea originated with Messrs. S. Dixon & Son, of Leeds. The firm have had for some years the special agency for Yorkshire from the Wenham Co., Limited, and in consequence no part of the country is more thoroughly lighted. The necessity of providing showrooms for the Wenham Lamp, apart from their works, caused Messrs. S. Dixon & Son to think of extending the idea to include specialties used in every description of domestic fittings. Hence they acquired a whole block of buildings in Boar Lane, the principal commercial street in Leeds, with a splendid frontage. It is certain that no building for prominence and suitability could be found to excel it; and as to the stock within, there is not one more varied or choice to be found in the country. Messrs. S. Dixon & Son have adopted a wise plan in placing in their showrooms the very best goods that can be purchased, instead of confining themselves to individual firms. Their display of lamps, gas fittings, and chandeliers, for instance, is on this principle, for there are in this class several firms of the highest excellence, viz., Hinks & Sons, Defries & Sons, R. Winfield & Co., Hunt & Co., Messenger & Sons, R. Evered & Co., and Moore & Co., so that no visitor can fail to be suited or to have the benefit of comparison.

The wrought-iron work, of which there are a variety of beautiful specimens, is executed by Messrs. Strode & Co., London, Messrs. Verity Bros., London, and Messrs. Hoffer & Co., and consists of hall lamps, candelabras, chandeliers, brackets, &c.

The same principle of variety in manufacture applies to the stove department, which is replete with the most modern improvements in drawing- and dining-room stoves. They are

advantageously placed round the showrooms so that they can easily be inspected. The first to be noticed is a dining-room stove, with highly artistic frieze work on the newest principle, and filigree work in brass. The mantelpiece is of Brocatelle marble. The next specimen was a slow-combustion stove, with Crossthaite's patent marble canopy, fitted with Scales's fire-back, and the mantelpiece a new design in Brocatille. An imposing, massive drawing-room mantelpiece fixes our attention. It is of the St. Anne's pattern, with carved black marble panels. The frieze is 21 inches in depth, the width of the jamb is 18 inches, and the shelf is 4 inches thick. The grate is slow-combustion, and matches in elaborate design with the mantelpiece. The fender—a very massive one—gives an excellent effect. It is made of copper and brass—colours which give quite a charm to the suite. Crossthaite's patent "Union" stove, slow-combustion, the marble mantelpiece being rouge and black, is very effective. A handsome bronzed brass dining-room stove, with hand-painted tiles, set in a St. Anne's marble mantelpiece, is bright and artistic. Another very pretty stove, with copper and brass interior, is fitted with a massive rouge dining- or drawing-room mantelpiece, with black and green columns, a contrast in colour which is agreeable. A pair of Minton's panels increase the effect. The next stove is of quite new design, with copper and brass curtain work, and interior canopy, with hand-painted tile panels. The mantelpiece is appropriate, being of rouge antique and black marble. Next is a beautiful stove of best Sheffield make, with brass panels and curtain, a handsome design in copper deposited on the brass. The mantelpiece is of pure black marble, with green columns, and massive carved trusses and friezework. The shelf is 18 inches wide and 6 inches thick.

Perhaps the most elaborate and effective object in the showrooms is a magnificent mantelpiece in Italian Griotte marble, with green columns and green and black trusses, and shelves and massive black mouldings. The value of this mantelpiece is 50%, which will convey an idea of the workmanship and material. The stove is one of the best Sheffield make, with handsome brass mouldings and real bronze panels and canopy. The value of the stove is 30%. The fender is a splendid specimen of brass and real bronze, and having a massive bronze figure at each end. Space does not allow of further detail in this department. But there are many more stoves unmentioned, particularly several bedroom specimens; and what have been described will give an idea of their superior quality and the variety in design. Any modern im-

provement can be inspected in an assortment which is representative of the best work of the leading manufacturers.

A space is allotted to sanitary goods, baths and fittings, specialities manufactured by Messrs. Morrison, Ingram & Co., for whom Messrs. S. Dixon have the sole Yorkshire agency; and another to an exhibit of the Leeds patent floor-warming stoves, Wilson's gas fires, and Fletcher's fires and cookers.

Decorative work is represented by some beautiful specimens of pottery of the Burmantofts Company, Limited. Electric bells and numerous domestic appliances are also *en évidence*. We should not omit to mention a multitudinous variety of smaller domestic requisites, such as gay fire-screens, Austrian filigree work, door fittings, &c.

In nearly every instance Messrs. S. Dixon are placed, as far as price goes, in the position of the manufacturers, for they are the sole agents for Yorkshire, and all orders in that district must come through them. The firm, for instance, have the sole Yorkshire agency for the Wenham Lamp, and its popularity is so great that a special staff of skilled workmen do nothing else but fit up these lights, and success is invariable. This system of actually undertaking the work should commend itself to architects. The electric Wenham Lamp for outside lighting is a very improved light, and is now in great demand. The light and its method of application can be seen at Messrs. Dixon & Son's showrooms, or rather exhibition, for the goods are so well arranged and on a scale which few firms could emulate; so that practically Messrs. Dixons' showrooms form a permanent building exhibition.

#### REMINGTON STANDARD TYPEWRITER.

WE have received a circular descriptive of the Remington Standard Typewriter from Messrs. Wyckoff, Seamans & Benedict, of 100 Gracechurch Street, E.C. Several forms of typewriters have been invented, as is well known, but we cannot call to mind hearing much about any typewriter except the "Remington." This, it may be said, occupies the field among typewriters, as Pitman's system holds the field among processes for shorthand writing. Experts in the use of typewriters have written in detail on the merits and demerits of typewriters, and their critiques can be read by those desirous of more information. Here it is only necessary to point out that what is mainly to be looked for in such an apparatus is that it must give us the means of writing legibly with speed and with ease, and this the "Remington" does. Another

important point is that it can by no possibility bring on writer's cramp. A speed contest was held recently between the Remington Standard Typewriter and the Caligraph Writing Machine at Cincinnati, New York and Toronto, in which the Remington Standard Typewriter came off with flying colours as follows:—Remington, 97 words per minute; Caligraph, 77 words per minute. At Chicago Mr. McGurkin, being blindfolded with a handkerchief, wrote on the Remington Standard Typewriter, from new matter, from dictation, 125 words in a minute, with but three errors, the matter being properly punctuated. One of the merits of such an instrument, as is justly stated, is undoubtedly speed, but in this term should be included the important power to maintain speed, and it is eminently in this latter point that the construction of a machine tells. Foremost amongst the elements that contribute to the speed of the "Remington" machine is the compactness of its keyboard—one-half the size of the "Caligraph." The latter machine has seventy-two keys, but only fifteen of them are used in writing this particular sentence, "This is a song to fill thee with delight," and an examination of the keyboard will show that these fifteen keys are all located in the centre of the keyboard; so that a record thus attained demonstrates nothing beyond the fact that a compact keyboard is indispensable for high speed—a conclusive argument in favour of the "Remington." The difficulty that "Caligraph" operators experience in ordinary work—retaining in the mind the location of seventy-two keys, and reaching a great distance for them—was thus avoided. In the circular of the caligraph an extract is given from the *Toronto Evening News*, apropos of the contest between the "Remington" and the "Caligraph," in which it is stated that the only means by which the comparative merits of the instruments employed can be judged is, not by writing usual connected matter, but by repeating on the machine again and again a single short sentence.

#### CONSTANT WATER SUPPLY.

At the meeting of the Court of Common Council last week, the chairman of the gas and water committee, Mr. H. Mead, presented a report from his committee on the question of a constant water supply. The reference to the committee was to examine and report on the petition of the vestry of the parish of St. Giles's Without, Cripplegate, praying the Court to take the necessary steps to call upon the water companies supplying the City of London with water to make arrangements for a con-

stant supply thereof. The committee communicated with the company, who expressed their willingness to confer with the special sub-committee through the company's superintendent, Mr. Collins, and the committee were subsequently attended by that gentleman, whom they heard with reference to the various details connected with a constant supply of water, and who informed them that the company were perfectly willing to give a constant supply if called upon to do so, provided the regulations prescribed by the Metropolis Water Act, 1871, were previously complied with. Mr. Collins stated that the company had lately been called upon to provide a constant supply to the parish of St. Pancras, and he estimated that an average cost of at least 5% would be incurred by each owner or occupier of premises in providing the requisite fittings, and the expense in the City, owing to its exceptional circumstances, would probably be considerably more. In addition to this, if a new lead pipe from the main to the house were required, the expense would be considerably more, and the occupier would not only have to pay this, but the expense of pulling up the pavement. The committee were also informed that in case of a constant supply being provided all existing fire-plugs would have to be removed, and it was estimated by Captain Shaw that the number of hydrants would in such case have to be doubled, involving a large expenditure. Mr. Archibald Dobbs, a gentleman who has taken a great interest in the water question, wrote to the committee stating that he felt very strongly that the citizens would regret it if the petition in favour of a constant supply were granted; and subsequently, at an interview with the committee, Mr. Dobbs expressed his opinion that if cisterns could be dispensed with a constant supply would no doubt be of advantage, but he pointed out that, although the Act does not require it, it is necessary for occupiers to retain cisterns for their own protection, so as to store sufficient water for, say, twenty-four hours' consumption. If the cistern were dispensed with, serious inconvenience would be suffered by the occupier in case of any repairs to the pipes being required, the water in such case being turned off without notice. The committee then ascertained that out of the 112 parishes of the City only 15 had expressed opinions on the subject. Of these 15 parishes 6 had sent in resolutions in favour of a constant supply, 4 against, and 4 had passed resolutions in favour of a constant supply which had not been received by the committee. Having thus obtained full information on the subject, and having given the matter every consideration, they conclude it is not expedient, in the interests of the petitioners and the

citizens generally, to take any steps in the direction indicated. The committee add that, "It must not be lost sight of that the memorials presented to the Corporation from various vestries do not ask that the constant supply may be given to their respective parishes only, but that it may be extended to the whole of the City. Several parishes, however, having expressed opinions adverse to the system, it would be obviously unfair to apply it to the City generally, and we would suggest that, if it be decided to adopt a constant supply in the City at all, it should be applied only to those parishes which have expressed a desire for the same." Mr. Mead, in moving the adoption of the report, said that, looking at the enormous cost—estimated at 300,000*l.* or 400,000*l.*—which would be saddled upon owners in the City in making the necessary alterations of fittings, &c., they recommended that the Corporation should take no further steps in the matter. The report was adopted.

#### REGISTRATION OF PLUMBERS.

A LARGELY attended meeting of plumbers was held on Friday evening in the Burgh Court Room, Dundee, when addresses on the subject of technical education were delivered. A great number of the younger members of the craft were present. Mr. John J. Henderson, architect, presided, assisted by Professor Ewing and ex-Bailie M'Neill, and various district secretaries of the National Registration of Plumbers. Professor Ewing said that he thought the movement one of special interest, as being one initiated by the trade itself. Generally speaking, the matter of technical education had been put forward by persons outside the respective trades. But one sprung from within a trade was much more likely to succeed than one springing from without. He understood that the object of the meeting was to make a formal request that the subject of instruction for plumbers should form a portion of the course at the newly established Technical Institute at Dundee. The plumbers took the lead in this respect, and he should be surprised if the committee did not see their way to accede to their request. The establishment of classes of this kind involved two considerations—(1) the question of ways and means; (2) how they were to get teachers. As to the question of expense, he understood that the Worshipful Company of Plumbers in London had promised a grant in aid of the classes, provided an equal amount were subscribed locally.

The Clerk gave statistics of similar classes in various English towns, and at the conclusion between forty and fifty plumbers joined the classes.

#### MANCHESTER SHIP CANAL.

THE great basin which is to form the side of the locks at the Eastham Terminus has now assumed the appearance of a ravine 200 yards in width. It is computed that 1,500,000 cubic yards of earth have been moved on this section. In order to get rid of this amount of material, it has been found necessary to form what is practically new land in that vicinity. The hollows of Eastham near the shore have been filled up over an area of some acres. A large quantity of green-heart timber, a kind of larch, the most durable timber known for withstanding the action of water, has just arrived ready for the building of the great lock gates, which will be the largest in the world, excepting perhaps the gates constructed for the locks at Hull. These gates will be 80 feet wide. Three locks are to be built at Eastham abreast of each other. The smallest will be 150 feet by 30, the next 350 feet by 50, and the largest 600 feet by 80 feet. The difficult task of cutting a railway across Pool Bay is nearly completed. When finished the railway embankment will form the base of the outer wall of the canal. The number of men employed has been reduced to the winter staff, namely, 1,100, against 1,800 forming the summer staff. Nine steam navvies are constantly engaged excavating the canal for this important section.

#### WATER SUPPLY IN JAPAN.

IN a recent report, the Belgian Minister to Japan states that during the past year the Governor of Yokohama has had waterworks for that town constructed under the superintendence of General Palmer, of the Royal Engineers. In consequence of the success which has attended this undertaking, several other towns have applied for a similar water supply, and the subject is now being carefully studied. In Tokio, also, arrangements are about to be made for improving the supply, but it is not yet known whether the State will defray the prime cost or leave it to a private company. The difficulty at present consists in providing the funds, amounting to about a million sterling. The city has 1,300,000 inhabitants, and enough water

would have to be provided for 2,000,000. The question is a pressing one for Japanese towns, because the wells are for the most part fouled by reason of their proximity to the rice-fields. Under these circumstances, the Minister advises Belgian manufacturers to be on the alert. The Japanese Government have not adopted the system of tenders, and therefore it is necessary that agents should be on the spot, fully authorised to make proposals to the authorities, who have as yet arrived at no conclusion in respect to the further construction of waterworks. The British Consul in Yokohama, in his report, also refers to General Palmer's new supply for that town. The intake is about 25½ miles from the filtering-beds, and the construction of the works was rendered extremely difficult in various places by the rugged and hilly nature of the country, which necessitated the opening of a temporary road, the erection of several bridges, and the excavation of cuttings; but, in spite of all obstacles, the undertaking was completed within the specified time.

### ELECTRICITY FOR TRAMCARS.

AN account is given by the *Birmingham Post* of an electric motor which is to be tried on the Central Tramway Company's lines in Birmingham. The motor, together with the necessary dynamo machine and accumulators, has been manufactured by the Elwell-Parker Engineering Company, Limited, Wolverhampton, and the trial, or rather series of trials, for they will extend over several days, are likely to be of great importance. It is designed to demonstrate the advantages of electricity over steam, alike as regards efficiency, economy, and public convenience. The Elwell-Parker Company are constructing the motor for the Julien Company, London, who own the Belgian patents which go by this name, but the dynamo and accumulators are the Elwell-Parker Company's own patents. The motor is what is termed a small bogie engine, and in appearance is similar to the steam-tramway engines now employed on the Central Tramways. All the working parts are completely covered in by sheet-iron to a height of 5 feet, all that can be seen being a small portion of the wheels upon which the motor is mounted. A sheet-iron roof extends the whole length of the motor, giving perfect weather protection for the driver. The dimensions of the motor are 9 feet long, 5 feet 8 inches wide between the rails, and 9 feet 6 inches high. It is some four tons lighter than the steam-engines now employed, weighing 8 tons as against

12 tons, and it is of 40 horse-power capacity. The motor travels noiselessly, and the inventors state that it is much more under control than the present steam-engines. The accumulators for providing the motive power will be carried on the engine, and in order to be of equal power with the locomotives now employed by the company, which cover an average of some fifty or sixty miles a day, it is arranged that one charging of the accumulators shall be sufficient to enable a fifty-miles run in the working day at the same speed as at present. The whole machinery will be under the control of the driver, and a double set of driving-machinery is fixed on the motor, one set at either end, so that in making the return journey there is no necessity to turn the engine. The speed is controlled by a switch, which is covered by the Julien patent, and which allows of the power drawn from the accumulators to be so regulated that, without any waste, a uniform rate of speed can be maintained, whether the engine is travelling along an incline or a decline, or on a level road. The brake handle is placed to the right hand of the driver, who by one operation applies four powerful brakes, one to each wheel. It is estimated, as the result of previous experience of the Elwell-Parker Company with electric tram-motors built by themselves, that it will be found that in dry weather the car can be stopped on level ground in half a dozen yards, and in ascending a steep incline in half that distance; but in wet weather a considerable allowance would have to be made for skidding the wheels, the distance occupied in pulling up in that event being probably seventeen or twenty yards. Until the trials come off these distances must, however, be regarded as approximate only.

The accumulators, or battery cells, are arranged along the whole length of the floor of the motor on either side, and are also ranged on two shelves running above the level. They are placed in four rows of twenty-five each. Each cell consists of a small box a foot long and deep, and 7 inches wide, and containing thirty-seven accumulator plates. These plates are constructed alternately of lead of a spongy nature and peroxide of lead, and each is very carefully separated from its neighbour by indiarubber bands to prevent what the electricians term "short circuit"; in other words, to prevent the electric force from discharging itself in each cell and becoming wasted. The cells are filled with a solution of sulphuric acid and water of a specific gravity of 1.170, and each cell when so charged weighs 101 lbs. A fringe of about 2 inches wide of indiarubber projects over the surface of the cells to prevent the acid from spilling when the car stops or starts. The capacity of the

PATTERN BOOKS ON APPLICATION.

whole battery of 102 cells is 280 ampères, and it will be charged without removal from the motor from a dynamo machine fixed at one of the company's dépôts. This dynamo, which the Elwell-Parker Company have also supplied, will develop 18 units, which is equal to 24 electrical horse-power, or about 30 actual horse-power. It runs at 950 revolutions per minute, and gives off a continuous current. The steam-engine force which will be required to drive this dynamo is about 30 or 32 horse-power. To charge the battery, the operation consists in running the motor off the line into the company's shed or dépôt, when two copper wires are stretched from the dynamo to the battery, and, the negative and positive poles of each being connected, charging commences. Six or eight hours will be ordinarily occupied in this charging operation, after a day's work, the exact time depending upon the amount of power which has been expended on the previous day. Supposing the battery has been completely exhausted, the charging would occupy a period of ten hours; but this, it is estimated, would be a very occasional event, since it is never desirable to thoroughly exhaust the power on account of the excessive wear which results. The length of life of the accumulators depend upon how they are treated in this respect.

#### EAST LONDON WATERWORKS COMPANY.

In *The Architect* of last week it was reported that in the case of Johnson v. the East London Waterworks Company, Mr. Lushington had decided the question in favour of Mr. Johnson. A correspondent, writing to the *Times* under the signature of "A Lover of Justice and One who has Studied the Water Companies Acts," says:—At the hearing of the summons against the East London Waterworks Company on the 19th at the Thames Police Court, which resulted in the company being fined, the company's solicitor, Mr. Kebbell, informed the complainant that "he would be sorry he had won the case by the time it got to the House of Lords." Now, as a statement of this kind is likely to deter Mr. Johnson from defending proceedings in a superior Court, permit me to mention that water companies when contesting a point invariably intimate their intention of appealing from Court to Court, the consequence being that in nine cases out of ten the overcharged consumer caves in, after, perhaps, a short and feeble resistance; but public attention having of late been directed to the manner

in which water companies exercise their charging and other powers, the sooner Mr. Johnson's case is carried to the House of Lords the better. Consumers and ratepayers still continue to pay too highly for certain supplies, and it is to be hoped when the new county council is formed that the metropolitan water undertakings will either be bought up or controlled.

#### MEASURING OF TIMBER.

IN the Falkirk Sheriff Court, on Friday, Sheriff Scott-Moncrieff issued an interlocutor in a case of some importance to the timber trade relating to the measurement of a cargo of sawn timbers. The captain and owners of the barque *Rosa Bonheur*, of Liverpool, sued Messrs. P. & J. Wilkie, timber merchants, Grangemouth, for the difference in freight, calculated upon a measurement of a cargo of sawn timber made by the Custom House measurer at the request of the captain, and a measurement made by an ordinary sworn measurer employed by the merchants. The Sheriff in his note to the interlocutor says the difference between the measurements is small, but there is a principle at stake concerning which there has been much anxious contention. The defenders say that, according to the custom of the port of Grangemouth, the merchant is entitled to select his measurer, and to pay freight upon the measurement reported by him. Further, they contend that the expenses of the measurement are to be paid equally by the captain and the merchant, and accordingly they claim a deduction in the present case representing half the measuring fees. It cannot be seriously disputed that for many years back, in the majority of cases, the practice has been as set forth by the defenders. As to this, it seems to me that the weight of the evidence is unquestionably on the side of the defenders. A general practice, however, and a custom binding as a law are not exactly the same thing. In determining whether this practice is to be treated as a custom of such a nature as to be binding upon a foreigner protesting against it, certain considerations must be kept in view. In the first place, it is not unimportant to consider its probable origin. In the usual case the captain of a timber vessel is not a British subject, and is probably but imperfectly acquainted with our language. He may be totally ignorant of the port into which he has come. In these circumstances it is not unnatural that he should, without recognising any custom of port, acquiesce

in the selection of the measurer by the merchant, who is a local man. But even when not satisfied with such a selection, the dread of delay and possibly litigation in a foreign land may easily account for a waiving on his part of any objection. There is evidence to support this suggestion. Captains have protested and afterwards consented to the course followed by the merchant. A few have persevered and succeeded in their opposition to it. There seems to be some ground for holding that measurements at the instance of the captain have become more numerous in recent years. But the most important consideration in a case of this sort is the question of the reasonableness, or unreasonableness, of the alleged custom. That the captain should go for his measurement to a Custom House official is in the highest degree reasonable, and it is not unreasonable that he should decline to admit the nominee of the merchant. The Sheriff, after going into all the circumstances of the case as brought out in the evidence, finds that the defenders have failed to prove any custom of port in virtue of which the pursuers are bound to accept a measurement of the cargo made upon the defenders' instructions, and to pay one-half of the measuring fees; but, in consideration of the conflict between the measurers, he finds that the cargo must be estimated at the defenders' measurement, which is somewhat lower than that of the pursuers, and freight paid accordingly. The Sheriff also allowed the defenders a small sum for wood undelivered by the pursuers, and decreed against the defenders for the balance of freight, but found no expenses due by either party, as success in the action had been divided between them.

#### SEWER AND DRAIN VENTILATION.

PARTICULARS have been sent to us by Mr. Thomas P. Worthington, architect, of Blackpool, of a scheme which he has recently patented for the better ventilation of sewers and drains, and for the disinfection and destruction of the germs contained in the poisonous gases which may be thus drawn to the surface. Mr. Worthington's purpose, broadly speaking, is to make the gas-pillars which are to be found in every street perform this dual work. Obviously, to have free ventilators there must be free inlets and free outlets. Inlets without outlets are worse than useless. At present the surveyors think it sufficient to provide open manhole covers, or vent-grids in connection therewith, at the street or road level. These are

supposed to "ventilate," i.e., to aerate our sewers. In this system, gas-lamp standards, having considerable sectional area with free vent, are provided with large disinfecting and deodorising chambers in the lower parts, and funnel-mouthed extracting ventilators on the lamps at the top into which the heat from the gas jets passes. The temperature therein is more than boiling heat continuously, and it cannot fail to reduce the bacilli and other sewer germs and organisms to impotence from harm. The bottom of the standards must, of course, be in direct communication with the sewers they are intended to ventilate. The following advantages are set forward:—That the system is effective; it is not expensive; it can be adapted to all sewered streets and thoroughfares inexpensively; these standards will thoroughly aerate the sewers, offering the greatest facilities for numerous outlets, which will thereby do away with the congestion and accumulation of poisonous gases in sewers; it answers the purpose of a lamp as well as a ventilator and disinfectant; it has a double protection against the outlet of disease germs; it has no automatically-movable parts, and therefore cannot get out of order; it requires no further attention than the ordinary gas-lamps; the chemical disinfectants may be placed easily by any labouring man; so far as chemical disinfectants can be relied upon, the arrangement of the chamber compels the contact and consequent disinfection of the sewer air before it gets to the lamp, where it is burnt and discharged into the open air; it has the appearance of an ordinary gas-lamp post, and therefore does not indicate its unsavoury but necessary utility; it can be made plain or ornamental. Four of these lamps have recently been supplied to the Blackpool Corporation.

#### PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Cassell, Consulting Patent Agents, 43 Southampton Buildings, Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

#### APPLICATIONS FOR PATENTS.

GRUNDY'S PATENT  
WARM-AIR  
VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent  
consist in the heating surface being greater than any other  
Fire-grate introduced to the public. It is very simple in  
construction, and is made in the form of a Stove, the back  
of which is semicircular in shape, with gills behind and  
smoke-nozzle on top, all cast in one piece. The same can  
be attached to any design of a Register or Stove front. It  
is very suitable for schools, class-rooms, waiting-rooms,  
hospitals, offices, dormitories, and dwelling-houses, from  
the cottage to the mansion. Design and specification post  
free on application.

TESTIMONIALS.

9 Victoria Chambers, Westminster, S.W.  
SIR.—I have much pleasure in testifying to the efficiency of  
your patent warm-air fire-grate. It has been very successful,  
and given every satisfaction where I have used it.  
Yours, &c., JAMES WEIR, F.R.I.B.A.,  
To Mr. Grundy, 8 John Street, Bedford Row, W.C.

From ARTHUR W. BLOMFIELD, M.A., Esq., Architect,  
28 Montagu Square, London, W.

Mr. Grundy, of Tyldesley, near Manchester, has carried out  
his plan of warming in several churches built under my  
direction, and in each case it answers remarkably well, and has  
given great satisfaction.

From Professor W. B. ROBERTSON, M.D., West Dulwich, S.E.,  
September 1, 1887.

DEAR MR. GRUNDY.—I value your apparatus very highly  
indeed. I regard it as the greatest comfort I have in this house.

From Rev. A. FERGUSON SMYLY, Dean of Derry, The Deanery,  
Derry, September 16, 1887.

DEAR SIR.—I cannot refuse to give you a few words of com-  
mendation as to the apparatus you supplied for heating Derry  
Cathedral. Not only is the air of the Cathedral quite pure and  
pleasant to those attending the services, as it must be from the  
fact that most of the air heated is taken from the outside, but I  
find the building itself is so much benefited, as formerly it was  
damp and smelt damp, but now it is very dry and free from any  
musty smell. I find that, although the Cathedral is now much  
larger, the cost of firing is much less.  
To Mr. John Grundy, 30 Duncan Terrace, City Road, London.

From Hon. and Rev. G. G. C. TALBOT, M.A., Withington,  
Cheltenham.

DEAR SIR.—You will be gratified to hear that the school is  
completely warmed by your new grate. It is the most economical  
and efficient that I have ever seen.  
Mr. John Grundy.

11460. Charles A. Priestley and Sydney Gurney, for "Improvements in wood-block flooring." August 8, 1888.

11462. Bernard Cassidy, for "Improvements in and connected with corrugated sheet metal roofs." August 8, 1888.

11473. Jacob Davies, for "Improvements in the construction of kilns for burning bricks and other similar articles." August 9, 1888.

11536. William Verity, for "Improvements in means for operating window-sashes." August 10, 1888.

11796. Denis O'Halleran, for "Improvements in bell-pulls." August 16, 1888.

11805. George Salter, of G. Salter & Co., Birmingham, for "Improvements in sash-fasteners." August 16, 1888.

11914. J. W. Helps, for "Improvements in the method of and apparatus for disconnecting gas and water mains, and for effectually closing the ends thereof." August 17, 1888.

12541. John Bennett Cook, for "Improvements in water-closet apparatus." August 31, 1888.

#### COMPLETE SPECIFICATIONS ACCEPTED.

Notice is hereby given, that all persons interested in opposing the grant of a patent on any one of the undermentioned applications may, at any time within two months from the date of the official *Journal*, give notice at the Patent Office in the prescribed form of such opposition.

14554. Robert Bristowe Lee, for "Improvements in the manufacture of concrete and cement fireproof building materials and parts of buildings, bridges and other structures, safes, strong-rooms, slabs, blocks, baths, tanks, and other articles, parts, and receptacles." October 26, 1887.

14716. Alfred J. Hopkins, for "Improvements in means of and apparatus for fastening and securing blocks of wood and analogous substances in position when used for flooring and other purposes." October 29, 1887.

15355. A. Patrick, for "Improvements in brickmaking machinery." November 10, 1887.

372. William Gibbs, for "Improvements in glazing." January 10, 1888.

16093. John Sander Stevens and Charles George Major, for "Improvements in and connected with hydraulic lifts." November 23, 1887.

7669. H. P. Miller, for "A new or improved means of and apparatus for attaching sash-lines to window-sashes." May 25, 1888.

11271. C. P. Kinnell and Geo. Rothnie, for "Improvements in apparatus for balancing and opening sashes, casements, or ventilators." August 3, 1888.

#### PATENTS SEALED, SEPTEMBER 21, 1888.

12141. George Kelley, for "Improvements in locks and latches." September 8, 1887.

12765. Mark W. Samuel, for "Manufacture of a plastic compound and treatment thereof for the production of moulded and decorated tiles and other articles." September 20, 1887.

14229. Henry Harris Lake, for "Improvements relating to wood-paving." October 19, 1887.

1175. Jos. Arnold, for "Improved apparatus for deodorising and disinfecting sewer gases." January 25, 1888.

#### ABRIDGMENTS.

"Improvements in the construction and working of fireproof iron and other curtains or screens for theatres and large openings." No. 14556. 1887. John Stones, The Mills, Ulverston. The principal feature of this patent seems to be that corrugated sheets of iron or steel are used, to contain a padding of silicate cotton. These corrugations help to keep the silicate either from falling or shifting.

*Claim I.*—A fireproof curtain or screen, consisting of an open frame or combination of frames, covered on one side with corrugated sheets of steel or iron, and on the other side with plain sheet steel or iron, the intermediate or interior part or parts being padded or lined with silicate cotton substantially as described and shown.

*Claim II.*—A fireproof curtain or screen, of an open frame or combination of frames, covered on both sides with corrugated sheet iron or steel, the intermediate part or parts being padded with silicate cotton substantially as described and shown.

"Improvements in heating stoves." No. 10034. 1888. R. W. Boyd, ironmonger, 105 New Bond Street, London. This improved coke baking or heating stove is so constructed that the gills or plates of which the stove is formed project into the fuel chamber, so as to absorb all the available heat, and in their turn conduct such heat to the outer and corrugated surfaces for delivery to the room or space to be warmed. The draught is regulated by a sliding air-tight ashpit; the flue is controlled by a butterfly or other valve.

TO INVENTORS.—Patents for Inventions, Trade-marks, and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CASSELL, Patent Agents, 43 Southampton Buildings, Chancery Lane.

# FIRE! FIRE! FIRE!

## GRIFFITHS' "PYRODENE" FIREPROOFING LIQUID

(NON-POISONOUS).

### Transparent Liquid for Rendering Woodwork Uninflammable,

Without altering its appearance, and where Painting is not desired, such as Wooden Fittings in Exhibitions, Churches, Pews, Matchboarding, Theatre Scenes, Wooden Stairs, Joists, Beams, Floors, Factories, Stables, Mills, &c., in fact, Structures of an inflammable nature of all descriptions. Acts as a priming for new Woodwork for Paint or Varnish. Also for rendering Theatrical and Ball Dresses, Curtains, Paper, Felt, Canvas, &c., perfectly uninflammable.

Griffiths' Liquid penetrates the pores of the wood. It lasts as long as the wood itself. It prevents Dry Rot and decay in house timbers. It does not crack, peel, or rub off.

It is perfectly innocuous and free from smell. It will keep any length of time. Any one can apply it. One gallon will cover double that of any other priming.

AND

All Woodwork in new houses should be fireproofed with this liquid, the cost is so trifling in comparison with the preservation of the timber and freedom from risk of fire. If work is desired to be painted afterwards, Griffiths' Pyrodene Paint is best for the purpose.

## GRIFFITHS' "PYRODENE" FIREPROOF PAINT.

READY FOR USE. NON-POISONOUS. ALL COLOURS.

This Paint is manufactured for preservative and decorative purposes equally as for its FIRE-RESISTING qualities. The Fireproof Paint and Fireproofing Liquid is used at some of the principal Theatres in the United Kingdom.

#### RECENT TESTIMONIALS.

From Messrs. MAXWELL & TUKE, Architects, 29 Princess Street, Manchester: December 28, 1887.

DEAR SIRS.—We used your Paints in nearly the whole of the works for the Royal Jubilee Exhibition, and with very satisfactory results.

Yours truly, MAXWELL & TUKE.

To Messrs. Griffiths Bros. & Co., Dashwood House, London, E.C.

From S. C. LOWE & SON, House Decorators, 32 Cavendish Street, Stretford Road, All Saints, Manchester: November 22, 1887.

DEAR SIRS.—In reply to your inquiry, we, as one of the contractors for the painting of the Manchester Jubilee Exhibition, which closed on the 10th of this month, have pleasure in stating that both your "Aqual" Paint, and also your "Pyrodene" Fireproof Paint, have given great satisfaction. We found them work easily with a covering power of from 30 to 40 per cent. over ordinary paint. Although applied during intense frost, and having been subjected to an almost tropical summer, followed by the drenching rains of this autumn, they are as fresh in colour and have as firm a grip as when applied, and appear quite unaffected by the nine months' exposure. We consider them, therefore, well adapted for all work in any climate.—Yours truly, S. C. LOWE & SON.

Merchants. Foreign Orders through Merchants only.

The advantages of this Patent  
over other existing Lamps  
are:—

Small consumption of Gas  
with great Illuminating power.

No possibility of the Burner  
corroding or getting out of  
order, as is the case with other  
generative gas lamps.

The Lamp can be fitted by  
any gasfitter. No fine per-  
forated metal, gauze, or other  
obstructions are used in this  
Patent, as in other lamps which  
are liable to become choked  
through imperfect combustion,  
rendering the lamps smoky and  
useless.

# The Architect.

## THE WEEK.

BRITISH art cannot be represented at the Exhibition which is proposed to be held next year in Paris unless funds are provided to defray the expenses of a British Art Section, freight, insurance, packing, &c. Sir FREDERICK LEIGHTON, P.R.A., in a letter to the Lord Mayor, who is president of the Executive Council of the British Section, writing "as one on whom his office lays the duty of speaking from time to time in the name of British artists," deploras the decision of the French Government not to bear a share in the expenses of a British Art Section. He had clung to the hope that the liberality shown by Antwerp, Berlin, Munich, &c., would be displayed also in Paris. He says:—"Unless private liberality can be enlisted to supply the funds, we alone shall remain unrepresented at this great display of the contemporary artistic achievements of Europe; and this, too, at a time when the great qualities of our School, its sincerity, its healthiness, its versatility, have succeeded, precisely through the agency of International Exhibitions, in winning a large degree of sympathetic appreciation in places where, not many years ago, it was almost wholly unknown." The sum required, 3,000*l.*, is not large, and a wealthy country need not require to be subsidised at every European exhibition. Sir FREDERICK has contributed 100*l.* towards the proposed fund, and if twenty-nine among the remainder of our British artists follow suit the difficulty would be ended. As it is, the Executive Council have been able to promise 500*l.*, so that only 2,400*l.* is required from private sources.

THERE is apparently no word in the language the meaning of which is so little understood as the word "architect." It is to paragraphists and special correspondents what the wand is to a conjuror. For instance, take some Government building here or in India designed by some Government official. In natural course it soon betrays its jerry origin, and newspapers chronicle the misdeeds of the architect of the building, a man who has no existence, except in the untutored brain of the writer. Suppose something went wrong with house drains that were designed and laid under the supervision of Dr. RICHARDSON, that worthy gentleman need not fear for himself. A mythical architect would receive the blame. Sometimes the purveyor of news might throw more precision into his narrative and boldly put the blame on the late Sir GILBERT SCOTT. Lord GRIMTHORPE, too, if anything went amiss at St. Albans Cathedral, would escape the diatribes that are showered on architects, and Sir GILBERT SCOTT or Mr. PEARSON would be found to be the culprit. Lord GRIMTHORPE freely uses his lance on all sides. Neither he nor architects are beyond making slips in their work. But when ignorant and also educated men join their forces to attack architects on each flank, the public delusion that architects are at the root of all mischief is likely to be strengthened rather than dissipated, if architects do not expose the fallacies of opponents.

In spite of the grand scale of the hotel charges in Ostend, which in the season surpass those of Dutch villages, it is impossible to obtain a glass of water that is potable, either in the old town or on the Digne. A scarcity of drinking water is enough to raise apprehensions in a place where at least twelve thousand strangers are congregated in a limited area. The authorities have therefore set to work to discover an available source for a water supply. It is evident they have not succeeded in their search, as they now invite speculators to construct waterworks, without giving any intimation of an available source. There are plenty of sand dunes around Ostend which might be turned to account. But no hotel-keeper will care where the water comes from so long as there is a plentiful supply.

THE excitement about the defalcations in the offices of the Belgian Chemin de Fer du Nord having abated, another and more important case has suddenly cropped up. It relates to the Department of Public Buildings. As soon as

M. DE BRUYN, the Minister of Works, took possession of his post, he set about an investigation of the duties of the various officers. From information received, the Minister was anxious to discover if any irregularities existed, and he is said to be successful. According to the journals, correspondence exists showing that one of the officers was in the habit of receiving a commission from contractors who were recommended by him to the administration. It is said that M. DE BRUYN has placed the case in the hands of the Minister of Justice. In Belgium there are just now many allegations of the kind in currency, but it does not follow that they are all well founded, for the public service of the country is at root honest.

THE University of Liège is among the most successful of the technical schools of our time. More than fifty professors are employed. The buildings are of various dates, and are inadequate to the teaching of fourteen hundred students. The nucleus of the building was an old Jesuit college, which was increased in size by various additions between 1817 and our time. For a long time the erection of buildings worthy of so important an University has been considered by the authorities and the Government. Plans, it is believed, have been prepared and are now under consideration of the Department of Public Works. The chief difficulty to be apprehended is how to carry out the works without disturbing the classes. The collections are, moreover, of great value. It is not likely that a new site will be proposed, and a piecemeal construction is therefore inevitable. It will have one advantage to the taxpayers, as the expenses will be distributed over a long period.

THE second volume of the *Revue Illustrée* could hardly make a better start than with the first part of the narrative of M. EMILÉ MICHEL'S travels in search of information respecting REMBRANDT in the north of Europe, which when completed will form a text-book for the tourist in Russia and Sweden. As is usual in this magazine, there are several papers on art, which are abundantly illustrated. The tragedy of GERARD DE NERVAL is once more told, and the writer's recollections come as a supplement to those of M. MAXIME DU CAMP. According to the latter, DE NERVAL hung himself with the aid of a belt which he imagined was the zone of one of the court beauties. It is remarkable that the brothers DE GONCOURT (who were allied with THÉOPHILE GAUTIER, one of the best friends of the unhappy writer) do not say a word in their journal about the romanticism of his end, although for years literary men and their hangers-on used to make a pilgrimage to the alley where one of the finest spirits of his time renounced a world that shut its doors against him in winter. The *Revue* is the most interesting of all the monthly publications of the Continent, and, unlike most others, it may safely be admitted into English households.

THE Commission of Inquiry appointed to investigate the fall of the tower of the Church of the Covenant, Washington, have issued their report, from which it appears that the disaster would not have occurred if the specifications had been properly carried out. The rubblework, of which there was a considerable amount, was of an inferior nature, as well as the mortar, and the material was badly bonded. The work was neither first-class, nor of the best kind. "In form and dimensions," the Commissioners say, "the design of the tower furnishes a thoroughly substantial and permanent structure, needing but the simplest kinds of good materials and workmanship for its proper erection."

THE death has just occurred, suddenly, though not altogether unexpectedly, of Mr. J. GAMBIER PARRY. Mr. PARRY was well known in art circles, and has also done good service by valuable contributions to the literature of art. The last of the works on art published by him was "The Ministry of Art." The painting in Ely and Gloucester Cathedrals he has left as memorials of his practical work, as well as the frescoes in Highnam Church, which edifice he built and endowed. He received his education at Eton and Trinity College, Cambridge, and in after life filled the offices of Justice of the Peace, Deputy-Lieutenant for the county of Gloucester, and High Sheriff.

### THE EXHIBITION OF MONUMENTAL ART IN BRUSSELS.

IT is to be regretted that the mayors and auxiliary authorities of English cities and towns do not visit Brussels at the present time, in order to study that part of the Exhibition which is devoted to monumental art. They would see there many things which ought to give rise to reflection. Some one might during such a visit ask the question, Why in such an Exhibition, where so many countries are represented, is there not a scrap of paper or canvas to suggest that Great Britain has realised the advantages of decorating the walls of public buildings with paintings that are not portraits of men who have held office for a brief period—men whose names cannot be rescued from oblivion by all the artist and the frame-maker can do? There is scarcely a town in France or Belgium without pictures which can give pleasure to the humblest inhabitant, for in them he can see something that relates to himself. In one Paris Mairie the work of loading and unloading of barges at a neighbouring canal has been taken as a subject; in another the traffic in old clothes is idealised; and indeed the French painters, like some modern poets, have done their best to glorify labour. In Belgium much is found that must make people feel the historical importance of their native town. Who can forget the series by M. PAUWELS in the Cloth Hall of Ypres, and the no less memorable painting by M. GUFFENS representing the entry of PHILIP THE BOLD? It is in the town hall of Antwerp a student of painting must seek the best work of LEYS. In Courtrai the connection of the town with the Crusades and the Battle of the Spurs is made plain by the painter's pencil. The aid of sculpture is also invoked towards the same end. One example will suffice to be named, viz., the little square in Brussels known as the Petit Sablon, which is surrounded with excellent figures of workmen of all trades in Mediæval garb, that are supposed to be fitting companions for the statues of the patriots EGMONT and HORN. The poorest people in one of these Belgian towns, as they gaze on pictures and statues, must feel they have some share in the history of their country, and who can tell how much they must gain by a thought of that kind?

In another sense monumental art assumes importance. The commissioners who are responsible for the Exhibition in Brussels explain it when they say that monumental painting derives interest which no other class of painting can have from its connection with architecture. Then there is the elevation of the subjects, and besides, if monumental art can claim perfection, there must be harmony between the architecture and the work of the painter and sculptor. All these facts are recognised everywhere on the Continent, but we are either ignorant of them or indifferent to them in England. Mr. WATTS and Mr. ARMITAGE have shown their readiness to decorate public buildings at little more than the cost of materials, but the authorities evidently considered that mural painting was too dear at that price. Sir FREDERICK LEIGHTON, Mr. MARKS, Mr. COKE, and a few others have made it plain that painting, which has as much right to be called monumental as many of the works in the Brussels Exhibition, is feasible in England, but how many town councils have given them commissions? Yet painting of the kind would be less costly than the portraits of mayors and town clerks, which somehow are obtained, although it is supposed money cannot be expended on art.

In the division of monumental art at Brussels we see another instance of the predominance of Germany in Europe at the present time. The visitor on entering cannot fail to be struck with the colossal equestrian statue of Prince BISMARCK. The statesman appears in the uniform of a cuirassier, and the horse (after the manner of HENRI REGNAULT's *General Prim*) is apparently obliged to stretch out his fore-legs in order to sustain the weight of the rider. A more fitting work could not be found for the place. The figure of BISMARCK is suggestive of force organised into power, and it may be said that all the German works are tributes to power under various forms. In the German section of the gallery there are no idylls like those in the French section. The men who are represented are warriors, although, like LUTHER, their battles were fought as civilians.

The immense cartoons by Herr GESELSCHAP for his mural paintings in the Salle d'Honneur of the Berlin Arsenal are

striking examples of the spirit which inspires the German decorators. The subject may be said to be a Titanic battle, in which the agencies of evil are overcome by disciplined force. Giants, strange beings that seem to have been suggested by the Witches of MACBETH, mighty serpents of a length to enfold a world, are all on one side, but the sight of a few celestial warriors throws them into panic. The moral to be drawn is of course that one way to success in war is by the aid of the Prussian system. One cannot have much sympathy with combats between mythological warriors, but the lesson he teaches is illustrated by the painter's own practice. The figures are of heroic size, but there is not a line which does not reveal noble draughtsmanship. All pictures which preach a moral are said to be bad pictures, but much may be pardoned in a cartoon, and the science of arrangement and drawing of Herr GESELSCHAP must be recognised by every critic.

Professor VON WERNER in his work narrates feats of strength of a more human kind, for his theme is the Franco-German war. In all his pictures we have a suggestion that the Germans, and especially the German chiefs, are more than mortal men. The painter might have read HOMER before he set to work on the canvas. But, if looked at impartially, it must be admitted that in his battle scenes—such as the *Attack of the Spickern Hills*—there is an air of reality, and that they do not affect us like the pictures of DÉTAILLE and DE NEUVILLE.

WILHELM VON KAULBACH is represented by engravings of the paintings on the staircase of the Berlin Museum. In them the plan is adopted of having above a group of spectators, who look down upon the events which are transacted below. In the *Crusaders before Jerusalem* the watchers are CHRIST and a host of angels; in the *Epoch of the Reformation* LUTHER and his co-labourers are watched by the people whose minds were supposed to have been emancipated. The originals are known to all who have visited Berlin, and they will recall the weird expression which is seen in so many of the faces. KAULBACH did not believe that the commonplace could be characteristic of such crowds as he painted. Every figure has an individuality, and even when, as in the figure of the flagellant, the face is not seen, the action is sufficient to indicate character. The painter also departed from the type of figure which is most admired in Germany, preferring to make his warriors lithe and spare rather than over-weighty in muscle. The pictures are unlike all others, and about their impressiveness there can be no doubt.

RETHEL, who died about thirty years ago, was another of the great decorators of Germany. Some photographs are shown of his series illustrative of the life of CHARLEMAGNE in the Hôtel de Ville at Aix-la-Chapelle, but it must be admitted that they are less satisfactory than the plates which were published in *The Architect* several years ago. RETHEL dispensed with mythological elements and abstractions, and did not seek to be more than a painter of history. But in what he attempted he was successful, and in his grandest scenes he was never theatrical.

CORNELIUS, who inspired so many of the Germans, is not to be judged by the small engravings at Brussels from his paintings in the Glyptothèque at Munich and the Campo Santo in Berlin. But he observed one principle which his followers set aside. CORNELIUS's pictures can never be taken as easel pictures affixed to a wall. Usually he introduced a framework which was essentially ornamental, and gave a new and it may be a more fitting character to the picture that was enclosed. It is often very difficult to say why certain works should be accepted as decorative, and there is much to be said in favour of the system of CORNELIUS.

The name of BENDEMANN is honoured, and deservedly, in the history of German art. Dr. EDWARD BENDEMANN has sent several single figures of painting, sculpture, architecture, &c., which are in a severe and learned style, and the pictures from the hall of the Normal School at Düsseldorf are admirably composed. The drawings from the paintings by Herr PAUWELS, of Dresden, in the Ecole des Princes at Meissen, suggest works that are intended to preserve the memory of the good deeds of sundry princes in the minds of students who are the descendants of the old retainers of those ancient Electors. The painter's work in Belgium should have been illustrated in the Exhibition.

Austria fills a large part of the Exhibition, although we know many important works which are not reproduced in the collection sent to Brussels. The paintings by Herr GRIEPENKERL, of Vienna, in the hall of the Academy of Sciences in Athens, are illustrations of historical and mythical legends connected with Greece. They begin with the tragedy of PROMETHEUS. M. LOTZ sends sketches of some of his works in the museum at Buda-Pesth, one being *The Propagation of Christianity among the Hungarians*. Another artist who has been commissioned for many works in Buda-Pesth is Herr MAURICE THAN, and his *King Mathias Corvin surrounded by Artists and Scholars*, and *History of Civilisation in Hungary*, will sustain a comparison with any of the works from Western Germany.

The monumental art of Belgium would command attention if it depended solely on the works of M. GODEFROID GUFFENS, of Brussels, who has carried out more commissions for wall-painting than any other artist now living. It is hardly necessary to describe the character of his style, for illustrations of most of M. GUFFENS' paintings have been published in *The Architect*. But no print in black and white can do justice to a painting which is finely coloured, and students of monumental art will do well to consider M. GUFFENS' works on the walls of civil buildings and churches in Antwerp, Ypres, Courtrai, Louvain and Liège. His style is well adapted to paintings of that kind. M. GUFFENS has no archaeological affectations, he never attempts to paint in the manner of an illuminator of a missal. But he spares no pains to be accurate in details of costume, using that word in the widest sense, and his work is therefore sure to be more appreciated in the course of time. In one of the churches of Antwerp some of his paintings have suffered through a defect in laying on the plaster, but elsewhere we have found his colours to retain their original brilliancy. For the decoration of ancient buildings it would be difficult to find better models than the paintings of M. GUFFENS.

The Belgian Government have recognised the skill of M. JOSEPH GERARD in historical painting, and copies of his designs have been obtained in order to serve as an aid to the writings of historians for colleges and schools. His drawings of *The Early Days of Christianity in Belgium*, and *The Epoch of the Dukes of Bourgogne*, have the true spirit of historical painting in severity of style and fidelity to archaeology. The drawings exhibited by M. GERARD denote the importance which is attached to the past by the Belgian Government. If the English Exchequer were overflowing with money, we could not imagine a part being assigned for the production of large etchings of historical events.

M. HENNEBICQ, of Brussels, is more fortunate than most exhibitors, for he is able to show paintings as well as designs. His work is intended for the town hall of Louvain, a building which is rich in statues of the burghers. It was designed about the middle of the fifteenth century. M. HENNEBICQ shows panels containing figures of the three artists whose names are most closely associated with the building. The first is MATHIEU DE LAYENS, the architect, who is represented drawing his plans; JEAN BEYART, the sculptor, is shown at work in the second painting; and in the third we see MARIE VAN BELLE, a calligraphist and miniaturist, who had charge of the painted decoration of the building. It is better to see representations of artists than of the nobles who held sway, and whose tyranny brought about the ruin of Louvain, but in England a different rule is observed. Another painting by the artist represents ANTOINETTE VAN ROSEMAEL, one of the early reformers, expounding the Scriptures; but still larger is M. HENNEBICQ's *Translation of the Corpse of Burgomaster Vanderlyens to Louvain in 1379*. This painting, from its vigour, dramatic power, and colour, would seem to be the work of an artist of the Antwerp school—a school, we may remark, that is not represented in the Exhibition. In 1378 there was an insurrection in Louvain, and many of the nobles suffered for their misdeeds. Then the town was besieged and taken by Duke WENCESLAUS, who exacted severe penalties. The burgomaster went to Brussels to explain the misery of his fellow citizens, but he was murdered on the way by the patricians. The scene depicted by the artist is the arrival of the body of the patriot. The canvas is crowded with figures who are all

in a state of excitement. The picture gives a vision of Mediæval life which an historian could never realise by the aid of words, and it is always surrounded by a crowd.

M. CARDON is an artist who is in much favour with the authorities of Belgium. He has mastered Gothic detail, and no more suitable decoration for an old building could be found than his work. M. CARDON is a fine colourist, and may be said to be an indispensable aid to the architect in restoration. All the exhibits are sketches of his decoration of the Salle des Mariages in the Brussels town hall. In Belgium M. CAPRONNIER stands at the head of the glass-painters. He sends a cartoon of one of his windows in the cathedral of Brussels, which he designed in 1848.

M. DELL'ACQUA, of Brussels, has been commissioned to paint an allegorical picture for the Hôtel de Ville of Trieste, and a photograph of the council chamber suggests the fitness of the picture for its position. The tapestry of Messrs. BRACQUENIE, of Malines, can compete with the products of Governmental looms. It depends for success not merely on the quality of the fabric, but for the design, which is always supplied by artists. The designs by M. GEETS are good samples of those preferred by the firm. The archaic style of the late Baron LEYS, which has helped to create Mr. ALMA TADEMA's Roman scenes, is suggested by the photographs from the frieze in the dining-room of the artist's house. The subject is a sort of Seven Ages of Man, but the figures belonging to the periods are mixed together. M. STALLAERT exhibits a great many sketches, but they are hardly a tithe of his commissions. An artist who was chosen to decorate the National Gallery of Brussels, the palace of the Comte de FLANDRE, the Banque Nationale, must have had a high reputation. M. STALLAERT's work is characterised by a lightness and brilliancy which can rarely be found outside Paris, and it differs from much of the decorative work which is executed in Belgium.

The French decorators evidently believe that art should, above all things, give pleasure. Sermons and didactic discourses can be had without the help of the painter, and there are tragedies enough in the world which find record without being perpetuated on canvas. In the series from the Mairies of Paris, of which photographs are in the Exhibition—copies of the works have also appeared in this journal by the favour of the Municipal Council—it will be found that the artists all take a favourable view of life. Even in scenes of toilsome labour there is nothing suggestive of pessimism. There is in consequence a vast difference between the monumental art of the French and the Germans. The latter are the conquerors—some will say they are the foremost people in the world. But their pictures do not suggest a day when the warrior can rest under his fig tree. Everything serves to remind the German of unending struggles. The hydras we see in Herr GESELSCHAP's cartoons seem to have the knack of coming to life again and must be met with fresh weapons. The French pictures, on the contrary, are mainly of peaceful subjects, and if war is suggested it is in the form of self-sacrifice.

Nearly all the great decorators are present, and by a curious coincidence the works they have sent are generally those which they had given for publication in *The Architect*. Thus M. PUVIS DE CHAVANNES has the pictures from the Panthéon, the *Pro Patria Ludus*, or *Young Picards Exercising with the Lance*, in the Musée d'Amiens, and the *Doux Pays*, which was a present to M. BONNAT, the portraitist. But as the colouring is as characteristic of the artist as his drawing, the cartoons are insufficient to convey a clear notion of his style. An etching of M. JEAN PAUL LAURENS, by M. FLAMENG, does not suggest the character of the original or its sombre power. It will, however, serve as a diagram to explain the positions in the painting of the wonderful studies for the figures which the painter has lent to the Exhibition. The world of fashion is rather afraid of M. LAURENS, but, in spite of neglect, he sets an example of hard work which is almost without parallel in these days of rapid production. In the Exhibition there are no less than fifty-seven studies in oils for the picture in the Panthéon. They are not blottesque daubs, but as finished as if they were intended to be handed over to assistants for reproduction, although, it is needless to say, M. LAURENS does not adopt that mode of execution. These studies should be secured by the Ministry of Fine Arts, for the sake of the lesson they can impart.

M. MAZEROLLES'S work has the qualities which are accepted as essentially Gaulish. He possesses fancy, and a hand light enough to realise his most dainty conceptions. What can be more charming than his *Fairies' Goddaughter*, which was designed for the Gobelins factory? Our readers will remember, from the illustration we published, how in it the fairy world is seen to guard an infant and drive away the wicked spirit, while genii carry their gifts for use. But it is generally believed that originally the child who was under the protection of fairy-land was the late Prince Imperial of France, whose fate did not get him immunity from misfortune. In the ceiling painting of the Comédie Française the design is contributed by M. MAZEROLLES. It is masterly in arrangement, for while the characters of RACINE and CORNEILLE are above this nether world, the men and women of MOLIÈRE are on solid ground. The commission came from M. PERRIN, who was at one time a fellow pupil with the painter. Another work for the theatre is the sketch for the drop scene in the theatre of the Arts Club of Paris, which recalls Arcadian days.

In a very different style to the foregoing is M. FLAMENG'S *Abelard and His School on the Hill of St. Genévieve*. The influence of M. PUVIS DE CHAVANNES is seen in the flatness and sober colour of the work, but unfortunately the painter has not been able to realise the life of the Quartier Latin in ABELARD'S time. The unlucky dialectician was compelled to lecture in improvised academies which his followers erected, but Paris could at least afford him a shelter of some kind. With all his heresy, it was not necessary to teach in the open air. Master and scholars have necks as long as the mysterious ladies in ROSSETTI'S pictures, but not a trace of intellectualism is to be seen in any face. Evidently M. FLAMENG went to the Halles and made philosophers of the porters. The picture is striking, unforgettable, but the professors of the Sorbonne are likely to find more pleasure in the picture of a gleaner by another artist.

The pictures in the Mairies of Paris, which are shown by the aid of photographs, do credit to the Municipal Council as well as to the authors. What city can show so many high-class works ordered at the same time? Paris deserves to hold the first place in art when it has patrons in office like the present Council. It would be difficult to discriminate between the works. Given a Salle des Mariages to decorate, the painters have interpreted the problem each in his own way. M. GERVEX is realistic, M. EMILE LEVY is idyllic, the late M. BOULANGER makes it suggestive of ancient Rome. It is the same with other scenes. M. BAUDOIN makes labour in the fields appear a pastime, just as M. BLANCHON confers dignity on the coal porters of La Villette. M. MOREAU DE TOURS gives the air of an antique priestess to a woman who approves of her husband becoming a warrior. The pictures show how art can ennoble the humblest scenes. It would be interesting to learn what one of the German decorators must think of the French decorations. Habit and prejudice count for much, but he would have to own that in monumental art the French painters are still pre-eminent.

### LINE-ENGRAVING ON METAL.\*

BY SIDNEY COLVIN.

IN line-engraving the method is the reverse of that used in wood-engraving, inasmuch as the lines intended to print black are not left standing in relief, but are sunk or ploughed into the surface of the substance employed. The design to be reproduced is first transferred by tracing to the surface of a metal plate: the engraver then proceeds to incise with a sharp instrument on the plate the outlines and details of his design, and to add shading by means of systems of lines similarly incised, and varying in depth, direction, and distance from one another. In the case of lines thus incised, the method of obtaining effects of shade by cross-hatching offers no difficulty, and is adopted as a matter of course. The metal usually employed in line-engraving is copper; but in the early stages of the art other metals were occasionally used, as silver (and in a few instances gold), iron, and brass, and about 1820-1830 the use of copper was gradually superseded by steel, which from its hardness is capable of yielding a greater number of impressions. When copper is now used, it is customary to face the plate

with a thin coating of steel before printing. The instrument chiefly used in line-engraving is the graver, or burin, a tool having a sharp triangular point, and driven by the engraver point foremost, so as to plough out a clean furrow in the metal as it goes. Pure or unmixed graver-work is comparatively rare; some of the earliest masters of the art having apparently worked rather in the manner of dry-point, *i.e.* with an instrument held like the pen or pencil in drawing; while the method of etching the main lines of the composition, *i.e.* biting them in with acid, has been almost universally employed by the later. When the work of incising the design upon the metal is complete the plate is inked, and then carefully cleaned so that the ink remains only in the incised lines; impressions on paper are then taken by means of a press of special power, by which the paper is forced into the incised lines, and takes off the ink with which they are charged.

According to the generally accepted, but questionable, account, impressions from metal-plates on paper were first taken by the Florentine goldsmiths about 1450 for the purpose of testing the look of their designs in niello-work\* during progress. All that is certain is that about or rather before that date the art began to be practised for this purpose among others. Alike in Germany and Italy (it is uncertain which country had the precedence) it came increasingly into use during the third quarter, and still more during the last quarter, of the fifteenth century, for the production of images of saints, Bible figures, and other devotional subjects, emblematical, mythological, and satirical pieces, scenes of daily life, patterns of ornament, and occasionally also portraits. From its nature the craft partakes of, and as it were stands midway between, those of the painter and the goldsmith, which were themselves often in those days united in the same hands. Several of the greatest artists of the fifteenth century took it up. As a general rule, the early engravers worked from their own designs, and were not merely mechanical interpreters of the designs of others. It is difficult to divide the history of line-engraving into fixed periods, as it neither passed through any such time of abeyance, nor underwent any such radical change of method as wood-engraving. But after the fame won by Marcantonio with his engravings from the designs of Raphael (about 1510-1520), it gradually ceased to be an art of original expression, and became, first in Italy and afterwards in other countries, exclusively an art for interpreting the works of others. As such its practice passed out of the hands of the great original masters into those of specially-trained craftsmen, and its progress thenceforth simply reflects the general movement of art history and of taste.

In our exhibition impressions from niello plates and other experimental varieties of the art in its earliest stages are not given. The series begins with the comparatively mature work of the German and Italian masters about 1480. First, two of the beautiful devotional subjects of Martin Schongauer, the great master of Colmar, in Alsace, whose influence extended towards the close of the fifteenth century over all the schools both of Upper Germany and of the Rhine; and next a copy of the same master's most famous engraving, *The Death of the Virgin*, by Albrecht Glockendon, of Nürnberg. A somewhat younger engraver of the same period, who worked at Munich in a distinctive fanciful manner of his own, was the so-called Martin Zsinger, signing with the initials M. Z.; he is represented by one allegorical, one pastoral, and one legendary subject. We then pass to Italy, where the engraver's art was practised with less technical skill, and with a much simpler method of shading, than in the North, but in many cases with admirable grace of feeling and force of artistic expression. The Florentine school is represented by one of the illustrations to the famous Dante published in 1481, the designs for which were derived, with much modification, from the compositions of Sandro Botticelli, while their execution is traditionally associated with the name (which modern research threatens to render mythical) of Baccio Baldini. The bold and masterly manner of Andrea Mantegna, the greatest engraver, as he was all but the greatest painter, of North Italy, is illustrated by a single example; Jacopo de' Barbari, who belongs half to Venice and half to Germany, and adds to his Italian grace of design a Northern technical elaboration and richness of shading, by three. Albrecht Dürer, several of whose early plates were executed in express rivalry with Barbari, follows next with a group of devotional pieces, and the two famous allegories, the *Knight and Death* and *Melencolia*, which may be regarded in some ways as the central works of his life. Not only intellectually but technically (according to the severe methods of the art in its early age) Albrecht Dürer is the greatest artist who ever practised engraving. Only second to him among the Northern schools, at least in sincerity of aim and manual skill, comes Lucas van Leyden. The attempt of this Dutch master

\* From the new "Guide to the Exhibition Galleries of the British Museum."

\* A "niello" is a plate of silver on which a design of figures or arabesques is engraved, and which is then finished by filling in the engraved lines with a black mixture (Latin "nigellum," whence niello) the better to show off the design.

to express aerial gradation in landscape by means of lines of gradually increasing delicacy was new in his day. From Holland we return to Italy, where several engravers in the early years of the sixteenth century had been in the habit of copying, with their own simpler and more primitive mode of handling, the compositions of the Northern masters. The first Italian master to acquire the true Northern strength, precision, and suppleness of stroke with the graver was Marcantonio Raimondi. Working in youth from the designs of Francia, and presently farther training his powers of hand by copying the work of Dürer, Marcantonio from about the year 1510 applied the skill he had thus acquired almost exclusively to reproducing the designs of Raphael. His practice was to work up the sketches of that master into finished designs, adding to them landscape or architectural backgrounds, sometimes taken direct from Northern examples, but without the characteristic Northern crowding of detail. Two examples represent the classic, and one the devotional, class of Marcantonio's engravings after Raphael.

From about 1520 till near the end of the century the art of engraving was almost wholly dominated by the traditions of Marcantonio and Dürer. The example of the former prevailed absolutely in Italy; a mixed method, combining an attempt at Italian grace of design with Dürer's technical precision and fulness of detail, in the North. A succession of masters, working in great part from designs furnished by the scholars of Raphael, carried on the traditions of Marcantonio at Rome, Venice, and Bologna, in a cold and mannered, but often truly learned and accomplished, style. The engravers who in Germany chiefly worked under the combined influence of Dürer and Marcantonio are the group known, from the minute scale on which they commonly worked, as the little masters, comprising Albrecht Altdorfer, of Ratisbon; Barthel Beham, Hans Sebald Beham, and George Pencz, of Nürnberg; Jacob Binck, of Cologne; Heinrich Aldegrever, of Soest, in Westphalia; and several others known only by the monograms they appended to their works. Of these, H. S. Beham, Binck, and Aldegrever are represented by a number of characteristic examples in the several fields of classic and devotional design, daily life, portrait, ornamental design, and heraldry. Passing to France, where the art of engraving took root later than in Germany and Italy, we find the spirit of the early French Renaissance well exemplified in the series of small designs by Etienne de Laune, imitating the manner of the little masters with a new French lightness and sprightliness of touch; and also in the religious compositions of Jean de Gourmont, whose minute groups of figures, borrowed more or less closely from the Italian, are set in fine architectural surroundings of the artist's invention. All the above masters, German and French, engraved for the most part their own designs, and in their hands engraving is still an original art, partaking of the character at once of painting and of goldsmith's work. But going back to Italy, we find the art of line-engraving practised by Agostino Carracci and his master Domenico Tibaldi, at Bologna, exclusively for the reproduction of pictures and with much loss of the precision (although none of the pretension) which had characterised the immediate followers of Marcantonio.

Meantime, in the schools of Flanders and Holland, severe and minute accuracy and brilliant decision of line, in the spirit of Dürer and Lucas van Leyden, were still aimed at by the Amsterdam engraver family of Wierix, working chiefly on subjects of their own invention, and to a lesser degree by Adriaen Collaert, in interpreting the painting of the Italian schools, and by Hendrik Goltzius. Our example of the last-named master belongs to his early time, when he used to invent and engrave great compositions under the influence, and in what was intended to be the manner, of Lucas van Leyden. Later he carried to an extravagant pitch the florid imitation of Italian work to which all the artists of the Netherlands gave themselves over in the third and last quarters of the sixteenth century. For the present we do not follow this development of Flemish art, but cross, with a family of Low Country artists who adhered to severer methods, to England. These were the Van de Passe family, who settled here towards the close of the reign of Elizabeth, and whose work, especially in portrait-engraving, seems to have given a direct impulse to other engravers in England, such as Elstracke (himself of Dutch birth), and Rogers, specimens of whose careful but somewhat primitive craftsmanship are now rare and highly valued. From these we return to examples of German portrait-engraving as practised in a vigorous but still severe manner lineally derived from that of Dürer, by seventeenth-century masters like Lucas Kilian, Peter Isselburg, and Joachim von Sandrart. Closely allied to these, though trained first at home and afterwards in France, is the great English portrait-engraver of the Commonwealth and the Stuart period, the first really accomplished master of his art in our country, William Faithorne, whose portrait of Charles II. is expressly placed for comparison beside that by Sandrart.

At this point in the progress of the art a somewhat sudden

change in its character is noticeable, a change due to the influence of a single great master, Rubens. For the reproduction of his paintings and those of his school, Rubens gathered about himself and trained a group of engravers, who under his inspiration discovered new resources in the art, and in imitating his exuberance of line and brilliant play of colour-surface, learnt to handle the burin with a new freedom, energy and variety. The chief among these engravers were Scheltius à Bolswert, Paulus Pontius, Peter de Jode father and son, and Lucas Vorsterman father and son. It was their method to use etching freely for the outlines and preliminary work of their plates, the brilliant skill of Vandyke as an etcher helping greatly to stimulate them in the practice. Scheltius à Bolswert is represented with a Holy Family after Rubens and a scene of *bourgeois* jollity after Jordaens; Paulus Pontius with two of his best portraits after Vandyke and Rubens; Peter de Jode the younger with a New Testament piece after Rubens and a portrait of Henrietta Maria after Vandyke; Lucas Vorsterman the younger with the portrait of Gertrude van Veen. In the meantime other masters of the Low Countries, settled chiefly at Rome, were continuing to work according to colder academic traditions in the interpretation of Italian or Italianised-French pictures of the decadence, as for instance Cornelis Bloemart of Utrecht and Michel Natalis of Liège.

In France, until after the first half of the seventeenth century, the great popularity of the art of etching, as practised by two very dissimilar masters, Jacques Callot and Abraham Bosse, caused that of line-engraving to be relatively neglected. During this period, however, Michel Lasne, of Caen, worked in a fashion somewhat stiffly approaching that of the school of Rubens; and Claude Mellan with a great if somewhat mannered and affected skill of his own. This master avoided cross-hatching, and expressed form and shadow exclusively by the flow, direction and varying depth of single lines—a practice in which he was imitated almost to deception by the German Thourneyser. A little later in the same century, under the magnificent and masterful patronage of Louis XIV. and Colbert, Paris, or more strictly the Gobelins, became the home of a school of engravers perhaps the most powerful and accomplished in the whole history of the art, though too much of their industry was unluckily devoted to reproducing the vast and tedious compositions in which the painter Lebrun commemorated the glories of his master. First among this school comes François de Poilly, who brought back from Rome a skill in rendering the works of the later academic schools of Italian painting which exceeded that either of their own countrymen or of the Flemings; his work should be compared with that of a somewhat younger member of the same group, Roullet. This famous school is further represented by Gérard Audran, the most original and inventive in touch and method among all its members, with his *Triumph of Truth* after Nicholas Poussin; by Robert Nanteuil and Antoine Masson, with examples of their incomparably powerful, brilliant and yet sober work in portrait-engraving; and by Gerard Edelinck—a Fleming who brought to Paris the best traditions of the school of Rubens—with his portrait of Dryden after Kneller, and his splendid rendering of the group copied by Rubens from Leonardo's lost *Battle of the Standard*. Later in the same century, the stately traditions of Lebrun and Mignard in French art gave place to a more florid, if scarcely less pompous, fashion under the influence of the painter Rigaud, who found his best interpreters in the members of the engraver-family of Drevet: see his own portrait engraved by Pierre Drevet, and his celebrated full-length of Bossuet, now in the Louvre, by Pierre-Imbert Drevet the younger.

During the greater part of the eighteenth century the French school of line-engravers continued to be beyond dispute the leading school in Europe, while at the same time its aims became more varied and its ideals lighter. Along with sacred and heroic subjects and portraits, which had hitherto almost exclusively occupied it, came in familiar scenes after the Dutch painters, landscape subjects after Claude and his imitators, court pastorals after Watteau and his school, *bourgeois* interiors after Chardin, mythologies after Boucher, and dramatic and sentimental compositions after Greuze. Philippe Lebas included in his multifarious work examples of nearly all these varieties of art, but was especially devoted to the interpretation of Dutch *genre* pictures; Wille, a German whose working life was almost entirely spent in Paris, to *genre* and portrait. Daullé, while in portrait he carried on the traditions of the Drevets, was also an engraver of landscape; while the landscapes of Joseph Vernet employed a great part of the industry of Balechou, who, however, is here represented only by his somewhat pretentiously brilliant and adroitly handled plate of Ste.-Genéviève, after Van Loo. François Vivarès was a landscape-engraver almost exclusively, who, not succeeding at first in his own country, came young to London, where he found a ready market for his plates after Claude Lorrain, Gaspar Poussin, Joseph Vernet, and Patel. Next to these masters in our exhibition comes C.-N. Cochin the younger, with two of his admirable renderings of the pleasant and quiet

*bourgeois* art of Chardin. The *St. Cecilia* of Bernard Baron, after Carlo Dolci, is one of the best works of an engraver of French origin, who during the latter part of his career found employment and a home in England. Next follows an example of work purely and energetically English, in Hogarth's rendering of one of the subjects in his own series of the *Rake's Progress*.

Returning, after a long interval, to Italy, we find the academical traditions of Bologna and Rome still carried on, about the middle and through the latter half of the eighteenth century, by Cuneo and Volpato. These engravers had the merit of addressing themselves in great part to the reproduction of the pictures of the two great masters, Raphael and Michel Angelo; but their work, facile and industrious as it was, fell short alike in true technical skill and in delicacy of appreciation for the originals. In the meantime our own country began for the first time to take a leading place in European esteem for skill in the art of engraving. Robert Strange, a native of the Orkney Islands, trained first in Edinburgh and then in Paris, under Lebas, devoted himself to the reproduction of the classical masterpieces of Italian and Flemish painting; equalling the best engravers of his time in fidelity to the spirit and expression of his originals, while he surpassed them all in delicacy of finish and refinement of flesh-modelling. He is seen to most advantage in his plates after Correggio, Titian, and Vandyke. He had to fight his way against unscrupulous rivalry and opposition, but in the end won recognition and honours. At the same time, the Kentishman, William Woollett, followed up the example set by Vivarès, and, using all the resources of the etching-needle and the graver in combination, carried the art of landscape-engraving to a higher point of power and skill than it had yet reached, achieving a great and just popularity with his reproductions of the works both of Claude and of native masters, particularly of Richard Wilson. He also worked with originality and spirit in the fields both of history and portrait. Next to the work of this strenuous and sturdy Englishman come two heads, engraved with a characteristic flowing and facile prettiness by Bartolozzi, an Italian who came to England about the middle of the eighteenth century, and founded a school of engraving at the time (and now again once more) very fashionable. The nature of his work and influence we shall see more fully later on. The manner of the poet-artist, William Blake, when he was engraving not for his own pleasure from his own designs, but to order from the works of other people, is illustrated in the sober and workmanlike portrait of Lavater, and the wild and wildly-executed head of Satan after Fuseli. Another mystic, William Sharp, next to Strange and Woollett the most accomplished English line-engraver of the time, is represented with the portrait of Dr. Hunter, after Reynolds; Sherwin, a successful follower of Strange, with portraits of Reynolds and of Woollett.

Passing now to the Continent, we find the art practised in Germany skilfully, if somewhat drily, from the third quarter of the century onwards, by Bause, whose subject after Reynolds had not then been engraved by any English artist; and Klauber, who learnt his art under Wille at Paris, and here is represented with a Cupid, after Van Loo. A more powerful pupil of Wille was J. G. von Müller, of Stuttgart, the oldest in years, and one of the strongest, of those academical engravers who represented, towards the close of the last and in the first decades of the present century, the general reaction of the mind of Europe against the levity of the preceding age, and the reviver of a severer and more classic taste. The work of the leading masters of this age is illustrated in our exhibition by proof engravings of great perfection. Their common fault is a certain tendency to academical pretentiousness, and a proneness to set more store (the besetting sin of this art throughout its later history) by technical ingenuity of handling and brilliancy of effect than by fidelity to the finer qualities of the original before them. Italy produced the greatest number of such engravers; and first among them the Neapolitan, Raphael Morghen, a pupil of Volpato, whose fame was great in his own time and since, but whose work is hardly as excellent in its kind as that of his friend and pupil Longhi. Longhi established himself at Milan, where he was the head of a school from which issued several distinguished masters, among them Anderloni. Other contemporary Italians received their training not in Italy but in France; as, for instance, the adventurous traveller Mauro Gandolfi, of Bologna, who worked with Bervic in Paris, and also with Sharp and Bartolozzi in England, before he tried his fortunes at his native town and Florence. Another and justly famous pupil of Bervic was Paolo Toschi, who, having begun with some fine renderings of the most popular pictures of Raphael, by-and-by established himself at Parma, and founded a school of engravers devoted to the reproduction of the great series of decorative paintings by Correggio in that city; a school whose labours were continued after the master's death, and are not yet completed. Among French engravers contemporary with these Italian, and aiming at similar qualities and effects, we have already mentioned Bervic, who is represented by a vigorous rendering of the antique group of Laocoon.

Equally marble-like in effect, and therefore exaggerated in relation to the original, is the engraving after the loveliest of Raphael's monochrome fresco decorations in the Stanze of the Vatican, by Boucher-Desnoyers. Desnoyers was the most famous of all French engravers, from the days of the first to those of the second Empire: the same master is better represented by his *St. Catherine*, after the picture of Raphael now in the National Gallery. His contemporary, Lignon, comes as our last representative of the school, with a fine rendering of Raphael's portrait group in the Pitti.

Going back to England, we find no school similar to those of Germany, Italy, and France existing here in the period between 1790 and 1840. In spite of the distinction obtained in line-engraving by Strange and Woollett, Sharp and Sherwin, popular taste in this country towards the close of the last century ran almost exclusively in favour of the methods either of mezzotint or stipple; and line-engraving was little practised except on a small scale for the illustration of books and periodicals. One dainty example of the time is given in the print and flower-piece by the daughter of an engraver-family, Elizabeth Byrne. A considerable revival of line-engraving ensued, however, after the adoption of the new material of steel, between 1820 and 1830. Landscape and portrait, the forms of art most native to our race, were rendered in steel-engraving, the former especially, with a new and extraordinary minuteness of skill—a skill always too apt to degenerate into the petty and mechanical, but where the workman's hand was kept sensitive either by a special gift of nature or by the superintendence of a man of genius like Turner, yielding results admirable for beauty not less than craftsmanship. This skill is represented by one of the earliest and longest-lived of the masters who practised it, W. B. Cooke, with his small plate of *Pevensey Bay*, after Turner; by William Finden, the accomplished head of a school whose work by-and-by sank into the merely mechanical, with the well-known *Sheep-Washing*, after Wilkie; by J. H. Robinson, the chief portrait-engraver of the day, with the likeness of Sir Walter Scott, after Lawrence; and lastly by J. T. Willmore, with his admirable rendering—truly characteristic of the best work of the school—of Turner's *Oberwesel*.

## TITIAN AND REYNOLDS.

IN the course of a letter to the *Times*, Sir J. C. Robinson states that experiments with regard to oil-colours were made concurrently with those detailed in the report on water-colours. Referring to Titian and Sir Joshua Reynolds, two of the greatest oil-painters the world has seen, he writes:—

Both these great artists were reckless workmen, solicitous only for the attainment of the utmost brilliancy, power, and perfection of colour, tone, and texture in their works, at no matter what cost as to prospective durability. Sufficient for them was their own glorious day, the evil thereof being cast on the shoulders of posterity. They were continually experimenting, eagerly trying every new colour, vehicle, and process, even the most incongruous and obviously perishable; happy if only richer and more glorious hues could be put upon canvas for the day even, if they visibly waned and faded under their eyes on the morrow. Titian's practice in his later time—for these animadversions do not apply to his earlier works—was, in fact, as bad and unreasonable as it well could be. Unfortunately for a long time Sir Joshua copied it; Titian, indeed, was the Gamaliel at whose feet he sat. So infatuated was the great English artist that he seems even sometimes to have regarded as beauties and qualities to be aimed at, obvious evidences of imperfection and physical decay in the idol he worshipped.

Titian's works were, it is true, produced some two hundred years earlier than Sir Joshua's, and a considerable percentage of his very numerous pictures have doubtless perished from unavoidable accidents, but of those that remain the majority even are now but blackened and enfeebled souvenirs of once inimitable perfection. Even of his celebrated masterpieces in great galleries, many would now be but little heeded by mankind were it not for the enduring magic of his great name and prestige.

An entire class of Sir Joshua Reynolds's portraits, on the other hand, exists, which, from their faded and damaged condition, have now but little attraction for the picture collector, and which, while his well-preserved and brilliant pictures are every day commanding more and more extravagant prices, are a drug in the sale-room, and literally almost valueless. These are mostly the pictures of the artist's earlier period, when he was most strangely influenced by Titian; and it should be noted that a period arrived in the painter's practice when he found out the mistakes he had made. He then threw over the luminary and leader of his early years, and sought another guide among the great "old masters," who in that early age of English art were deemed the indispensable and unapproachable models—the only true mirrors and interpreters of nature. In Sir Joshua's more mature period, Rembrandt became, in turn,

the prime object of his worship and imitation, and the Dutchman more or less completely dethroned and superseded the great Italian.

Rembrandt, it must be said, was a far more helpful guide in all matters of technical skill and insight than the earlier master. He, in fact, directly inherited and carried to their utmost perfection the sound and healthy methods of oil-painting which had sprang up in his country, complete and perfect from the very beginning, in the hands of John van Eyck and his immortal contemporaries, more than two centuries earlier.

This perfect *technique* the Italians probably never possessed in equal measure, and it is perhaps not too much to say that oil-painting was never fully acclimatised in Italy. From first to last, in fact, the Italians groped and experimented, often swayed backwards and forwards by the influence of early and different modes and processes which had rooted themselves too firmly to be ever entirely superseded. From Italy, indeed, first proceeded those evil processes and doctrines which ultimately invaded all art practice, even that of the Flemings and Dutchmen themselves.

As regards the bleaching influence of light on oil-pictures, it may be noted that we have no blanched and faded Van Eycks or Rembrandts, yet it is certain that of the pigments employed by them, many were of a fugitive nature; the colours, in fact, were the same as those now in use, permanent and impermanent colours being, as at present, indiscriminately made use of. But the vehicles, the oils and varnishes with which these colours were mixed and tempered, were more carefully selected and prepared, more congruous in mixture, and more intelligently and scientifically applied by these old artists than by their modern successors.

It may, indeed, be taken as fact that when pigments, applied in sufficient body, are well and safely locked up in an oleo-resinous medium, and still more when they are additionally protected, as in pictures, by numerous coats of surface varnish, there can be little or no fading from light; for the atmospheric air, or rather the oxygen contained in it, which we have now discovered to be the all-potent enemy, cannot get access to the particles of colouring matter, completely enveloped and protected as they are by a transparent medium upon which it has no power to operate.

There is, moreover, a curious incidental protecting process, which doubtless sometimes operates in oil-painting, and may in some cases even exercise a considerable preservative influence; it is in the fact that the oils and varnishes employed in the execution of the picture, and the surface varnishes sooner or later superadded, always in the long run darken and acquire more or less of yellow and brown hues. It is this darkening, the effect of carbonisation, which gives the rich golden glow which is often a positive charm in the case of ancient pictures. Now, the golden hue in itself is a barrier to the enemy, for the light transmitted through it is of the particular colour which does not, or at least only in the feeblest manner, give rise to the action of oxygen.

## TESSERÆ.

### Saxon Architecture.

W. BURGESS.

INCIDENTAL pieces of architecture occur in the Anglo-Saxon MSS., in which the British Museum is so rich. It is true that they are generally ill-drawn, but still they show us enough to enable us to draw very valuable conclusions as to what Anglo-Saxon architecture really was, and to refute the generally conceived idea that both architecture and history began in England exactly in the year 1066. Mr. Wright has contributed a most interesting paper on this subject in the "Transactions of the Archaeological Institute," vol. i. In it he shows that the triangular arches and the baluster shafts, which are now recognised as Anglo-Saxon features, occur equally with representations of domes and carved pinnacles (not crocketed), and ironwork, which antiquaries are generally unwilling to acknowledge as belonging to the time before the Conquest; as if the countrymen of Alfred and Edgar, both great and powerful kings, should have been unable to carve a capital or use a chisel, when they were renowned all over the world for their manuscripts, jewellery, and embroidery. I suspect the fact is, that the history of architecture has hitherto been written in far too scientific a manner; and because the art exhibits a general progress and decline, people have believed that sundry processes were unknown at certain periods, when in fact almost all the essentials of building have remained the same throughout all ages. Thus, because Gervase says that the work of the old cathedral of Canterbury was done with an axe and the new with a chisel, we are to suppose that the Saxons had no chisels and no carved ornaments. Now the MSS. distinctly show us elaborate capitals which must have been done with a chisel, and no one can for a moment imagine that so useful and

obvious an instrument could ever have been lost, even in the most barbarous countries, much less so among the civilised Anglo-Saxons.

### Accuracy of Representation in Painting.

R. REDGRAVE.

All incidents occurring in real life are successive in their action, while the painter, by the nature of his art, is confined to a momentary representation of the incident chosen. In the succession of events tending up to the moment when we have conceived the action to be fixed in the reflective glass, some points before, some after the culminating act, have, no doubt, tended to heighten the pathos and to increase the interest. Are such to be overlooked, or may the painter be allowed to gather them in, from their succession in the course of time, to the definite moment he is about to represent for us? The painter's art also of necessity implies a spectator, and requires such a disposal of the details of the action to be represented as will best bring the various points before the eye of such spectator, and, while naturalness and individuality should not be overlooked, may such an arrangement as best tends to bring out all the details be permitted to the painter? The painter can only speak to the eye, and must in a great degree render the qualities of the mind by nobleness of aspect or dignity of action. St. Paul said his personal appearance was mean: is the painter of any incident in the life of the apostle to the Gentiles so to represent him—to be strictly faithful to this description? Is it desirable to picture virtue, modesty, or truth by loveliness of exterior, or should we be equally interested in these virtues if their possessor is shown to us as ugly or ill-formed? Professor Green, in his Academy lectures, used to take very high ground on this point, and to say that the painter or the sculptor might, by their art, give us a much truer personation of Socrates than if we verily saw the great heathen philosopher; and Socrates himself seems to bear indirect testimony to this truth in his reply to one who expressed disappointment at his personal exterior. Again, everything in a picture should be in harmony with the event described. Yet it is hardly to be expected that Nature will sympathise with every event. Terrible deeds happen when the sun is shining and Nature arrayed in smiles; in such a case it would seem that the painter's art was best exhibited in enhancing the terrors of the scene by showing the elements in greater harmony with the event. These remarks refer to scenes in real life or in contemporary history to which I limited my observations in the first instance. What will be the course when the event chosen is from poetry, fiction, or when, from remote antiquity, it has to be realised on canvas to a race of a wholly different civilisation, feelings, institutions, or manners? There may, as we have seen, be reasons for a departure from the literal representation of an action which took place even before the painter's eyes, or known to his immediate contemporaries; and even in these instances the literal reflection of the scene already alluded to might not be the truest, as it would hardly be the most artistic. But in treating the great events of past ages, much more the relations of poetry or fiction, great latitude taken by the painter may be used so as to bring home to us the truths of history, or the inventions of poetry, far better than a more literal rendering.

### Style in Sculpture.

SIR M. D. WYATT.

In what are generally understood as styles in the history of art, such as the Grecian, the Roman, the Gothic, the Renaissance, &c., may be recognised deeply interesting accumulations of experience concerning the nature of men's intuitive affections for certain concatenations of form. Styles are usually complete in themselves; and, though not of uniform excellence, are still generally concordant among all the various members that compose them. Whatever may have been the dominant form in each, or whatever the favourite set of ratios, proportion usually pervades each whole monument, as it may be generally traced in a few detached mouldings. Styles, therefore, may be regarded as store-houses of experiments tried, and results ascertained, concerning various methods of conventionalising, from whence the designer of the present day may learn the general expression to be obtained by modifying his imitations of nature on the basis of recorded experience, instead of his own wayward impulses alone. Canova, Gibson, and many of the greatest masters in art, held and hold the creed that nature, as developed in the human form, can only be rightly appreciated by constant recurrence to, and comparison with, the conventionalities of the ancient sculpture of Greece. Mr. Penrose has shown us what beautiful illustrations of optical corrections in line may be gathered from the study of her architectural remains. Mr. Dyce, who has made himself deeply acquainted with ancient styles, thus expresses himself on the subject:—"In the first place," he remarks, "the beauties of form or of colour, abstracted from nature by the ornamentist, from the very circumstance that they are abstractions, assume in relation to the whole progress of the art the character of principles or facts, that tend, by accumulation, to bring it to perfection. The

accumulated labours of each successive race of ornamentists are so many discoveries made—so many facts to be learned, treasured up, applied to a new use, submitted to the process of artistic generalisation, or added to. A language and a literature of ornamental design are constituted; the former of which must be mastered before the latter can be understood, and the latter known before we are in a condition to add to its treasures. The first step, therefore, in the education of ornamentists must be their initiation into the current and conventional language of their art, and by this means into its existing literature." By this last passage we may fairly assume that Mr. Dyce would recommend first the study of the conventionalities of the student's specialty, and then as much as life is long enough to learn. The previous error in art education has been to grasp at so much vaguely and attain so little practically. The modifications which nature receives at the hands of the intelligent sculptor are so various, and frequently so subtle, that it would require a volume to enumerate them, and an Eastlake to write it. We can at present glance but at a very few. The first condition of the highest class of sculpture is, that it should be allied with the noblest architecture, to which it should serve as an inscription, explaining to those capable of reading its ideal expression those purposes of the structure which it is not in the power of architecture alone to convey. In all such cases fitness prescribes the subject—simplicity, its sublimest treatment—contrast, the general conditions of the lines of its composition. In order to give to his works that commanding language which speaks to the heart (the phonetic quality in Mr. Fergusson's admirable theory of beauty in art), the sculptor requires to select from his observation the expression of individual forms: those precise lines he learns from study and experience invariably convey the particular sensations it is his office to communicate to the mind of the beholder. It is by some such process that an approach was made by the Greek sculptors of old to attain an embodiment of their conceptions of divinity and the *beau idéal* in loveliness of form.

#### Time Occupied in Fresco Painting.

C. H. WILSON.

It is not difficult, in examining some frescoes, to ascertain the time occupied in painting them. In some examples the joinings by means of which this calculation can be made are distinctly visible; in others they are either so well executed, or are so concealed by the use of distemper, that it is very difficult to trace them. It is evident that the old masters painted with great rapidity; large and important works, judging from the following examples, were executed in a month or six weeks. The *Incendio del Borgo*, in the Stanze, seems to have been painted in about forty days; the group of the young man carrying his father has been executed in three days. The exquisite group of the Graces, in the Farnesina, by Raphael, has been painted, at most, in five days. The Cupid and the head of the Grace, with her back to the spectator, have occupied one day; the back and part of the lower limb of the latter figure, another. In this day's work the rest of the leg may have been included. There appears to be a joining across the knee; there was certainly one across the next; both these joinings do not follow outlines, but are in parts of the figure which are in shadow. It is, of course, better to cut by outlines; but this is not always possible, especially in very large figures. The Germans prefer cutting across a broad light when circumstances compel the artist to make a joining where there is no outline. The graceful composition called *Galatea*, also in the Farnesina, has been entirely executed in eleven or twelve days; the head and body of the principal figure have been painted in one day.

#### Windows in Ancient Irish Churches.

G. PETRIE.

In the windows of the ancient churches, which are always of a single light, the same simple forms are found which characterise the doorways; the horizontal head, however, so common in the doorways, is but of comparatively rare occurrence in the windows; while, on the other hand, the pointed head, formed by the meeting of two right lines, which is so rare, if not unknown, in the most ancient doorways, is of very frequent occurrence. The horizontal and triangular-headed windows are usually found in the south wall of the chancel, and very rarely in the east wall, which generally contains a semi-circular-headed window, the arch of which is often cut out of a single stone. In many instances the head is also formed of two stones, as in the east window of the oratory at Gallerus, built without cement. In the triangular-headed windows the pyramidal head is almost universally formed, both externally and internally, of two stones laid in such a manner as to form two sides of an equilateral triangle; these stones, like the lintels of the doorways, most usually extend through the entire thickness of the wall. In none of these windows, of whatsoever form they may be, does there appear to be any provision for the reception of sashes or glass; and it may be observed that no notice of the use of glass in the windows of the ancient churches is to be found in any of the old "Lives of the Saints"

or other Irish historical documents, although it would appear certain from Irish historical tales of an age anterior to the Anglo-Norman invasion that the Irish were not ignorant of the application of glass to such purposes. They seem, however, to have been unacquainted with the art of manufacturing it for windows, and it would appear from traditions preserved in many places that parchment was used as a substitute for glass, and other substances, such as horn, which no doubt would admit sufficient light for the performance of religious ceremonies in which candles were necessary. The windows, necessarily narrow externally, were invariably splayed internally to admit as much light as possible. There is one instance in which the window is splayed both internally and externally. It is found in the stone oratory built without cement, situated near the old church of Kilmalkedar, about a mile to the east of Gallerus, and is unquestionably one of the earliest ecclesiastical structures in Ireland. In these primitive structures the windows, like the doorways, are most generally without any architrave or ornament of any kind, and indeed this absence of decoration is a characteristic feature of the entire building. It is not altogether, however, the result of poverty and ignorance of the arts in their founders. Poor these honoured individuals unquestionably were, but that poverty generally, if not in all instances, appears to have been voluntary; but that they were ignorant of the arts, or insensible to their influence, could scarcely have been possible in men very many of whom—Romans, Gauls, and Britons—were educated where those arts, though they had become debased, were still cultivated; and there are still remaining indisputable evidences of their skill in those arts, in ancient croziers, bells, shrines, &c., and in illuminated manuscripts not inferior in splendour to any extant in Europe.

#### Easements by Prescription.

L. WEBB, Q.C.

Easements are acquired by prescription, or, in other words, by possession held during the time and in manner fixed by law, for after the lapse of the requisite period the law adds the right of property to that which before was possessory only. To constitute a legal possession there must be not only a corporeal detention, or that quasi-detention which, according to the nature of the right, is equivalent to it, but there must also be the intention to act as owner. An enjoyment in order to confer a title must have been uninterrupted, both as to the manner and during the time required by law; but in these easements which require the repeated acts of man for their enjoyment, as rights of way, it would appear to be sufficient if the user is of such a nature, and takes place at such intervals as to afford an indication to the owner of the servient tenement that a right is claimed against him—an indication that would not be afforded by a mere accidental or occasional exercise of it. By the 2 & 3 Wm. IV. c. 71 (1832), commonly known as the Prescription Act, the title by prescription is governed by statutory provisions, making length of possession prescribed by the statute a bar or title of itself, which was so before only by the intervention of a jury. The Act provides that, (1) claims of right of common and other rights with profit shall not be defeated after thirty years' uninterrupted enjoyment, unless held by consent or agreement; (2) claims of rights of way or other easements the prescription should be twenty years; (3) when the access and use of lights to and for any dwelling-house, workshop, or other building shall have been actually enjoyed therewith for the full period of twenty years without interruption, the right thereto shall be deemed absolute and indefeasible, any local usage or custom to the contrary notwithstanding, unless it shall appear that the same was enjoyed by some consent or agreement expressly made or given for that purpose by deed or writing; and (4) each of the before-mentioned periods should be deemed to be those next before some suit or action wherein a claim to which such periods relate shall be brought into question. A custom formerly prevailed in the City of London that a man might build to any height on his old foundations, although he obstructed his neighbour's ancient lights; and the like custom also existed, I believe, in the city of York and other places; but in the *Salter's Company v. Jay and Truscott v. the Merchant Taylors' Company*, it was decided that such customs were abolished by the Prescription Act. One object of the Act was to shorten the time by which persons who had the access and use of light could acquire an absolute right to it. The third section does not, it will be observed, say "when the access and use of light shall have been enjoyed as of right," because every person has a right to so much light as can come to his window. The Act brought this to a simple question. It says that, after twenty years' enjoyment without interruption, the right shall be deemed absolute and indefeasible. In order that the enjoyment which, in the quasi-possession of an easement, may confer a right to it by length of time, it must have been open, peaceable, and "as of right."

The Keith Institute, with all the contents of the library and museum, was destroyed by fire last Sunday morning.

## ILLUSTRATIONS.

ABBEYSTEAD, WYRESDALE, LANCASHIRE.

WE publish to-day two views of the residence recently erected by the Earl of SEFTON, K.G., in a charming position, which commands extensive views of Wyresdale, while the moors adjoining afford abundant opportunity for sport. The buildings are erected with the hard stone obtained on the estate, which furnished the material for both walling and dressings, and the roofs are covered with green slates. The flat roof of tower, which affords a capital point of outlook over the country, is of the Claridge Company's asphalt. A broad terrace runs along the south front of the house, terminated as shown in one of our views by the bridge which spans the little mountain stream running down under the eastern wing of the house to join the Wyre in the valley below. The general contractors were Messrs. J. & W. BEANLAND, of Bradford, the architects being Messrs. DOUGLAS & FORDHAM, of Chester. Our views are reproduced from photos by Messrs. BEDFORD LEMERE & Co.

## MISTAKES IN ARCHITECTURE.\*

BY PROFESSOR T. ROGER SMITH.

"WE are all of us wrong sometimes," so spoke, in the hearing of a friend of mine, one of our best-known humourists and men of letters. They were together on a steamer, and were watching the floundering of a sailing boat being navigated by a mariner who clearly had made a mistake in handling his craft. The famous man had a young daughter with him, and she asked, "What—pray what—is he doing, father?" and got the reply, "He is wrong, my dear; we are all of us wrong sometimes."

No truer word was ever spoken; and, if for no other reason than because it is so universal a fate to get wrong sometimes, mistakes would be justified as a subject for a lecture. But there is a much better reason for my selection of this subject. Forewarned is forearmed; and, though I cannot promise you an immunity from all mistakes, I can, I hope, point out some into which there might perhaps be some danger of your falling, and against which you will be likely to guard if your attention has been called to them.

A mistake is always an evil, and often a most serious evil. There are mistakes which a man may make inadvertently, and without blame, but which yet entail consequences more serious and lasting than those which follow many a crime. Shakespeare paints Wolsey as arrogant, unscrupulous, shrinking from nothing so that he might compass his ends; yet it is not any of the dark deeds with which he is credited that ruins him, but the blunder of laying a paper intended for his own eye alone before that of the king. It is only a mistake when a signalman gives the wrong signal, or a pointsman turns the points the wrong way, but it may lead to the slaughter of a score of innocent persons; or, to come nearer home, it is only a mistake to miscalculate a girder, or misjudge a foundation; yet it may lead to the ruin of a fine building and of its architect's career.

If, then, you succeed hereafter in steering clear of even a few mistakes in consequence of their having been pointed out here, that will be ample justification for our spending an hour together about this somewhat uninviting subject. I propose that we shall take up in the first place students' mistakes, and secondly those of architects; and though I will try to be orderly, I greatly fear that, as mistakes are subject to no rules that I know of, a discourse on them must of necessity be rather an irregular lecture. We shall, of course, have to leave unnoticed far more mistakes than can be considered, so those will be selected which are in the nature of things not unlikely to occur. Many of them will be such as have actually come under my notice; and, in clearing some of them up, I shall ask leave now and again to borrow a hint from the proverbial wisdom of our forefathers.

There is one peculiarity about mistakes, and what they originate from, which makes it not a little difficult usefully to

consider them in a mixed assembly. I allude to the difference in mistakes traceable to the wide differences in temperament, raining, quality of mind, and habits between different men. Put two men to the same test, and they act differently. If that test be some circumstance in architectural study or practice where there are several ways of going wrong, and but one of going right, each of them may make a mistake; yet it is all but certain that they will not both make the same mistake; they may each take a wrong road, but the roads will go in opposite directions. In acting as assessor in architectural competitions I have again and again seen this. One designer, for example, who is timid and perhaps inexperienced, with but cramped ideas, falls into the mistake of producing a formal, cold, spiritless design, correct perhaps and possibly economical, but showing so little invention, and with so little worth remark about it, that it has no chance. His neighbour lets loose a fancy and fertility of design of which he is the fortunate possessor, utterly regardless of considerations of expense or suitability, and produces a splendid plan for a building that could not be put up for three times the money, and that if erected would be quite inappropriate to the site and purpose, and of course his failure is as complete as that of his rival.

Each of these two competitors has made the mistake of failing to understand what was wanted, but the failure has been in opposite directions. No. 1 has fallen short, No. 2 has overshot the mark. I shall have occasion in the course of the lecture to mention other mistakes which, so to speak, hunt in couples from this reason, and we may rest assured that many a man who is safe not to make a mistake in some one definite direction may be in great danger of running to the opposite extreme.

*Students' Mistakes.*

To turn now to students' mistakes. The one which first seems to present itself is neglecting opportunities. This, when wilfully done, is vicious; but it is a mistake often made out of pure thoughtlessness. Many a youth fails to realise that when he left school or college and entered an office he embarked upon a quite new career, and that he has to acquire knowledge in a different way, and to enter upon a totally distinct education. At school or college the schoolmaster or the professor teaches; in an architect's office the principal gives opportunities. The schoolboy, or, to a certain extent, the collegian, gets into difficulties if he omits or neglects to learn. There are no equally immediate uncomfortable results if a pupil neglects his opportunities; but, nevertheless, the loss to him is serious—in some cases irremediable—though in most instances, as I have said, I believe this neglect to arise entirely from failing to comprehend the situation, and not at all from wilfulness or idleness.

Every chance of taking part in what an architect or his assistant have to do in actual practice is an opportunity—even copying a letter, making a tracing, or entering a message in a call-book, is a lesson if the pupil chooses to learn from it; much more valuable are the chances of seeing work and materials. The nature and use of these opportunities have been dwelt upon very thoroughly in some of the published addresses of recent Presidents of the Architectural Association, and, to some extent, by myself on a former occasion of this sort; so that I hardly need pursue the topic further, but may turn to mistake number two.

It is a great mistake to lose heart and give up. I believe there comes to most young men a time when the novelty of their change of occupation and position has worn off and the irksomeness of routine is being felt, with possibly the depression due to being in lonely lodgings, instead of at a bright home or the sixth form of a busy school, and the wish to give up rises. Fortunately, in most cases this is practically impossible, and the student feels obliged to stick to his work, gets over his difficulties, regains heart, and goes on. But time and tone are often lost in the struggle, and it is a thing to fight against. Rest assured that if your profession has been chosen with any degree of care, you are not likely to better yourselves by a change, and that to begin business life by losing a year or two, and starting afresh with the consciousness of a failure behind you, is, to say the least of it, unfortunate. Of course occasionally a student turns up of whom one must in honesty say that the greatest mistake of his life was adopting the architectural profession. If a man is thoroughly unfit for a calling on which he has entered, by temperament, training, and habits, and he and his friends become honestly and deliberately aware that this is so, of course the only wise thing to do is to stop. But for one person who has really made such a mistake, there are probably a score who, for a time, fancy they have done so; therefore it is far safer to urge you to resist giving up than to suggest it as a good thing to do. Remember that "A rolling stone gathers no moss," and "Faint heart never won fair lady."

It is not, however, only the pupil who is apt to lose heart. There is a good deal of discouraging and difficult business to be got through by many young men in the interval between their articles and their start in practice, and again in the early days of practice. In all these difficulties, whatever you do, do

\* Opening lecture at the commencement of the Session 1888-89 at University College, London.

not allow yourselves to be cast down. Constancy to a career is a matter to some extent, nay to a very great extent, under a man's own control, and the man who succeeds is the one who resolves stoutly that, be the rebuffs or disappointments or perplexities never so trying, he will not allow them to master him, and who carries out that resolve.

The young man, perhaps fresh up from the country, who goes round to the offices of one architect after another, and who answers every advertisement in the papers in the hope of getting employment, is on a very trying quest. But he is doing what most of us have had to do before him, and he is engaged in a way which has procured for many a man the opportunity of earning his daily bread, and for some has proved the first step in a career that has led to brilliant success. One of the most distinguished professional men of the day began his London career, when an unknown foreigner in our city, by answering the advertisement of a leading architect who wanted a young man to do nothing but trace in his office. This humble post he took, and filled sturdily till it was found how well he could do very much better work; and now his name is on every one's tongue. The proverb to take up when seeking for employment is, "Leave no stone unturned." This proverb is said to have been suggested by the habits of a sort of baboon who eats scorpions. Now, these creatures lurk under flat stones. So to make sure of his meal the animal, not having any clue to which stone may cover the hiding-place of the delicacy he desires, systematically turns over every stone as he goes. If this be not true it is apposite—*se non è vero, è ben trovato*—and gives a hint how to proceed when one is looking for employment in London.

To the more advanced man, who is feeling—as who among us does not sometimes feel?—that it is very hard to get on, I may perhaps offer the suggestion once made to me by a very successful man when I was complaining that I found it difficult to get on. "Do not forget that the difficulties are your security"—a consideration which has so much in it when one comes to turn it about in one's mind that I do not think any words of mine can add to its force.

One more proverb occurs to me, "Everything comes to the man who can wait." Everything that can come of itself seems to obey this law. Success is not quite included here, because—at any rate in professional life—success can only come to the man who is fit to succeed. But granted the fitness (and I trust you will all fit yourselves for success before your student career comes to a close)—granted the fitness, I repeat, even in so crowded a profession as ours and so enormously difficult a place as London, success may fairly be expected to reward each man who can go on bravely struggling for a sufficiently long time and who will not lose heart.

Once more, it is a mistake to lose heart if any particular attainment seems to elude you. Say you decide to draw the figure, the most valuable auxiliary to high-class architectural draughtsmanship, and you find it very difficult, or you decide to draw perspective, and you find it very perplexing. The thing to do is not to give up, but to go on; and if the difficulty takes twice the time and twice the trouble which it appears to have cost some comrade, believe me the acquisition is more than twice as advantageous to you, and indeed more than twice as necessary for you as for him, so that your double trouble and double time have been well bestowed.

It is a mistake, if you have the opportunity of choosing what work you will do—an opportunity which to some extent a pupil often enjoys, though an assistant seldom—to stick too close to one thing. As far as possible, try to get a share in each sort of work that is in the office, and if it is work that you are not used to, and find it difficult to perform, so much the more instructive is it likely to prove. It is also a mistake to shirk the work you do not fancy. A young friend of mine complained to me once that he was given a good many letters to write when he thought he ought to be drawing. I pointed out to him that when he was in practice he would have shoals of letters to write, and that the art of writing a good business letter does not come of itself—far from it; so that he ought not to object to have the opportunity given him of practising his hand upon what is as necessary a piece of attainment as draughtsmanship.

It is a mistake to take up too much that is outside your profession. Every young man ought to have some athletic pursuit—cricket, tennis, cycling, walking, riding, boating, swimming. But it is distracting to take up or keep up too many such pursuits, or give too much time to those you select. Similarly, some hobby or pursuit that is not exactly architectural, such as a certain amount of reading and a certain amount of society, are good, and in moderation desirable. But learning a profession is an arduous task, and the men who will succeed best are those who give up their evenings night after night to pursuits akin to architecture, such as a school of art, the Architectural Association classes and meetings, or working up privately book after book on construction, materials, &c., or practising design, or drawing, or working at the joiner's bench. You will find in many other professions the demands made

upon the time and attention of students for years leave them little leisure for any outside pursuit whatever, and I do not think architecture requires less thorough devotion of time and power than does medicine, or law, or commerce, or that there is less to learn in architecture than those other professions.

It is a mistake not to sketch. Going and looking at architectural buildings is certainly better than not seeing them, but not of much permanent service. Photographs, whether you buy them, or, what is worse (because it takes so much time up), make them, are almost worthless as substitutes for the results of your own sketching and measuring. What you draw you look at—you, to some extent, understand, and you generally remember, while the drawing will always remind you of what you saw and tried to fix on your paper. Some young men are disposed when they get a summer holiday to boat or bathe or ramble about, as if their daily occupations as architects were of no more interest to them than those of a linendraper, and ought to be forgotten instead of being fostered at holiday times. Holidays are the best opportunities of architectural study possible, and, let me add, as soon as the first difficulty of sketching architecture from buildings is got over, sketching tours are the most enjoyable holidays possible. More can be learned in a fortnight's well-directed sketching than in months of work over books and drawings, and I will engage to say that the architectural traveller gets twice as much enjoyment out of any trip which takes him to cities and towns of interest as any of the ordinary travellers he will fall in with on his route.

It is a mistake to sketch or to study alone, if it can be avoided. *Noscitur ex sociis*, which, being freely Englished, is "Birds of a feather flock together"; and though a man's books and drawings are not bad companions, human comrades and friends are more useful, if only they be of the right sort. The best comrade for a beginner is one who is more advanced than himself, and, fortunately, the tyro, if teachable, is far from being the worst companion for the advanced student. Habits, circumstances and opportunities of course differ, and under certain conditions a man must study alone; but much time is often lost, and mistakes are apt to be made by those who work alone, and especially if they work without guidance. The opportunities of getting good instruction, and of associating with other students, are fortunately on the increase, and are so well known that I need not recapitulate them here; but I will add that studying together in this classroom has been, as I have reason to know, a beginning of student friendships, some of which have lasted through life.

On the choice of subjects of study I have not much to point out, but I cannot forbear saying that it is a mistake to despise surveying. Many students consider that they ought to prepare themselves for purely architectural practice, and for that only, and that everything which can go by the name of surveying is unnecessary, if not beneath them. They believe surveying to be, at any rate, wide of their line, and that it is to be accordingly shunned; but when they come to practice, they will find that a certain amount of surveying work will come in their way, and must either be done or handed over to better-prepared persons. I am not now speaking of quantities, the preparation of which is, to a large extent, a distinct work, but of all that relates to the examination and care of existing buildings. If you reflect that in any city or town for one new building there are hundreds already in existence, and that each of these hundreds is likely to be repeatedly surveyed, now for repair, now for alteration or enlargement, now for sale or purchase or rating, and possibly again after injury by fire, you will see that the mass of surveying work in the aggregate is considerable. Much of this can be better done by an architect than by any other person, and from time to time every architect is asked to make surveys under circumstances which make it clear that if he cannot or will not, valuable connections will go elsewhere. Nor is this all. Architectural practice is always fluctuating, and not infrequently the question of surveying work or none is a question of bread-and-butter or none. So do not consider that surveys are nuisances or interruptions, but pick up what you can about them, and, if a chance offers, by all means try to see a little land surveying. A very few days in the field will make the methods of working clear to any one who has not forgotten his trigonometry.

There is a companion mistake, one, I mean, of an opposite character, which is sometimes made, and which may as well be noticed. It is the mistake of neglecting design. Designing is the highest part of an architect's work, and it is work that he must be able to do. I am quite aware that it is no use for a beginner to try to design. He has no materials yet, and it would probably be more likely to do him harm than good if he attempted to originate out of the emptiness of his knowledge something that should represent a building. But designing does not come of itself, and yet many students go on for years accumulating knowledge and experience, and make no attempt to exercise themselves in design. Whenever one has made a piece of architecture one's own by studying, sketching, and measuring it, it is a wise course to try to design a variation upon it, making use of the same features, details, and ornaments but

rearranging them. This may be done if you like upon a single feature and an extremely small subject, and from such beginnings there are many ways of going on. What I wish to urge here is that it is a mistake not to begin.

The last mistake with regard to study that I feel bound to name is the mistake of not going to the Continent. This is, perhaps, not so prevalent as it was in the height of the Gothic revival time, when many good students believed that if they could thoroughly master English Gothic they need not attempt more. Now that Renaissance of some sort is being more generally practised, more men go to Italy and Greece, but still the number is small in comparison with the number of pupils and students. This, I repeat, is a great mistake, and if you say that it is a serious expense and absorbs much time—which are the two things that can be said against a continental tour—the answer is, that as to time it cannot be better spent, and as to money, there are few liberal professions where some expense is not absolutely necessary at some time, while the scholarships and studentships obtainable give to a few students in each year substantial assistance. Certain it is that this period of continuous study in other countries and under other suns seems more than anything else to make the difference between the mere draughtsman and the accomplished architect.

#### *Examination Mistakes.*

Every professional student has now to look forward, more or less, to examinations. There are many callings in which these have been pushed too far; happily that is not the case, at any rate as yet, with architecture. We have, however, enough examinations and competitions for prizes to bring mistakes in examinations well within our scope this evening. The prime mistake is to go up unprepared, in the hope that one may succeed by a fluke; or, perhaps, in the mistaken belief that one knows the subject so well that no preparation is needed. I have had a rather long and rather wide experience as an examiner in architecture, and I can assure you that the degree of unpreparedness with which some candidates are content is perfectly astonishing. Perhaps a specimen of the worst papers I ever had to correct might be more amusing than impressive; but I am sure that many students of schools of art offer themselves for examination simply on the chance that by a fluke they may get through, and have signally and dismally failed accordingly.

In the case of the Institute examination for Associateship, or that for the district surveyorship certificate, long and careful preparation are needed, and for each of these a spice of practical training is wanted. The would-be Associate must have some practice in design, and must make himself personally familiar with some specimens of ancient architecture, and the would-be district surveyor must have some experience of the supervision of building works. Similarly where drawings have to be made with a view to prizes offered by the Institute, the Association, or the professional papers, a candidate, in order to have any chance, and to gain any good from entering on the competition, ought to have some experience of drawing, and, if the prize be for a design, some notion of designing before he ventures to compete; though, as these are competitions and not pass examinations, failure to succeed does not involve the same discredit, and ought not to have the same discouraging effect on the candidate as failure in a pass examination.

It is a mistake, let me very emphatically say, for any student attending the courses about to begin here to avoid the final examination or any intermediate examination. Of course the prizes are only few, and as far as they are concerned the examination at the end of the session is competitive; but the certificates are given to as many as get more than a certain proportion of marks without limit of number, and so there is for each one a chance of having his ability and diligence recognised, and the opportunity which the class examinations offer of proving to yourselves that you have learned and retained a fair amount of what I try to teach, is in my opinion of great value.

In the examination-room it is a great mistake to fire off a piece of knowledge that has nothing to do with the question, simply because you know it. As, for example, suppose you have carefully got up the tracery of windows of different periods of English art, and no question is asked about tracery, but a question is asked about mouldings. If in answering that question you drag in the tracery and spend half an hour over it, you do more harm than good. No examiner who knows his work will give a single mark for statements that are irrelevant and do not answer any part of the question, so you get no marks for your tracery; meantime the writing and sketches have wasted you half an hour, during which time had you been answering other questions to the best of your ability, you would have been earning marks.

Next to the mistake of lugging in irrelevant matter by the head and shoulders, comes the mistake of giving too much time to one or two questions. A paper in which there is no proportion among the answers is one very difficult to mark, but which, from the very nature of things, is sure not to get so many marks as one containing the same amount of writing and

sketches, but where more questions are taken, and a clear, condensed, yet correct answer given to each. It is a mistake, also, in architectural examinations not to illustrate the paper of answers by sketches whenever possible. If, unluckily, you cannot make tolerable sketches, it is very much to be regretted, and you had better stick to written replies; but if you have any reasonable mastery of the pencil, do not forget to introduce sketches, and the better they are the better your paper, and the higher will it be marked. It is a mistake—and one often made, I fear—to suppose that examiners in our professional examinations are anxious to trip you up, and that they lie at the catch and will be heartily glad if, by some clever and misleading device, they unfairly entrap you into a blunder. The object of the examiners is to bring out what you know and what you do not know, and it is with an anxious sense of serious responsibility that they carry on this important work. Rely upon it, they had rather be convinced that you are fit to pass than that you must be turned back. But rely, also, upon it that they will not pass you till they are so convinced.

It is a mistake to suppose that any answer which is not wrong will do. If a question involves a difficulty, the answer which evades that difficulty is very differently considered from that which attempts it, even if it should fail to solve it perfectly. For example, in a recent examination I gave the dimensions of a bay of flooring fit to carry a certain weight per foot, and required an iron girder to be calculated of a fixed span and strong enough to carry that bay. I got more than one reply in which the calculation was attempted, and was carried out on the right method; but the right result did not come out owing to errors or omissions in calculating. I got one reply, in which, after stating the number of tons to be carried, the answer went on saying, "I should adopt a rolled iron joist, so many lbs. to the foot." This answer was probably arrived at by some rule-of-thumb method; it was not far from being practically correct, but there was no attempt made to work out the calculation, which was the difficult part of the question, and of course I could not give such good marks to this reply, which avoided the difficulties, as to those in which the students had tackled them to the best of their ability and by proper methods.

*(To be continued.)*

#### YORK ARCHITECTURAL ASSOCIATION.

THE third excursion of this Association was made last week to Middlesbrough. On arriving at that town the members were met by Mr. Walter H. Hoskins, who led the way to the Municipal Buildings recently erected from the designs of Mr. G. G. Hoskins, of Darlington, selected in competition. Mr. W. Hoskins conducted the members round the buildings and pointed out the principal features of interest. The design is thirteenth-century Gothic. The Town Hall occupies the northern part of the site bordering on Corporation Road, and is separated from the Municipal Buildings by a glass and iron covered carriage-way. Over the principal entrance to the Town Hall stands a figure of St. George slaying the dragon, whilst surmounting all is a picturesque tower 170 feet high. The Municipal Buildings are arranged round a quadrangle, which is used as a drilling-ground for the police and fire brigade. The buildings provide ample accommodation for the Council, the police, fire brigade, free library, reading-room, water board and union offices. On the south side stands the council chamber, 55 feet by 35 feet, admirably fitted on the semi-circular plan for the accommodation of the Corporation. It is adorned with oil-paintings of four of the principal benefactors of the town.

#### MONTROSE MEMORIAL, EDINBURGH.

THE memorial proposed for erection in St. Giles's Cathedral, Edinburgh, to the memory of the Marquis of Montrose, who was executed during the civil war in 1650, has been completed. The design was prepared by Dr. Rowand Anderson, in the Renaissance style of the seventeenth century, and is suggestive of the form the monument would have probably taken had it been erected at the time Montrose was buried. The principal feature in the design is a semicircular arch deeply recessed, having in the recess a sarcophagus, with black marble bier carrying the recumbent figure in white marble of the marquis. The sarcophagus, mounted on a pedestal, is of a highly ornate character. The archway is flanked by two Corinthian pillars in black and gold marble, with caps and bases of alabaster. In the centre of each of the pillars is an alabaster wreath. These pillars are surrounded by a frieze, entablature, and cornice with ornamented pinnacles. The frieze is decorated with floral wreaths and panels. The latter contains one of the Montrose mottoes, "N'oubliez," while the rose of the Montrose and the clam-shell of the Grahams are also worked into the design. In the frieze immediately above

the pillars is a panel with the favourite device of the marquis—a lion leaping from one rock to another, separated from it by a chasm, with the motto "Nil medium." In the spandrels of the arch are circular panels containing shields—one having three roses, and the other three clam-shells. Rising over the cornice and between the pinnacles is a large ornamental panel, in which is quartered the full coat-of-arms of "The Graham," flanked by richly-carved pillars and dolphins, and surmounted by a pediment. In this pediment is another of the Montrose crests—a gloved hand grasping a porcupine, with the motto "Col senno e con la mano." The monument is finished off by another panel, which rises over the pediment, containing yet another crest—an eagle destroying a stork. The background of the arched recess is divided into three large panels, formed with alabaster mouldings, and in the centre panel, enriched with carved work, has been placed the inscription. The monument, which is well executed in coloured marbles and alabaster, with elaborate gilding, measures 9 feet across and 16 feet in height. Messrs. J. & W. B. Rhind were the sculptors. The recumbent figure of the marquis grasps a bronze sword.

### ROMAN SILCHESTER.

A VISIT was paid to Silchester last week by the Berkshire Architectural Society, under the auspices of Mr. Slingsby Stallwood, of Reading.

In the course of an address Dr. Stevens, the hon. curator of the Reading Museum, described Silchester as one of the fifty walled towns that existed in Britain during the Roman occupation. Those walled camps were remarkable, inasmuch as they had the control of the grand roads which the Romans made throughout the country, each camp marking the beginning or ending of a journey. The area of the Roman city of Silchester was about 120 acres, and the walls were a mile and a half in circumference; and the outline of the walls could be traced completely. The walls in their best days were 14 feet or 15 feet thick, and something like 20 feet high; but they varied, having been probably built at different times. There was a grand entrance at the south gate, which must have reared up at least 25 feet. The walls were made principally of flint, put together with extremely strong mortar, hardened with powdered flint and brick; and at intervals of about 2 feet 6 inches were courses of large "bonding tiles" of sandstone. The camp had four great entrances, placed by the points of the compass, as was generally the case with Roman cities. The east gate was approached by the Londinium (London) road, *via* Staines (Pontes), away over Bagshot Heath, where it was known as "The Devil's Causeway," and across the Loddon. The road from the north gate ran into Norfolk, passing through Streathley by the Ickneild way. The west road passed on, in the direction of Newbury, to the station called Spinæ (Speen), and on to Cirencester, another branch going away to Marlborough and thence on to Bath.

The ancient city without question had contained many fine buildings, but he had no doubt that it consisted to a very large extent of mud hovels of but one storey, covered with thick thatch. The supposed house of the Quæstor, the foundations of which were uncovered by Mr. Joyce, was described. It measured 98 feet by 127 feet, and had a gallery running round a courtyard, and on two of the sides of the gallery rooms opened out. This house had a double hypocaust, heated by one furnace, under the two main rooms, which measured 21 feet by 16 feet. One was supported by pillars, and the other rested on the radiating hypocaust, as shown in a diagram. One of the rooms was paved with hexagonal and octagonal tiles; and under one of the floors was found a "strong-box," which had no doubt been used for the storage of the treasure. Here also was found a bronze strigil—used for scraping the drops off the skin after bathing, thus answering the purpose of a rough towel. Instruments were also found for making mosaic pavements, proving that some of the finer tesserae were manufactured in the town, and not imported. The party then viewed the site of the vapour bath, and the hypocaust which still remains in block 2, and the passage adjoining, which retains its original tessellation. The forum, Dr. Stevens explained, originally contained an open market-place (where business was transacted), which was surrounded by a covered ambulatory. The foundations on the east and north sides were principally those of shops and offices, on the west being the public buildings, which were alternately square and apsidal. The extreme west range included an assembly-room, and in the centre the curia, which was a court in which a prætor probably presided. Next came the tabularium, in which the records were probably kept, and a seal had been found here. At the south corner stood the ærarium, or treasury, which was probably presided over by the Quæstor, and in the ruins Mr. Joyce found a bronze "eagle," buried under some charred remains in such a position as to indicate that it had fallen from the roof, where it might have been hidden by the soldiers who had it in charge, to prevent its falling

into the hands of the enemy. This "eagle"—a very unique specimen—appears to be of an Assyrian pattern; the wings had been torn off, and it had been wrenched from the standard. Next came the basilica, or hall of justice, which is also apsidal, for the use of the bench. The bema or tribunal is also well marked. It must have been a splendid building, Purbeck marble having been used in some parts. It was 60 feet in width, and evidently had originally an apse at the west end, which had been altered into a square. Between it and the market-place was a very handsome porticus, supported by fine Corinthian pillars, remnants of which still lie about. At the east of the basilica were other rooms, alternately apsidal and square, which were no doubt used as "Government offices." Then came the shops, oyster shells indicating where the fish-monger had lived, weights, scales, &c., the shop of the butcher, and a quantity of broken glass suggesting the existence of a caupona or wine shop. On the north side a place was pointed out which is supposed to have been the prison. The temple, on the south of the forum, was a polygon of sixteen sides, with an outer ambulatory, the whole having a diameter of 60 feet, and walls 3 feet thick. No altar or statuary had been found there.

At the amphitheatre, Dr. Stevens stated that the platform on which they stood was the arena, so-called from sand having been used after the manner in which sawdust is employed in circuses. It is enclosed on the right and left by mounds, gradually sloping upwards, and considered to have contained five tiers of seats, capable of holding several thousand persons. There were two vomitoria—places of entrance and exit, and the dimensions were 150 feet by 120 feet. In the size it differs somewhat from the amphitheatre at Cirencester, which is 148 feet by 134 feet, that at Dorchester measuring 219 feet by 138 feet. No masonry is visible in the Silchester amphitheatre.

### OWENS COLLEGE, MANCHESTER.

THE report of the Council was submitted at the half-yearly meeting held on Tuesday. It states that in July the Council received a letter announcing a further gift of 25,000*l.* from the residuary legatees of Sir Joseph Whitworth, Bart., to be applied to the Museum Building Fund. For this munificent gift, which goes far towards relieving the college from the heavy responsibility entailed by the erection of the museum buildings, the Council have tendered their most grateful acknowledgments to the donors. Visitors to the college will observe the beauty of the groining in the archway and staircase; its cost was greater than the estimate, and the architect has contributed 250*l.* towards meeting this. The Council have expressed their sense of the beauty of the work done, and of Mr. Waterhouse's generosity. The geological portion of the museum was formally opened to the public on June 8. Considerable progress has been made with the fittings of the upper storeys of the building, which are destined to hold the collections in zoology and botany. For some years the accommodation provided in the physical laboratory has been felt to be sorely in need of extension. This laboratory was from the first inadequate, and the increasing importance of the subject and the rapid growth of the number of students in the department have at last obliged the Council to deal with the necessity of the situation. Two large rooms in the basement, and contiguous to the existing laboratory, were set free by the removal into the new museum of the geological specimens and the large collection of minerals. Plans for the conversion of these rooms, which had been laid before the Council by the late Professor Balfour Stewart, have since been carefully matured, and a separate building for an electrical laboratory has been planned by Professor Schuster and Mr. Henry Wilde, F.R.S. These works are being rapidly proceeded with, and in a short time the Council believe that the college will possess a physical laboratory worthy of the name. The Council acknowledge the great assistance they have received from Mr. Wilde, who consented to join the committee charged with carrying out these extensions, and who has offered a liberal contribution towards their cost.

Early in the year the Council requested Mr. Waterhouse to prepare plans for utilising the large space at the north end of the main building, set free by the removal of the hoist, which, after the transfer of the natural history collections, was no longer necessary. These plans, which include (1) a convenient and much-needed access from the old to the new buildings, and (2) the provision of several excellent rooms, were in due course approved, and the consequent reconstruction has been to a great extent effected during the long vacation. The Council have also added greatly to the accommodation for the rapidly-growing library of the College (which now contains upwards of 45,000 volumes) by erecting a staircase between the present library and the large central room in the attic storey. The space thus annexed will probably give shelving room for 15,000 volumes.

A letter was read from the residuary legatees of Sir Joseph Whitworth stating that they had learned that a general hospital, in close connection with the college, was much needed, in which the students may receive practical instruction in medicine and surgery, and, as a commencement of such a hospital, the legatees will make over a sufficient site for the building, and contribute not less than 35,000*l.* towards the cost of the erection and furnishing the first portion, in addition to providing an annual income of 1,000*l.*

### THE GLASGOW INSTITUTE OF MEASURERS.

THE eighth annual meeting of this Institute was held on Monday, Mr. David Robertson, president, in the chair. It was reported that consideration had been given to the clause in estimates regarding the pricing of measurements at the rates and in proportion to the lump sum of offer, and the bearing of checking the cash extensions in estimates on that clause. Several legal decisions have been given affecting the matter, and a clause has now been prepared, with the advice of a legal gentleman, to meet the circumstances. This clause was submitted for the guidance of members. The three bodies interested in the preparing of rules for the measurement of wrightwork have not yet agreed upon a uniform mode, and have not sanctioned any rules. A joint committee is now engaged in drafting rules for the measurement of painterwork. At the examination on professional practice conducted by the Institute, seven young men in the offices of members have been successful, each of whom received a prize and certificate. The office-bearers for the ensuing year are:—President, John Dansken; vice-president, Robert Scott; secretary and treasurer, William Howatt, 146 Buchanan Street; auditors of professional accounts, David Robertson and Michael Cunningham; other members of Council, James Howatt, John Morrison, Daniel S. Wilkie, Robert Reid, John H. Ramsay, Alexander Knox, and James D. Herbertson.

### COMPETITION FOR COMMISSIONS.

A PAPER written by Mr. J. W. Yost, on the "Methods in Use for obtaining Professional Work," for discussion at the annual convention of the Association of Ohio Architects at Cleveland last August, appears in the last number to hand of the *Chicago Inland Architect*, as follows:—

In general, there are two classes of clients—those who come to us and those whom we seek. The former class of clients—here's to their health, long life, great prosperity and wonderful increase—this paper bids them God-speed and a good-day. The latter class includes a much larger portion of our clientage than it is pleasant to contemplate. In what way can it be diminished, and the expense of seeking work reduced? Let us examine some of our practices and see if we would not be as well off if we abandoned or changed a few of them. Where there is work of a desirable nature which does not come to us, we either call, write, or send for the purpose of obtaining it. The first object of the call or correspondence is to secure the work forthwith. If it can be thus obtained, at proper compensation, it comes sufficiently near the unsought work to need no further mention here. Our troubles would be few if all the work went to the first applicant. The anxiety to be first might be intense for a time, but it would be soon over.

It is probable that when we call, send, or write, we learn that some other architect has done the same thing, or is expected to. Perhaps several have already informed the parties of their desire to be architects of the proposed structure. It may be that it has already been a determination to have suggestions or designs from different applicants—possibly a competition.

It is probably a rule with few exceptions, if the architect believes his chance would be improved thereby, that he suggests a competition. Any one will get the work without a competition if he can, but when he finds that it cannot be thus secured, what is he to do? If he believes himself an architect superior in ability, so far as that particular building is concerned, and yet feels that he is at a disadvantage as far as influence goes, what is to prevent him suggesting a competition? At first sight it appears to be his duty to do so. Is he to deliberately allow a rival to outreach him without making his greatest effort and putting his "best foot" forward? He can, perhaps, by means of a competition, outreach his rival's influence or acquaintance, with a brilliant or novel design, or, by thus gaining time, he may find some way to bring to bear some influence to balance the acquaintance of his competitor.

But what is the result of competition under the supposed circumstances? Nobody gains anything and everybody loses by it. The inferior architect whose influence was feared, as a rule, wins the competition, and both are losers by reason of the competition to the extent of the cost of sketches. While I

know it is difficult to believe, it nevertheless is true, that personal influence decides nine out of every ten competitions where the competitors are known. I believe I have engaged in as many competitions, before as varied a cliental, and for as many different kinds of buildings, as any one of my age, and I am willing to say of such competitions, that nine out of every ten of not only those I have engaged in, but of all others I have observed, have been determined outside of the merits of the designs submitted. I say this, too, without casting any reflection upon either my competitors, myself or our clients. Those to whom we submit designs are not, as a rule, much posted in regard to architectural drawings, and it is a part of human nature to pay attention to and believe a friend rather than a stranger; and where there is not the slightest intention of being unfair this very quality enables men to take hold of what is presented with influence and acquaintance rather than that which stands alone upon the merit it contains. This same element of human nature is illustrated in the attachment of successive generations of the same family to the same church or political party.

Competitive designs do not usually differ so much in quality that the difference in merit of the various plans can be detected by an unprofessional eye, and made sufficiently clear to be unquestionable; and I am not sure that it would be greatly better if an expert were to render the decision, provided he is intimately acquainted with one competitor and the other is unknown. He who cannot secure work without competition will seldom find himself better off after a competition he institutes to gain it. We are likely to gain nothing through competitions of our own making.

A procedure which will be as well for all of us and for each of us, and often avoid unnecessary expense, one which has been frequently adopted by public authorities and often by individuals, is something like the following:—When different architects apply, or are desired to apply, or be furnished an opportunity to apply for a commission upon any proposed building, let a time be set when each or all applicants will be heard, giving each one an opportunity of presenting for examination whatever he may have to offer which he believes will tend to satisfy the proposed client that he is the proper person for employment. He need not present drawings at all unless he wishes to; or, if he does, he is not required to go to the expense of preparing drawings for that particular building unless he chooses. Let it be understood that whoever is employed is to prepare suitable drawings afterward. In short, let an architect be selected rather than a plan adopted.

I am confident that this will be found the better way. It will effect the end desired by both public officers in charge of building enterprises—that of being fair to everybody and giving all an equal opportunity—and will afford to all who desire to apply an equal opportunity without requiring any expense, except what each one for himself chooses to make. The adoption of this method will very greatly reduce the number of competitions, in fact, will surely benefit both client and architect.

It is seldom, indeed, that sketches presented in competition are carried into execution without first being changed to meet requirements unknown, and too numerous to be made known, to the architects in the competition, so that competitions do not succeed in securing a building plan. The only thing really accomplished is the giving of all an equal chance, which as aforesaid can be as well done without their delay and expense. This is, of course, not meant to cover those works of great importance where a comparison of ideas is highly desirable, and where no man's reputation or experience is sufficient guarantee of his satisfactory solution of the problem.

The great majority of competitions of an unnecessary character, while it may be perceptibly reduced by carrying out the suggestion I have made, will in some quantity be with us despite our protests. Not all people will at once give us what to them is an inexpensive amusement—that of looking over the suggestions—sketches of a number of different architects—all striving to solve most satisfactorily the same problem. While it is kept up by the public for its information or entertainment, it ought not to be at the expense of the profession.

If people will indulge themselves in the pleasure of having a number of suggestions for the same building, they ought to pay for the fun. The public ought, by the most practical means, to be taught that this sport is expensive to somebody. Architects cannot live on competition work done at the same rate as for work where no such expense is necessary, and the general business of the profession ought not to be loaded with the financial embarrassments induced by competitive work. We ought to make that class of work pay its own way. A fair compensation for competitive sketches will not fall below one per cent. of the cost of the proposed structure. The five per cent. rate for professional work ought, in all fairness to all parties concerned, to be increased to six per cent. for work gained in competition. Our schedule of charges ought to be amended to that effect. This will put the expense of the competition where it belongs. It will, when known to be the rule

of the profession, cause many to hesitate before indulging in such a luxury. I dare say it would nip in the bud three-fourths of all the competitions we would otherwise be unable to avoid. Competitions are proper in their place, and are useful for certain important purposes; but the burden of such even as are desirable should not be borne by the profession, and I am satisfied that the public will have little to do with most of them when it learns their real cost and is obliged to pay it.

### A LEANING STEEPLE AT COVENTRY.

IN the course of a letter to the *Times* on church restoration, Lord Grimthorpe, referring to the above subject, noticed in *The Architect* of last week, says:—

I have received a printed letter from a gentleman at Coventry, with the extraordinary information that the architect who has been "restoring" (which means rebuilding the outside of) the great steeple of St. Michael's has left the top leaning 4½ inches to the north-west, though, for reasons which he gives, it must have been well known to be so. This is nearly twice as much as the inclination of the top of Salisbury; and indeed far more, for Salisbury is much higher, and the base a great deal wider besides; for the narrowness of the Coventry tower was its conspicuous defect, and might easily have been cured now, as I wrote several years ago in one of the architectural papers.\*

Instead of curing it by enlarging the buttresses, if they did not rebuild it altogether, they—i.e., the architect and those who let him have his way—persisted in rebuilding it all exactly as it was; and now they want to get up another bad tower somewhere to carry the bells, which I could easily have made the other do if it had been built properly.

This craze for copying glaring mistakes and results of former poverty and ignorance is doing as much harm in one way as the destructiveness of Wyatt, the fashionable church-restorer of the end of last century, did in another. It has now spoilt Peterborough for another five centuries probably. Manchester is ashamed of the stupid rebuilding of its miserable cathedral tower exactly as it was before, and is crying out for another. Our architects—employed and interloping—and the antiquarian lunatics, of course, wanted to repeat all the worst work of the worst time of the Gothic architecture at St. Albans, except that Scott and his son did want the high roofs, which they have now got.

To be sure, some of them have hit on the better plan, perhaps, of writing grand phrases about "conservative restoration" in their reports to committees, and then committing any radicalism that they like—a practice not unknown to greater people than architects in these days.

### CHURCH BUILDING AND RESTORATION.

**Ashted.**—The church of St. James has been reopened after undergoing alteration and repair. The main walls have been underbuilt upon a secure foundation of concrete, while the decayed timbers of the roof, which is of great span, have been taken out and reinstated. The old ceiling has been taken down and renewed, and the old floors repaved with wooden blocks laid on concrete. The chancel has been paved with encaustic tiles and the steps rearranged, and an oak reredos has been made by Messrs. Jones & Willis from the design of the architects, Messrs. Osborn & Reading, of 13 Bennett's Hill, Birmingham. Messrs. Jeffery & Son were the contractors.

### SCHOOL BUILDINGS.

**Cleckheaton.**—The memorial-stones of a Wesleyan chapel and Sunday-schools have been laid. The chapel and schools are being built in Whitcliffe Lane. The chapel will seat 870 people, and the estimated cost of the undertaking is a little over 6,000*l.* The building has been designed by Mr. W. Henry Howorth, architect, Cleckheaton.

**Halifax.**—Plans have been prepared by Messrs. Horsfall & Williams for a Congregational church at Heath, Halifax. It is proposed to build the school first, to serve also as the church. The large room for church purposes will be on the first floor, and will accommodate 440. The school will be on the lower floor, and will accommodate 250. There will be four classrooms.

**The Successful Students** in the art competition for the "free studentship" prizes, instituted for Paisley by Mr. W. B. Barbour, M.P., for the promotion of art study, are Mr. J. Robertson, Mr. D. Bett, Mr. J. Wallace, Mr. H. Anderson, Mr. W. McLauchlan, Mr. J. Sandilands, Mr. H. Baird, Mr. M. Kelly, and Mr. J. Davidson.

\* *The Architect*, Jan. 22, 1886.

### GENERAL.

**A Picture, Welsh Scenery**, painted by Mr. Aborn, son of the surveyor of Eton College, and which was exhibited at the Royal Academy this year, has been submitted to the inspection of the Queen.

**The Works of Art** intended for the autumn exhibition of the 19th Century Art Society have to be sent in on Monday the 8th inst.

**A Sketching Club** is being formed at Ardrossan, and periodical meetings are to be held at which the work done by the members will be submitted.

**An Excellent Portrait** of the President of the Architectural Association, Mr. H. D. Appleton, F.R.I.B.A., appears in the October number of the A.A. Notes.

**The Monument** erected in Folkestone cemetery by the German nation, to the memory of the men belonging to the German navy who were drowned off Sandgate by the sinking of the *Grosser Kurfurst* on May 31, 1878, has been restored at the expense of Sir E. Watkin, M.P.

**The Stained-glass Window** presented to Manchester Cathedral by Mr. Christopher James Schofield, as a memorial of General Gordon, was unveiled on Saturday. The window was designed and executed by Messrs. Wilson & Whitehouse, of London.

**An Ornamental oak lych gate**, designed by Mr. Walter F. Lyon, and presented by Mr. R. Twining, of Bitteswell, has been erected at the parish churchyard.

**A Stained-glass Window** is to be placed in St. Peter's Church, Levenshulme, as a memorial of the late rector, the Rev. E. C. Hore.

**A Sum** of 5,000*l.* has been offered by a friend of Forbes to aid in providing a cottage hospital, on condition that the town provides a site of not less than three acres, and that a further sum of 2,000*l.* be contributed by the community.

**The Technical Scholarship** in engineering at the Mason College, Birmingham, annually offered by Messrs. Richard Tangye & George Tangye has been won by Mr. A. E. Jackson; also an extra technical scholarship of 30*l.* is awarded to Mr. J. J. Podesta.

**A Convalescent Home** is proposed to be built in Durham, for the friendly societies of Northumberland and Durham, and a committee has been formed to inaugurate the scheme.

**A Bazaar** was opened on Thursday last week, at Monk Fryston Hall, in aid of the restoration fund of the ancient church of Monk Fryston.

**Stratton Church**, which has been restored under the direction of Mr. J. St. Piers Aubyn, has just been reopened.

**A Church** is to be erected at Broadbottom-in-Mottram, at an outlay of 2,700*l.*

**The Folkestone Magistrates** on Saturday decided not to grant a theatrical license for the new pier until several means of exit are added, the doors made to open both ways, and other structural alterations made. Some weeks must elapse before these alterations can be carried out.

**The Pier** which is to be erected at Southend, at a cost of about 50,000*l.*, will replace the old wooden structure, considerably over a mile in length, which has done service for the last fifty years.

**The Dysart School Board** have instructed Mr. Hyslop, architect, to look out for a site for the erection of an infant school in the Sinclairtown district.

**Clochdy Llangyfelach** is another instance, as is pointed out by a correspondent, of a detached tower to a parish church.

**It is Proposed** to lay out St. John's Churchyard, Liverpool, as public grounds. The cost is estimated not to exceed 4,000*l.*

**The Trustees** of the Princess Alice Orphanage, New Oscott, have received from the foundresses of the Nechells Charities, Birmingham, a cheque for 3,000*l.*, which is to be devoted to the erection and partial endowment of a home for orphan girls at the orphanage.

**The Restoration** of Croyland Abbey was begun on Thursday last week by Mr. Thompson, contractor for the works at Peterborough Cathedral, under the direction of Mr. Pearson, R.A. The work will cost about 3,000*l.*, nearly the whole of which has to be forthcoming.

**St. Dunstan's College**, Catford Bridge, designed by Mr. E. W. Clifton, architect, was formally opened on Monday.

**A Sum** of 2,400*l.* has been collected for the erection of a memorial in the new cemetery at Evère, Brussels, over the remains of the officers and men who fell in the Waterloo campaign.

**Mr. G. W. D. Strange** informs us that he has opened an office at New Barnet, where he intends to practise as an auctioneer, surveyor, valuer, &c. He has resided nineteen years in the district, and has an intimate knowledge of property in the neighbourhood.

**CRIMINAL PROCEEDINGS**, under the new Merchandise Act, will be instituted against any person falsely representing any form of ventilator to be a Self-acting Air-pump Ventilator, said title being registered and our Trade-Mark, applicable only to ventilators manufactured by us. Any infringement renders the person infringing liable to two years' imprisonment. ROBERT BOYLE & SON, Ltd.

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## CONTRACTS OPEN.

ASHTON-UNDER-LYNE.—For Building Two Cottages. Messrs. J. Eaton & Sons, Architects, Ashton-under-Lyne.

BERKHAMSTED.—Oct. 17.—For Building Shops, &c., for the Co-operative Society. Mr. J. F. Goodey, Architect, 2 Victoria Chambers, Colchester.

BRADFORD.—Oct. 8.—For Building Warehouse. Messrs. Brayshaw & Co., Architects, Bowling Old Lane, Bradford.

BRADFORD.—Oct. 9.—For Building Shops and Business Premises, Kirkgate. Messrs. Empsall & Clarkson, Architects, 55 Tyrel Street, Bradford.

COVENTRY.—Oct. 7.—For Building Offices, Shedding, &c. Mr. Herbert W. Chattaway, Architect, Trinity Churchyard, Coventry.

CWMDANDDWR.—Oct. 15.—For Vicarage, Outbuildings and Approach Road. Mr. S. H. Cowper-Coles, Architect, Rhayader.

DUNWICH.—For Additions to Grey Friars. Mr. E. H. Bisshopp, Architect, 32 Museum Street, Ipswich.

ENDON.—For Semi-detached Houses. Messrs. Scrivener & Sons, Architects, Howard Place, Hanley.

GUILDFORD.—Oct. 10.—For Building Cookery Classrooms to Two of the Board Schools. Mr. W. G. Lower, Architect, 12A High Street, Guildford.

HORNSEY.—Oct. 8.—For Supply of Rolled Iron Joists. Mr. T. de Courcy Meade, Surveyor, Southwood Lane, Highgate, N.

HORSHAM.—Oct. 11.—For Additions, &c., to Town-hall. Mr. J. P. Gates, Architect, Dolphin Chambers, Shoreham.

IFRIDDIOEDD.—Oct. 5.—For External Cementing of Residence. Mr. R. Grierson, Architect, Bangor.

LEADENHALL MARKET.—Oct. 19.—For Underground Urinals, Water-closets, &c. Mr. Henry Blake, Sewers Office, Guildhall, E.C.

LIMERICK.—Oct. 25.—For Building Constabulary Barrack. Office of Public Works, Dublin.

MANCHESTER.—Oct. 5.—For Building Church and Schools, Moss Side. Messrs. Isitt & Verity, Architects, Sunbridge Road, Bradford.

PENMAENMAWR.—Oct. 6.—For Rebuilding Parish Church of Dwygyfylchi. Mr. E. M. B. Vaughan, Architect, Cardiff.

PRESTON.—Oct. 8.—For Building Medical Hall. Messrs. Myres, Veevers & Myers, Architects, 15 Chapel Street, Preston.

SEATON SLUICE.—Oct. 5.—For Building Two Coastguard Houses. The Director of Works Department, Admiralty, 21 Craven Street, Charing Cross.

STANNINGLEY.—Oct. 8.—For Building Board Schools, Outbuildings, and Boundary Walls. Mr. W. Lee, Clerk to the School Board, Leeds.

YORK.—Oct. 9.—For Building Mortuary at Fever Hospital. Mr. E. G. Mawbey, City Surveyor.

## TENDERS.

### ABERDEEN.

For Carrying Out Improvements at Ferryhill, for the Aberdeen Town Council.  
Pringle & Slessor . . . . . £382 0 0

### ASHDOWN PARK.

For Erection of Lodge, at High Beeches, Ashdown Park. Mr. S. W. HAUGHTON, M.S.A., Architect and Surveyor, East Grinstead and Tunbridge Wells.  
W. PLEDGE, East Grinstead (accepted) . . . £215 17 0

For Erection of Lodge at Wytych Cross, Ashdown Park. Mr. S. W. HAUGHTON, M.S.A., Architect and Surveyor, East Grinstead and Tunbridge Wells.  
W. PLEDGE, East Grinstead (accepted) . . . £283 0 0

### BELLAGIO.

For Erection of Entrance Lodge, near Read's Farm, with Entrance Gates and Fencing, for the Bellagio Estate Company. Mr. WALTER J. EBBETTS, F.R.I.B.A., Architect, Savoy House, 115 Strand.  
H. BAYLIS, Highbury (accepted).

For Erection of a Bungalow on Plot 62, St. Margaret's Avenue, for the Bellagio Estate Company. Mr. WALTER J. EBBETTS, F.R.I.B.A., Architect, Savoy House, 115 Strand.  
H. BAYLIS, Highbury (accepted).

### BOURNEMOUTH.

For Formation of Roads, Upper Parkstone Estate, West Bournemouth, for the National Liberal Land Company. Messrs. C. T. & W. H. MILES, Surveyors, Observer Chambers, Bournemouth.

## IMPROVED FLAT BRICK FIRE-PROOF FLOORS.

No. 1.—Longitudinal Section.

No. 2.—Longitudinal Section.

### NO THRUST ON WALLS.

The BEST as well as the CHEAPEST Fire-proof Floors yet introduced.

THEY are constructed with purpose-made hard-burnt bricks, with specially moulded dovetail projections, forming a mechanical key to hold the plaster protecting the iron, and provided with wedge joints throughout, forming the most compact and solid floor known. Experiments show a resistance to load and impact greater than furnished by the ordinary concrete floors. No thrust is transmitted to the walls, as in all arched construction, the walls being tied in and strengthened.

The floors are practically noiseless, the different densities of the concrete, brick and plaster, with the air space above, intercepting the sound vibrations.

The depth of the finished floor is 6 to 9 inches only, and when the saving on this head is taken into account, the cost does not exceed that of the ordinary combustible timber floor of corresponding strength.

## HOMAN & RODGERS,

Engineers and Patentees,

## TRADE NOTES.

MESSRS. J. WRIGHT & CO., sole manufacturers of Wright's improved fireproof fixing blocks for floors and walls, have just removed their head office to their works at Malden. All communications to the firm should now be addressed, "South-Western Works, New Malden, Surrey."

MESSRS. H. & C. DAVIS & CO., gas-stove makers, of Camberwell, have opened show-rooms at 59 Queen Victoria Street, E.C.

SANCTION has been obtained by the York City Council from the Local Government Board to borrow 2,100*l.* for hospital purposes, with approval of the revised plan and scheme for the erection of a mortuary adjoining the hospital, in lieu of the existing mortuary.

IT is proposed to purchase premises at Doncaster for a Liberal club, and on the space in the rear to erect a large hall for meetings, &c.

THE *Leicester Chronicle*, in a note on the business of the Town Council, says the Highway and Sewerage Committee had nothing of unusual importance to submit to the Council. So far as can be judged from the number of plans submitted to the committee the building trade of the town has been well maintained, and this is taken as indicating continued growth.

THE completion of the Aberdeen Fish Market, in course of construction at the Albert Basin, has been retarded by a serious subsidence in a row of piles on which part of the market was to have been built.

THE tender of Messrs. D. Macandrew & Co., of Aberdeen, contractors for the Peterhead convict prison, has been accepted for building two new official residences at the establishment. The houses, which are to form quarters for the medical officer and the chaplain, will cost 2,800*l.*

THE library and reading-room for the erection and maintenance of which at Girvan the late Mr. J. M'Kechie bequeathed 6,500*l.*, in addition to a free site, will, it is expected, be opened to the public in the course of another month.

A GOVERNMENT inquiry was held last week at Newport, Isle of Wight, the Town Council having asked sanction to borrow money for building a Corn Exchange.

TRIALS of the electric motor on the Birmingham tramways were made on Monday night and Tuesday morning, but owing

to the breaking of the driving-chains on each occasion, no practical results can be recorded. A downfall of snow contributed to the discomfiture of the experimentalists as they dispersed on Tuesday morning.

MESSRS. CAMPBELL, SMITH & CO. have been entrusted with the whole of the decorations of the new Lyric Theatre. The same firm carried out the work at the Empire some time since.

AT the meeting of the Midland Iron and Steel Wages Board, held at Birmingham on Monday, Sir Thomas Martineau presiding, the demand of the operatives for an increase of 12½ per cent. in the rate of wages was discussed. Attention was drawn to the increase of values shown in the Board of Trade returns of iron exported, to the fact of longer time being made in the local works, and to the reported quotations being much higher. In reply, it was pointed out that the market quotations did not represent the prices actually realised, and that there were large current contracts for iron at rates considerably below those which obtained when wages were fixed at their present figure. The President promised to fully consider the representations made, and endeavour to do justice on both sides.

THE chimney-shaft at the engine-house, East Farleigh, the pumping-station of the Maidstone Waterworks Company, has just been repaired. The cap and the upper part of the brick-work having become dangerous, a contract was made with Mr. Palmer, of Rotherhithe, a steeple-jack contractor, to do the repairs without a pole scaffold. Scaling ladders were used to reach the top, where a stage was erected. Messrs. Drake & Muirhead cast the cap, the weight of it being nearly 1½ ton. The height of the chimney-shaft is 126 feet above the river.

ON Friday evening the workmen employed by Messrs. Wallis & Sons, of Maidstone, and Messrs. Gray Bros., of Tunbridge, in the erection of the new bridge at Tunbridge, were given a dinner at the Castle Hotel by the two firms. Mr. G. E. Wallis presided, and Mr. O. Gray occupied the vice-chair, upwards of fifty being present, including Mr. F. Spencer, clerk of the works.

THE Local Board of Featherstone, near Leeds, have received notice of complaint from Lord St. Oswald as to the nuisance arising from their present sewage farm. Mr. M. Paterson, C.E., Bradford, reports as to the best means of remedying the nuisance that the 25 acres of land now leased

to the Board for sewage irrigation by gravitation are useless, being four or five feet of strong and intractable clay with no soil worthy of the name; that to lift the sewage 50 feet on to the nearest land suitable would cost 5,000*l.*; that precipitation works would be more costly than land filtration, with a less efficient result; and that land filtration works, embracing five acres of land, at a cost of 1,250*l.*, offer the best practicable means of extricating the Board from their dilemma.

MESSRS. J. WHITEHEAD & SONS, Aberdeen, have completed a granite pedestal for the statue of the late Mr. Samuel Morley, to be erected in Nottingham. The pedestal is formed of red Peterhead granite, with a base of grey Porsley granite.

A NEW town hall has been erected at Brecon, and special attention has been paid to the ventilation, the latest improved form of Messrs. Robert Boyle & Son's patent self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

TENDERS are to be obtained for the town hall new works, Northampton.

THE Glack Mansion House, 22 miles from Aberdeen, with 283 acres of land, has been acquired by the authorities of the Aberdeen Royal Infirmary and Lunatic Asylum, for the purposes of an adjunct or branch to the main institution in the town. The structural alterations necessary will be carried out by Messrs. Matthews & Mackenzie, architects, from whose designs Glack House was originally built.

THE salary of Mr. Colson, the manager of the Leicester Gasworks, has been raised from 750*l.* to 900*l.* per annum. It was stated at the meeting of the Town Council that Mr. Colson, in connection with the new works, which involved an expenditure of 150,000*l.* or 160,000*l.*, had saved 6,000*l.* or 7,000*l.* as architect and engineer.

THE Wheatsheaf Hotel, at Northwich, has collapsed, owing to the subsidence of the land from the salt-workings. Some time back subsidences had occurred in the hotel yard, and swallowed up such trifles as a horse and a dozen barrels of beer.

THE acceptance of tenders for building the proposed school for the Feltwell School Board has been postponed to an adjourned meeting.

PLANS have been prepared for the Northern Police Buildings, Glasgow, by the master of works, recommending the removal of all the existing buildings, and the substitution of an

entirely new structure containing thirty-five cells (the present cells number sixteen), with improved court-hall, and extended accommodation for the other adjuncts of the establishment. The probable cost will be 16,000*l.*

THE Darlaston Local Board on Monday decided to obtain tenders for furnishing the new public buildings. The preparation of new building by-laws was deferred till after the opening of the new buildings.

AT the meeting of the Dublin Corporation on Monday a communication was received from the secretary of the Dublin, Wicklow, and Wexford Railway Company, enclosing a copy of Major Marindin's award as to the viaduct to be erected across Beresford Place, with a copy of the revised design for the viaduct prepared in accordance with the award. The award stipulated that the total number of spans between the pier at the north side of Beresford Place and the pier at the north end of the Liffey Bridge adjoining the Custom House Quay shall not exceed five. The whole of the piers carrying these spans shall be of similar construction and design, and the wrought-iron lattice girders between the limits mentioned shall be of uniform depth and of design, ornamental but not too florid. If it be considered necessary for the protection of the public riding or driving through Beresford Place to fix any screen above the level of the girders, such screen shall be also ornamental and in harmony with the remainder of the design.

THE Clyde Navigation Trustees on Tuesday approved of a recommendation that a dock should be provided as speedily as possible at Cessnock to the extent of dock No. 1. The work will cost about 270,000*l.*, and will be three or four years in process of construction.

IT is officially announced that the term for inviting tenders for the contract for works for the improvement of the bar of Rio Grande do Sul has been extended to February 6, 1889.

THE tender of Mr. Humphrey has been accepted for the enlargement of the Union Workhouse at Epsom, from the plans of Mr. H. D. Appleton, F.R.I.B.A.

MESSRS. W. POTTS & SONS, of Guildford Street, Leeds have completed a clock and set of bells for the parish church tower at Paddock, Huddersfield. The clock shows the time on four large external dials 6 feet 6 inches in diameter, and strikes the St. Mary's of Cambridge chimes on the four smaller bells, and the hours on the large or tenor bell, constructed from the designs and plans of Lord Grimthorpe, with all his latest im-

# CURE.

provements inserted, on the solid cast-iron horizontal bed-frame plan, the top surface of which is planed perfectly flat; all the bearings of gun-metal screwed separately into the frame, so that each or any wheel may be taken out separately if required without disturbing the others; Lord Grimthorpe's double three-legged gravity escapement, and maintaining power on the bolt-and-shutter plan; compensation pendulum, composed of zinc and iron tubes with steel rod through the centre, and cast-iron cylindrical-shaped bob of about 2 cwt.; automatic gas apparatus for turning on and off the gas according to the season of the year. The hammers are fixed in iron frames with steel check springs, bevel wheels in iron stands brass bushed, gun-metal dial wheels cut on the engine, and copper hands balanced or counterpoised within. The dials are of skeleton cast-iron to form the circles, figures, and minutes, filled in with opal glass; also reflectors in metal frames, iron barrels, patent steel wire cords, and B-block pulleys bushed with brass and pivoted in, weights cast in slips for readier adjustment, index dial inside for the purpose of setting the hands outside, and everything necessary and requisite in a first-class clock, all made and fixed by Messrs. Potts & Sons, who got the work in public competition against some of the leading firms. The cost of the clock is defrayed by public subscription, and by all the various denominations. The fine set of five bells were presented to the church by Mr. Joseph Crosland, J.P., of Royd's Wood, Lindley, who also paid for the fixing. The tower being unsuitable for illuminated dials, Messrs. J. Kirk & Sons, architects, Huddersfield and Dewsbury, prepared the necessary plans, also put new floors in, the old ones being found decayed and not safe. Messrs. Potts have received instructions to make and fix for the county magistrates a new clock at Prestwich Asylum, Manchester; new clock at Dewsbury town hall for Alderman Mark Oldroyd, J.P. (the Mayor); and new clock at Burnley new town hall, for the Mayor and Corporation.

#### EMPLOYERS' LIABILITY.

A BRICKLAYER, William Brown, of Miles Platting, brought an action for the recovery of 100*l.* from John Burtenshaw, of Clayton, contractor, as compensation for injuries sustained in his employ at Dunkerley's Chemical Works, Bradford, on October 28, 1887. The case was that on the date mentioned he was working on the building of a wall when the scaffolding

on which he stood gave way. He sustained injuries from which he had not yet fully recovered. It was alleged that the defendant was himself present when the scaffolding was put up, and had his attention called to its defective condition. Mr. Titmas, architect, deposed that the scaffolding was not strong enough to bear the weights that, according to plaintiff's evidence, were put upon it. The defence was that the plaintiff contributed to his own misfortune. The Judge gave a verdict for the plaintiff—damages 21*l.* and costs.

#### REGISTRATION OF PLUMBERS.

At a meeting at Guildhall on Saturday, Mr. Wm. Henry Bishop, Royal Exchange Buildings, was sworn into the office of Master of the Plumbers' Company; Mr. C. Hudson, R.P.C., Greenwich, to that of Upper Warden; and Mr. W. Digby Seymour, Q.C., Temple, to that of Renter Warden, for the ensuing year. At the same meeting, the honorary freedom of the Company was conferred upon Messrs. W. H. Perry, W. H. Allen, J. Radcliffe, and W. Sevenoaks, four practical plumbers, who succeeded in passing in honours the City and Guilds of London Institute technological examination for plumbers, and who are now engaged as certificated teachers of plumbers' classes in the technical schools at Bristol, Cardiff, Manchester, and Windsor respectively.

At a public meeting held in the town hall, South Shields, the Mayor (Alderman Scott), presiding, Mr. Armour, of Gateshead, explained the position and objects of the Plumbers' Guild. Alderman Wardle, chairman of the Sanitary Committee of the South Shields Corporation, said everything would be done by himself and the members of the Corporation to render the guild successful. Dr. Munro, medical officer of health, pointed out that the benefits to the public arising from the registration of plumbers were quite as distinct and clear as they were to the plumbers themselves. In conclusion, he moved that Alderman Wardle, chairman of the South Shields Sanitary Committee, Councillor Robert Readhead, and Mr. J. H. Morton, architect, should represent the general public of South Shields on the District Council in Newcastle. The motion was carried. Messrs. J. L. Hall, John Dagleas, and J. Marshall were appointed to represent the masters, and Messrs. J. C. Burns, T. Cranston, and Thomas Lambell to represent the operatives on the Council.

A public meeting with a similar object was held in Council

### IMPORTANT COMMUNICATION. — WHITELEY'S FIRE.

WILLIAM WHITELEY, Westbourne Grove, London: October 12, 1887.

HOBBS, HART & Co., Limited.

GENTLEMEN,—It affords me very much pleasure to express to you my satisfaction and admiration at the splendid fire-resisting powers of your Strong-room Doors and the Safes.

The recent fire at my establishment, in my opinion, subjected them to the greatest possible test, and through all they proved invulnerable. The contents of both Strong Rooms and Safes were entirely preserved, although the fire was of such intense destructive force.

You will be pleased to hear that it has been decided to adopt your Patent Clutch Rebated Doors for all the party walls in the new buildings now in course of erection.—I am, Gentlemen, faithfully yours,

(Signed) WILLIAM WHITELEY.

Chambers, West Hartlepool, the Mayor presiding, supported by the Mayor of Hartlepool, Professor Gurnett, Durham Science College, Dr. Gourley, medical officer of health, Mr. J. W. Brown, borough surveyor, and Councillor Pyman. There was a large attendance of plumbers, including many apprentices. Councillor Gurry and Mr. Brown, borough surveyor, were appointed to represent the public interests. Four masters and four operative plumbers were elected as trade representatives.

A meeting was held last week at Middlesbrough, Mr. T. Sanderson, the mayor, presiding, for the purpose of instituting, in connection with the recent movement in favour of the registration of plumbers, a class for the technical instruction of members of the trade. Amongst those who were present were Mr. John F. Wilson, Mr. E. L. Kirby, Councillor Hind (Stockton), Mr. John Giers, and Mr. D. D. Wilson. Mr. J. Livingstone, Mr. George Lambert, Mr. Bullough, and Mr. D. Walton represented the Middlesbrough plumbers, and there were also representatives from Redcar and Saltburn, which will, together with Stockton and North Ormesby, be entitled to the benefits of the proposed instruction. It was stated that the trustees of the High School had offered to place at the disposal of the trade rooms in which to hold classes of instruction, which will probably be provided from the Technical College at Newcastle. It was stated that Stockton, in the event of a class being formed, would send at least sixteen pupils, and it was decided to leave the matter in the hands of the master plumbers, who will shortly communicate with Mr. E. L. Kirby, the secretary *pro tem*.

#### PROGRESS OF MANCHESTER.

ON occasion of a complimentary dinner given to Alderman Abel Heywood last week in Manchester, Mr. Heywood, in replying to an address, referred to improvements that had been made in the town. "You refer in your address to my committee work. Just in a sentence or two let me say that from first to last my efforts have been directed to making as far as I could the lives of the very poor worth living. I early saw the fearful insanitary conditions under which the poor of Manchester existed. Our committees have done much to make things better. True it is that a great deal has yet to be done, but in measuring what has been accomplished let the condition of things be remembered under which we came into existence, and bear in mind the almost unparalleled rate at which our population, and especially our working-class population, has

grown. With regard to the Improvement Committee, it certainly has done much good work. Manchester, if not an architectural wonder, is far different from what it once was. Deansgate is one great monument of our work. A broad spacious thoroughfare with palatial buildings, and no longer the congeries of courts and alleys in which the criminal population of the town found a secure refuge. Market Street, Piccadilly, Portland Street, Oxford Street, London Road, Albert Square, Hunt's Bank, and as many other of our principal thoroughfares all tell the tale of improvement. Victoria Street, too, as I need hardly remind you, is not the street it was. Passing on, I may recall the fact that in 1855 I became an alderman of Manchester, and that ten years later I was for the first time Mayor. We were then beginning to feel the inconveniences of the King Street Town Hall, and it was on my motion that a Town Hall sub-committee was appointed to consider the advisableness of building a new home for the Council and the corporate workers; of that committee I was chairman. We determined, and the Council approved our determination, to build a new Town Hall in Albert Square. On this matter I need dwell but briefly. Most of you are well acquainted with what was done. We cleared a vast area of its buildings, and Mr. Waterhouse's beautiful design rose stone on stone and pillar on pillar until this wonderful structure was at last completed. We spared no expense, yet we were not extravagant. Every detail we desired to have perfect. To have been parsimonious, to have neglected corners or recesses which were obscure, to have allowed ornamentation which was tawdry would have been for ever to brand Manchester as a city given up to no higher thought than the quickest accumulation of wealth. By universal admission the Town Hall is a worthy monument of the industrial greatness of Manchester, and an outward and visible sign to the world that our thoughts are not wholly given up to mammon, but that the higher culture is not neglected among us. Time may have darkened the outside purity of those walls, but the graceful, tapering towers and noble archways are still full of beauty as when the sound of the last hammer and chisel ceased; while the long cathedral aisles of the interior, this magnificent banqueting hall, the splendid central hall with the mural paintings on which Mr. Madox Brown has bestowed so much artistic care—these are the admiration of every stranger who visits our city. Day by day I saw this glorious building rise until every pinnacle was complete, and when at last came the opening day I found myself for the second time, by your favour and the favour of the citizens, Mayor of the city of Manchester. The Queen did

not favour us with her presence, as we hoped; but all who remember the magnificent ceremonies attending the occasion will probably be of opinion that, even with the presence of royalty, the demonstrations could not have been more complete and effective."

#### PRACTICAL EDUCATION.

ON Saturday Mr. H. S. Hele Shaw, C.E., of the Liverpool University College, distributed the prizes, and certificates to the students of the Liverpool Science and Art Classes in connection with South Kensington. In the course of his address he said:—The undoubted pleasure which the pursuit of knowledge insured, and the keen sense of the value of such knowledge for its own sake no doubt stimulated many, if not all, to persevere, but at the same time the majority required some substantial assurance of a practical return. From his own experience he knew how many inducements there were to relax attendance at evening classes, and sometimes give them up altogether, and bearing that in mind he readily accepted the invitation to say a few words to the students on that subject. In the history of successful men they were often struck by the apparently slender stock of knowledge which they possessed; many of the greatest engineers and inventors, not only of the past century, but even down to the present day, having been comparatively unlettered men. Careful study, however, would show that such men had succeeded in spite of, and not because of, this want of knowledge. It would be found that they all possessed force of character, which was not to be daunted by obstacles or scared by difficulties. They had been pioneers in some particular direction, and had struck out an original course for themselves. The history of successful men proved that not only must they have the power, but that it must be rightly directed, and still more did the history of unsuccessful men and inventors point to the same moral. It was true that many men of world-wide fame had but scant knowledge of book information on the principles of their life work, but it must be remembered that they were pioneers in new fields, and furthermore there was abundant evidence that these men learned what they could. The uneducated self-made man of to-day was rarely to be found who did not envy the advantages which the students of these science classes possessed, and the history of the past went emphatically to contradict the foolish notion which he was sorry to say sometimes found its way into the public press and scientific journals, that

because such men did not possess knowledge, therefore they despised it. They, however, had to do with to-day, and not with the past. It was hard to realise, without considerable effort, the lessons of the times in which we lived. Progress went on now as ever; the same originality was necessary, and the same qualities of mind as of old. Few succeeded where many failed, and out of 17,000 patents applied for each year only a small percentage survived the first stages. How many more would survive if inventors studied the charts and maps of their predecessors! It was certain that the inventor who despised the teachings of science, and went to work to rediscover for himself what he might learn from records left by others, had each year a smaller chance of success and a growing probability of spending his life in merely repeating the work of others who had gone before.

He then referred to Bartholdi's statue of *Liberty*; to the Severn Tunnel, and the way in which the difficulties of "setting" and flooding were overcome; and to the construction of the bridge over the Firth of Forth, which was exciting the wonder of all engineers. The train would be carried at a height of 150 feet above the level of the Forth, whilst the piers rose more than twice that height above the water. Nearly 50,000 tons of steel would be employed in the construction of the bridge, and would enable the two largest spans in the world to be formed. Those three examples showed that there was apparently no finality in mechanical science, and that the problems which presented themselves were equally new and required the same faculties for their solution as were required by the early engineers.

The same process of thought required to evolve great works was required day by day in every workshop and manufactory in the country, because if one man did not keep moving and produce new and improved designs he would soon be left behind by his rival. Perhaps one of the most significant features of the last Patent Act was the power which was given to the inventor to improve upon any patent, to compel the patentee to either take up the improvement or license the improver to use the original patent, so that the way of progress could not be blocked by the patent, however good and new, if something better and newer could be devised. He cited changes that were now taking place in actual workshop practice to prove that the methods and practice of the mechanical arts as yet were changing and progressing perhaps more swiftly than ever. All this progress was in one direction, which they might call the production of the copying principle in machines. It was

# FIRE! FIRE! FIRE!

## GRIFFITHS' "PYRODENE" FIREPROOFING LIQUID

(NON-POISONOUS).

Transparent Liquid for Rendering Woodwork Uninflammable,

Without altering its appearance, and where Painting is not desired, such as Wooden Fittings in Exhibitions, Churches, Pews, Matchboarding, Theatre Scenes, Wooden Stairs, Joists, Beams, Floors, Factories, Stables, Mills, &c., in fact, Structures of an inflammable nature of all descriptions. Acts as a priming for new Woodwork for Paint or Varnish. Also for rendering Theatrical and Ball Dresses, Curtains, Paper, Felt, Canvas, &c., perfectly uninflammable.

Griffiths' Liquid penetrates the pores of the wood. It lasts as long as the wood itself. It prevents Dry Rot and decay in house timbers. It does not crack, peel, or rub off.

It is perfectly innocuous and free from smell. It will keep any length of time. Any one can apply it. One gallon will cover double that of any other priming.

AND

All Woodwork in new houses should be fireproofed with this liquid, the cost is so trifling in comparison with the preservation of the timber and freedom from risk of fire. If work is desired to be painted afterwards, Griffiths' Pyrodene Paint is best for the purpose.

## GRIFFITHS' "PYRODENE" FIREPROOF PAINT.

READY FOR USE.

NON-POISONOUS.

ALL COLOURS.

This Paint is manufactured for preservative and decorative purposes equally as for its FIRE-RESISTING qualities. The Fireproof Paint and Fireproofing Liquid is used at some of the principal Theatres in the United Kingdom.

#### RECENT TESTIMONIALS.

From Messrs. MAXWELL & TUKE, Architects, 29 Princess Street, Manchester: December 28, 1887.

DEAR SIRS.—We used your Paints in nearly the whole of the works for the Royal Jubilee Exhibition, and with very satisfactory results.

Yours truly, MAXWELL & TUKE.

To Messrs. Griffiths Bros. & Co., Dashwood House, London, E.C.

From S. C. LOWE & SON, House Decorators, 32 Cavendish Street, Streteford Road, All Saints, Manchester: November 22, 1887.

DEAR SIRS.—In reply to your inquiry, we, as one of the contractors for the painting of the Manchester Jubilee Exhibition, which closed on the 10th of this month, have pleasure in stating that both your "Aqual" Paint, and also your "Pyrodene" Fireproof Paint, have given great satisfaction. We found them work easily with a covering power of from 30 to 40 per cent. over ordinary paint. Although applied during intense frost, and having been subjected to an almost tropical summer, followed by the drenching rains of this autumn, they are as fresh in colour and have as firm a grip as when applied, and appear quite unaffected by the nine months' exposure. We consider them, therefore, well adapted for all work in any climate.—Yours truly, S. C. LOWE & SON.

CHEAPER AND MORE DURABLE THAN ORDINARY PAINT.

GRIFFITHS' "PYRODENE" FIREPROOFING COMPANY, Limited,  
4 & 5 DASHWOOD HOUSE, NEW BROAD STREET, E.C., LONDON.

not a case now of one section in this country against another, skilled workmen against those who invented machines to do their work, but of this country struggling for trade against the world. They wished to train every faculty of the young, and leave no stone unturned to equip them for the keen competition of life. He had purposely avoided the use of the word technical, because people were getting tired and weary at hearing it trotted out with vague and unmeaning phrases and generalities. What they wanted was practical guidance as to how to meet the wants of to-day, and such instruction those classes of the science and art schools afforded. One of their objects that night was to encourage students to persevere, and he pointed out that it was only by patient repetition that skill was obtained in science and art, and it was the same thing in mathematics, and even classics. The same thing held all through life, and he firmly believed that why what were called premium apprentices or pupils were so often a drug in the market was on account of the very fact which was deemed by them to be of so great an advantage—passing in succession from one branch of work to another, instead of being kept steadily to one thing until they had thoroughly mastered it. There were, as it were, two dangers which threatened the barque of the young apprentices. On the one hand there was the Scylla of mere routine, and on the other hand there was the Charybdis of superficial knowledge and smattering attainments which meant still more certain ruin. There was, however, plenty of sea room between, and he felt sure that the students at any rate of the Liverpool science and art classes would be sufficiently good navigators to steer clear of either.

#### THE LAMBETH REREDOS.

LAST week we mentioned the dedication of the new reredos, presented to the parish church of St. Mary, Lambeth, by Sir Henry Doulton.

The reredos has been executed at the works of Messrs. Doulton, Lambeth, from the designs of Mr. J. Oldrid Scott. With the exception of four columns which are in salt glazed Doulton-ware, the whole of the reredos is in a fine terra-cotta of warm buff tint. It consists of a central portion 8 feet 6 inches wide, containing three arched bays; the centre opening is filled with a representation of the Crucifixion, and the arches on either side are subdivided, and each contains two sculptured figures. Slightly recessed from the central portion there are

wings 3 feet wide on either hand, making the total width of the reredos about 14 feet 6 inches. Up to a height of 5 feet the design is quite plain; the portion next above contains the sculptured panels set within arches, the traceried heads of which are richly elaborated. The central portion is terminated with a projecting cornice with ribbed cove below, and open cresting and pinnacles above; the highest pinnacles will support statuettes of angels. The height to the top of the cresting is 11 feet 9 inches, and to the top of the statuettes about 15 feet. The weight of the whole reredos is carried clear of the floor by means of a concealed girder.

The sculptures have been designed and modelled by Mr. George Tinworth. The central panel (4 feet 9 inches high, 2 feet 9 inches wide) contains a representation of the Crucifixion; the dying Saviour is shown hanging upon the cross, and regarding earnestly the little group of faithful ones standing near. Bending low at the foot of the cross is the weeping figure of Mary Magdalene, and behind her stands the Virgin Mary supported by St. John, both of whom are gazing at Jesus. On the opposite side of the cross are two soldiers tearing the garment of the Lord; behind them are two priests, and in the background other soldiers and a centurion on horseback. Above the Saviour's head is fastened the tablet bearing the inscription in Hebrew, Greek, and Latin.

In the four smaller panels (each about 2 feet 8 inches high and 11 inches wide) are single figures. Beginning at the left hand (the north side), they are as follows:—1. A figure of the Patriarch Moses bearing the table of the Law (Exodus ii.). In the background are represented a prickly pear and a broken Egyptian capital as a symbol of the broken power of Egypt. Etched in behind the figure is the reference, Numbers xi. 29. 2. A figure of the Apostle Peter carrying a lamb in his right hand (as an attribute of St. Peter; this is an original symbol of Mr. Tinworth's, see John xxi. 15), and a book and keys in his left. At his feet is a cock, and behind him are shown a boat and some nets. The reference here etched is 2 Peter i. 3. A figure of the Apostle Paul in prison, with fetters upon his wrists, and a scroll in his hand. Etched on the background are the words, "I have fought a good fight, I have kept the faith," and the reference, 2 Cor. xi. 22. 4. A figure of the Prophet Elijah, staff in hand, and attended by two ravens. In an opening in the tracery above the figures of Moses and Peter is represented a nest with birds feeding their young, and in the corresponding position on the other side, a similar group of birds about to fly from the nest.

OETZMANN & CO., HOUSE FURNISHERS, HAMPSTEAD ROAD, N.W.

Inserted in quatrefoil panels in the wings of the reredos are four portrait medallions of archbishops. Beginning on the left hand, they are arranged as follows:—Hubert Walter or Fitzwalter, archbishop from 1193 to 1207, Lord High Chancellor in the reign of Richard I. 2. Richard Bancroft, archbishop from 1604 to 1610. 3. Thomas Tenison, 1695 to 1716, translated from Lincoln. 4. Thomas Secker, archbishop from 1758 to 1768, buried in the churchyard of Lambeth.

The medallions of Bancroft, Tenison, and Secker have been modelled from photographs taken from the original portraits in Lambeth Palace; that of Tenison was painted by Simon Dubois, and that of Secker by Sir Joshua Reynolds.

#### REFUSE DESTRUCTORS.

AT the quarterly meeting of the Yorkshire Association of Sanitary Inspectors, held in Bradford on Saturday, Mr. Wm. Warner, C.E., of Nottingham, read a lecture on "Destructors and Refuse Furnaces." He remarked that the development of the burning method of destroying town refuse had been no easy matter, and at the present time it had to fight many battles; but a study of the points raised would show that all the objections to the system were without foundation. Yorkshire was one of the first places to enter the field. Leeds had its first destructor built in the year 1877, and it appeared to have sufficiently satisfied the Corporation that a second was built in 1879. In 1881 the system was taken up with spirit, for Blackburn, Bolton, Bury, and Bradford erected furnaces of this kind, and in the following year Derby, Ealing, Hull, Nottingham, and Salford came to the front. It must not be assumed that those towns which had destructors at work had not been troubled after once their collected refuse became treated by fire, for agitation had been repeatedly set on foot to close such works. The evidence of the highest medical authorities, however, was that it could not be possible to obtain a verdict against the use of furnaces for burning refuse if constructed upon the best principles. They had the evidence of medical men that, where destructors had been started, the death-rate had been reduced. This might not be caused by the furnaces themselves, although it must be attributed to them, as there was not the slightest doubt that where they were erected the authorities, through the able diligence of the sanitary inspectors, looked up every hole and corner in the districts where they were situated, and by that cause a better bill of

health was the result. There was another important feature as assistant to health in the fiery process. The destructor, as erected at Hammerton Street, Bradford, as shown by Mr. Codrington, required some 13 tons of air, taken from the atmosphere, to each ton of refuse consumed. Calculating upon the 72 tons, which was about the quantity burnt in twenty-four hours, there was something near 1,000 tons of air taken up during that time, and as 13 cubic feet of air at 60° Fahr., and under a pressure of 30 inches of mercury, weighed about 1 lb., nearly 30,000,000 cubic feet of air was required for the effective burning in the destructor every twenty-four hours. This enormous quantity of air burnt must be replaced at one continuous rate, and they might therefore imagine the chimney to be a huge ventilator, which not only drew the impure air into the furnaces, where its injurious properties were destroyed, but actually caused a current of fresh pure air into the neighbourhood equal to the great amount already mentioned. Consequently those who lived near destructor depôts had the advantage of the immense volume of air necessary to replace that which was taken into the furnaces, and thus purified the atmosphere, were better looked after by the authorities, and kept more free from ordinary nuisances. Taking the ordinary refuse at Leeds and Bradford, and an average of the residue after destruction, there was only 28 per cent. of combustible matter to do all the work; in other words, this small percentage of combustible had to raise the temperature of the furnace sufficiently high to fuse a bulk of mineral matter 20 per cent. greater than itself, and evaporate 47 per cent. of water, which was more than 70 per cent. over that amount, and all this must be done in the presence of each other. After describing the several appliances introduced for burning refuse, he passed under notice Jones's "Fume Cremator." Dr. Tidy had said, "I cannot help thinking myself that in Jones's destructor, where he places a muffle furnace or 'fume destroyer,' as he calls it, between the furnace and the main shaft, he has in a great measure met those two difficulties by a certain escape of offensive vapour, mainly due to partial burning and the escape of fine sand from the shaft at certain stages of the operation." From experiments conducted with the heat passed from refuse furnaces, the best boiler to generate steam was found to be of the multitubular type. By such construction a great heating surface was obtained, and a more effective use of the gases was secured. The pyrometer as adopted at Leeds would be found of valuable assistance to detect and maintain the heat and steam at a regular pressure, and thus cause the workmen to

recognise these important features. As to the utilisation of the products of the destructor, he spoke confidently of the possibility of its being so carried out as not only to pay for the cost of burning and the repayment of capital expended on plant, but to produce a revenue to aid the necessary cost of collection.

Mr. Cox, borough surveyor of Bradford, said that he had found that the adoption of rocking-bars secured a more complete combustion. As a result of careful trials, it had been found the destructor yielded clinker and ashes to the extent of one-fourth in bulk, and one-third in weight, of the refuse before treatment. The making of mortar reduced the cost of working the destructors, and at Bradford in one year as much as 1,200*l.* had been received.

### THE NINE ELMS CARRIAGE WORKS.

THE Society of Engineers recently paid a visit to the London and South-Western Railway Locomotive, Carriage and Waggon Works, at Nine Elms, and were conducted over the works.

These works, which were originally designed by the late Mr. Joseph Beattie, and at that time considered very complete, have been, owing to the increase of traffic and stock, considerably altered and enlarged by Mr. William Adams, the present superintendent. The works, which cover 45 acres of ground, are situated at Nine Elms, which is on the south-east side of the main line after leaving Vauxhall station, and between 2,000 and 2,500 men are employed.

The locomotive department consists of machine, erecting, wheel, smiths', fitters', cylinder, brass, copper-smiths', boiler, tender-fitters', mounting and pattern shops, grindery, iron and brass foundries, and running sheds. The "short" machine shop is a large brick building, well lighted, and is 164 feet long by 57 feet wide. It is well fitted with the most modern classes of machine tools, milling machines being conspicuous by their large numbers, notably an horizontal milling machine by Messrs. Muir, of Manchester. A very massive profile milling machine is also used for machining such articles as "expansion-links," "jaw and T-ends of eccentric rods and connecting rods." These machines leave the work in such a state of perfection that further attempt at finishing with a file would only spoil it. There is also a very massive-frame plate slotting and drilling machine combined, capable of slotting 12 steel plates, 1 inch thick, at one

time. The drilling is done by three of Messrs. Craven Bros.' radial drilling machines, having a radius of 10 feet 6 inches, which overhang the table of the slotting machine. This arrangement considerably diminishes the amount of time and labour, as plates can be slotted and drilled at one setting. We also find here numerous slotting, planing, and boring machines, also a duplex coupling-rod planing machine having two cross-slides, and arranged to cut when the machine is running in either direction. Also a circular saw for cutting cold iron, which is found to save much time and labour in cutting out such work as the jaw-ends of rods, &c. The steel line shafting for driving the innumerable machines is supported on cast-iron columns, and runs the entire length of the shop. Leaving the "short" machine shop, we enter the cylinder shop, which is provided with a very useful overhead travelling crane, made at Nine Elms. Here will be noticed two very fine vertical milling and drilling machines, which are used for machining the valve faces of cylinders; also a radial drilling and tapping machine, in connection with which is used "Pearn's" patent tapping apparatus, by the use of which cylinders can be drilled, tapped, and studded with one setting. The cylinder boring machine is adapted for boring two cylinders at one time. The cylinders for the new tank engines, which are being built at Nine Elms for suburban traffic, being cast together, both bores and valve-spindle stuffing boxes are machined at one time. This shop is 57 feet long by 29 feet wide. Entering the fitting shop, which is 118 feet long by 58 feet wide, and arranged upon the most approved plan, we notice several "vortex blast pipes," the invention of Mr. W. Adams. There is no doubt that when this pipe is designed on thoroughly scientific principles that a great saving of fuel is effected, and this has been proved by the gradual decrease of coal consumption during the last three years on the South-Western Railway. We may here mention that the average consumption of fuel in 1885 was 30 lbs. per engine mile, which has now been reduced to 26½ lbs. per mile. This has effected a total saving, since June 1885, of nearly 34,000*l.* There are now nearly 300 engines on the South-Western Railway alone fitted with this pipe, and it is giving very great satisfaction. Coupling-rod bushes are now made solid without adjustment, and are forced into the rods by means of a small hydraulic press recently made at Nine Elms. Passing into the brass shop, which is 59 feet long by 45 feet wide, we find it provided with the most modern appliances for brass finishing, amongst which may be mentioned four "Cooper's patent lathes," which are too well

Preston's Patent Screw  
Adjustment,  
For opening, closing, & fastening Windows.

A 553.

## JAMES CARTLAND & SON, Cabinet, Builders' & Furnishing Brassfounders, BIRMINGHAM.

The Extent, Variety, and Finish of Articles Manufactured at this Establishment cannot be excelled.

THE REGISTERED DESIGNS AND PATENTED ARTICLES ARE NUMEROUS AND VALUABLE.

All Goods for Export are CAREFULLY PACKED IN CARTON BOXES, and distinctly labelled with Orange-coloured Labels, bearing the Trade Mark as at side.

The attention of Architects and Builders is specially drawn to the merits of PRESTON'S PATENT SCREW ADJUSTMENT for Opening, Closing, and Fastening Windows of Churches, Board Schools, Warehouses, and Manufactories, as its extreme simplicity cannot fail to commend it.

An endless Cord passing over a grooved Pulley, and worked by hand, causes the Box to travel on Screw, carrying the Sash with it to the required distance, and remaining securely locked at any angle. The action is perfectly easy and a child can adjust it.

DRAWINGS MAY BE HAD ON APPLICATION.

Glossy, durable, quick drying, one coat equal to two of ordinary paint. Suitable for all climates.

### SILICATE PAINTS, Varnishes, Ready Mixed Paints,

In self-opening tins, &c., &c.

APPLY FOR SAMPLE CARDS AND DESCRIPTIVE CIRCULARS.

known to need further description. In this shop is made the white metal piston and valve rod packing, which is a standard now with all new engines of the South-Western Railway, and is giving the greatest satisfaction. There is a pressure-gauge testing machine, and also one of Edward's patent emery-band grinding machines, which has proved a most valuable machine for finishing all kinds of brass fittings of irregular shape. We then enter the millwrights' shop, which is 85 feet long by 58 feet wide, and which is fitted with very modern machinery, including two universal milling machines, cutter grinding, slotting, planing, and shaping machines. In this shop are made the twist drills, taps, reamers, and small machines which are used throughout the shops at Nine Elms. In the course of construction is a double-cylinder horizontal steam-engine for the saw-mill. It is intended to run at 140 revolutions per minute, and will drive on to the line-shaft by means of ten ropes, and will be capable of transmitting 350 indicated horse-power. We pass through the coppersmiths' shop, which is fitted with the usual brazing furnaces, &c., which do not call for any special comment, and proceed to the "long" machine shop, which is 300 feet long by 57 feet wide—the standard width of the shops at Nine Elms. The steel line shafting here is carried on cast-iron columns, and runs the entire length of the shop. The vertical engine for driving this is coupled direct in the centre of the shop, and runs at 100 revolutions per minute. All machines of one class are placed together. Screwing machines are the first to attract our attention, the most modern of which are Barrow's patent, capable of screwing, with excellent finish, some 800 copper stays in the course of a day. Further on are larger machines of the same class capable of dealing with square-threaded screws of carriage couplings, &c. In the same shop are numerous small lathes, shaping machines of all sizes, a very heavy brake lathe, and a very massive crank axle lathe by Messrs. Craven Bros., of Manchester, having four rests, all of which may be used at one time. A piston-rod grinding machine is here in use. The rods are first roughed down in the lathe and finished off here. Mr. Adams was the first to use this form of labour-saving tool, and we had an opportunity of judging the work turned out by this machine, and it left nothing to be desired. Nearly all the drilling machines at Nine Elms are fitted with balanced spindles, and this is found to save the breaking of many drills. Entering the wheel shop, which is 195 feet long by 57 feet wide, we find five 7-feet, two 6-feet, and one 4-feet lathes. These are served by two 4-tons "walking" cranes, to which motion is

communicated by an endless cotton rope. We notice in this shop, being turned, a large rope fly-wheel for the stationary engine for the saw-mill. This wheel in the casting weighs 8 tons. In this shop are also the usual quartering, axle-grooving, and wheel-studding machines. There is also a tyre furnace and shrinking well, which are served by a separate fixed crane driven by an endless rope.

The erecting shops consist of two bays, each 500 feet long by 57 feet wide and have accommodation for seventy engines. There are three roads in each bay. Each erecting shop is provided with two 25 tons overhead travelling cranes which are capable of lifting an engine bodily from one road to another. The cranes are driven by an endless cotton rope, and each is capable of lifting and travelling transversely and longitudinally at one time, all of which operations are controlled by one man. There is in all 2,000 feet of line shafting, which runs in cast-iron self-acting pedestals, and is provided with Mather & Platt's friction clutch, so as to enable any one length to be disconnected at will. This shafting is found to be of great use in working the "Stowe" flexible drills, cylinder boring and valve facing machines, &c. Hydraulic piping, supplied with water at a pressure of 1,500 lbs. per square inch, is laid throughout the entire length of these two shops, so that small hydraulic tools can be worked from this source of power. In these shops will be noticed several of Mr. Adams's bogies, steel being freely used in their construction. The far end of one of these shops is used as a paint shop, and from thence we pass across the steam traverser, which has recently been lengthened, and is capable of carrying an engine 30 feet wheel base, into the tender shop, which is 90 feet long by 51 feet wide, and which is fitted with a Tweddell's small hydraulic rivetter, and a 25 tons overhead travelling crane driven by an endless rope. We now enter the boiler shop, which is 178 feet long by 116 feet wide, and which is fitted up with the most approved appliances as used in the manufacture of locomotive boilers. This shop is divided into two bays, the first of which contains the machine tools, and is fitted with a 15 tons overhead travelling crane by Messrs. Craven Bros. of Manchester. Here are also numerous radial and multiple drilling machines, and a fine 12 feet plate edge planing machine and two tube plate drilling machines. There has also been recently fixed a pair of horizontal plate-bending rolls by Craig & Donald, which are capable of bending steel plates 8 feet wide by  $\frac{3}{4}$  inch thick. All the rolls are of solid steel, and the top roll is capable of adjustment by power from

WORKS, ROTHERHAM. Estab. 1854.

the main driving pulleys. There is also in this part of the shop a plate-grinding machine which has been recently made at Nine Elms, and is found to be thoroughly efficient. A very large number of boilers are in progress of manufacture. Steel, with the exception of the fire-box and tubes, is wholly used in their manufacture. Manganese steel stays are now replacing copper for the firebox. In the adjoining bay is fixed one of Tweddell's stationary hydraulic rivetters, having 11 feet 6 inches gap. In connection with this is a 7 tons hydraulic crane. Along the adjoining wall are fixed six smiths' fires. Close by are two large heating furnaces, and one of Tweddell's flanging-presses, which are served by one crane. At the mouth of one of the furnaces is a very massive levelling-table, upon which the steel frames for engines are levelled after being punched roughly to shape. In the same part of the shop is fixed a large punching and shearing-machine by F. Berry & Co., which is capable of punching  $1\frac{1}{2}$ -inch holes in  $1\frac{1}{2}$ -inch plates, 3 feet from the edge. Leaving here we pass into the boiler-mounting shop, which is fitted with several tapping and staying-machines made at Nine Elms. Continuing our journey we arrive at the hydraulic engine-house, in which is fixed two pairs of engines by the Hydraulic Engineering Company of Chester. These supply water at a pressure of 1,500 lbs. per square inch to an adjoining accumulator, from which all the hydraulic tools in these shops, including three turntables, are worked. In a part of the same building is a battery of stationary boilers of the locomotive type. These supply steam to the whole of the stationary engines at Nine Elms Works. It was found on examination that the water used for these boilers deposited a scale on the plates, and Maignen's process of softening and filtering water has been adopted with very satisfactory results. We then make our way into the smiths' shop, which is 194 feet long by 57 feet wide, and contains twenty-six forges, inclusive of bolt-makers' fires. There are in this shop five steam-hammers, also olivers, three circular saws for cutting hot iron, Ryder's forging machine, Horsfall's patent bolt-making machine, and various other tools and appliances. Blast is supplied to the forges by a Baker's blower. Recrossing the traverser road, we enter the forge and spring-maker's shop, which is a large brick building, 176 feet long by 51 feet wide. Along either side of the building are arranged the forge furnaces, over which are placed locomotive boilers, and fed by the waste gases from the furnaces. These boilers supply steam for working the hammers, &c. Between the furnaces are arranged the steam-hammers,

which consist of two of Rigby's 35 cwt., one 7 cwt., and one 20 cwt. These hammers are served by hand-power cranes, which were made at Nine Elms. In the spring-makers' shop are the usual spring-plate furnaces; also two spring-making machines, one with three motions for spear-pointing, nibbing, and slotting. Close by is a steam spring-testing machine, which was made at Nine Elms. Leaving this shop, we come to the three cupolas with drop bottoms, the largest of which is capable of melting 8 tons of iron per hour. In connection with these there is a steam-hoist for taking the materials up to the charging level. We now enter the iron foundry, which is served by two 5-ton steam cranes, by Appleby Bros. There are also two core-drying stoves, and the usual sand-sifting and mixing appliances; and we may here mention that machine-moulding is largely used at Nine Elms. Adjoining this is the brass foundry, which is fitted with Fletcher's furnaces and the usual appliances. We again cross the traverser road, and enter the carriage-building shop, which is a well-lighted building 194 feet long by 60 feet wide, in which the bodies and under-frames of coaches are built. This shop is heated by exhaust steam. We now pass into the first bay of the saw-mill, in which is fixed a very fine log-frame saw, also a 4-feet band-saw. The far end of this building is utilised as a pattern-makers' shop, in which is fixed a dimension sawing-machine, a band-saw, and a hand-feed planing-machine. Entering the second bay of the saw-mill, which is 194 feet long by 78 feet wide, we find a panel-planing machine by Messrs. Ransome & Co., and a power-feed sand-papery machine by Messrs. Fay & Co., which is used for the mahogany panels of carriages. The cylinder over which the sand-paper is placed has a flexible covering. Adjoining this is a four-sided planing and moulding machine, also a panel-scraping machine, the action of which resembles that of an ordinary hand plane. At the end of the shop is a double-band sawing machine by George Richards & Co., of Manchester, which is especially constructed for cutting out the wood segments of Mansell's wheels. Continuing our journey further, we come to a portion of the shop which is allotted to the sharpening and setting of saws, &c. Here is to be found one of Messrs. Richards' knife-grinding machines, an automatic band saw-sharpening and setting machine, and two circular saw gumming machines. Leaving here, we notice a hand-feed planing and boring machine. Adjoining this is a cross-graining and tenoning machine by Messrs. George Richards & Co., which is used for cutting out the tenons in waggon under-frames, &c. The next to attract

## THE IONIC.

Rd. No. 81623.

### EDWARD JOHNS,

Armitage Sanitary Works,

NEAR RUGELEY,

STAFFORDSHIRE.

our attention is a Richards' patent morticing machine, fitted with a chisel for withdrawing the chips. Here are also circular and band saws, a double-spindle moulding machine, a routing machine by George Richards & Co., and adjoining this a six-spindle boring machine by the same makers. At the other end of the shop is a 4-foot circular saw, fitted with self-acting rope gear. Opposite this is a deal frame saw. In this part of the shop is also a planing and trying-up machine, a three-spindle boring machine, a heavy morticing machine, and a cross-cut saw. We must not forget to mention an American rack saw-bench by the Lane Manufacturing Company, and which is capable of carrying a 66-inch saw which runs at 500 revolutions per minute. It has levers set and a very fast return feed. All the sawdust, &c., is automatically conveyed by a fan to a collecting tower, from whence it is utilised to raise steam in one of the stationary boilers. The whole of the shafting for driving the various machines is fixed below the floor, which arrangement keeps all the driving bands out of the way, and does not necessitate the use of countershafts.

Leaving the saw-mills we proceed to the carriage machine shop, which is 194 feet long and 57 feet wide. We here find numerous drilling, nut-tapping, shaping, and slotting machines. In this shop the line shafting is carried on cast-iron columns, and is driven by a vertical engine which is coupled direct. The far end of this shop is utilised as a grindery, in which are fixed five 7-foot grindstones. Twist, drill, and slide-bar grinding machines are also to be found here. The Baker's patent blowers for supplying the air to the various smiths' shop fires are fixed in this shop. Again crossing the traverser road we enter the carriage smithy, which is 176 feet long by 51 feet wide. Here are eight steam hammers, the majority of which were made at Nine Elms. These are used for stamping small forgings when required in any quantity. Also three saws for cutting hot iron, which have a lever feed. There are in all twenty-three smiths' fires, inclusive of bolt-making furnaces, arranged on either side of the building. Resuming our journey we make our way into the new running shed, passing on the way the brick factory, in which is made the fire-bricks for the brick arches of locomotives and furnaces at Nine Elms. The running shed is 235 feet wide by 180 feet long, and is capable of holding sixty engines. It is served by a 50-foot hydraulic turn-table. In this shed is fixed one of Pooley's weighing machines. Making our way from here into the old running shed, we find that several of the roads are used for lifting purposes. There is a machine shop attached for ordinary running

repairs. This shed is served by two 42-foot hydraulic turntables. Leaving here we proceed up the steam traverser road and pass through the carriage repair shops, which consist of two bays, each 254 feet long by 57 feet wide. These do not call for any special remarks, so we continue our journey to the carriage paint shop, which is a well-lighted building 210 feet long by 151 feet wide. It affords accommodation for painting between 60 and 70 coaches, and is heated on the "Perkin's" principle. Adjoining this shop are the waggon repair shops, consisting of two bays, each 208 feet long by 57 feet wide. Above these are waggon building and carpenters' and finishers' shops, a corner of which is utilised as a paint store, fitted up with the usual paint-mills, &c. On the same floor is the tinsmiths' shop, trimmers' shop, and general offices, including the drawing office, which is well lighted and fitted with twelve benches. Underneath these are the carriage repair and wheel shops. They consist of three bays, one 18 feet, and two 57 feet wide by 130 feet long. In the wheel shop are ten carriage and waggon-wheel lathes, and hydraulic press and pumps for putting on and taking off wheels. In the bay adjoining this is fixed a multiple spindle drilling-machine for Mansell's wood wheels, which tightly locks the wood segments together and drills all the holes, including the centre large one, at one operation. Also two straight axle-lathes and two wheel-boring lathes. Beyond these shops are two sheds, one for lifting carriages, and the other for lifting waggons. At the east end of the works, *i.e.*, towards Vauxhall Station, is situated a large shop, 225 feet long by 170 feet wide, in which is made the road vans and out-station furniture, and attached is a small saw-mill and smithy, with the necessary tools for quickly despatching this class of work; the remaining portion of the shop being utilised for light repairs and painting of coaches. Four of the arches under the main line are fitted up as dining halls for the workmen, the remainder being used as shops and stores. The South-Western Railway has now in operation about 850 miles of line, which is served by 550 locomotives, 3,000 carriages, and 8,000 waggons.

### BUILDING IN GLASGOW.

STONE FIRMS.

and stores; 111 alterations on additions to properties, and 3 new streets—the total estimated value being 390,320*l*. This shows a slight decrease in number and value as compared with the previous year. Only in two cases have plans been submitted for houses of four and five rooms or upwards; the applications for small houses of one or two apartments have largely increased. This increase has been going on steadily since 1882, when the number of workmen's houses then intended to be built contained only 240 apartments, viz., 41 of one room and 199 of two rooms; whereas this year the number of rooms in similar tenements runs up to 926, viz., 233 of one room and 693 of two rooms.

### PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Cassell, Consulting Patent Agents, 43 Southampton Buildings, Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

#### APPLICATIONS FOR PATENTS.

13632. Robert Platt, for "Improved automatic retaining catches for doors, windows and such like purposes, to be called Platt's automatic retaining catches." September 21, 1888.

13633. William Charlesworth, for "Improvements in window fastenings." September 21, 1888.

13645. George Major, for "An automatic air lamp." September 21, 1888.

13647. Henry C. Montgomery, for "Improvements in sewer-gas traps. (Complete specification.)" September 21, 1888.

13654. Comyn Ching, for "An improved noiseless chimney-breast ventilator." September 21, 1888.

13696. Charles Herbert Scott, for "Improvements in brick kilns fired by gas." September 22, 1888.

13700. Robert Middleton, for "An improved mode of securing windows, shutters, doors and the like, such as slide in grooves, and appliances connected therewith." September 22, 1888.

13721. Walter Chidwick Nangle, for "A new or improved

composition of paint, to be used for coating and preserving metal, wood and other substances and materials." September 22, 1888.

13731. Emil Heinrich Conrad Oehlmann, for "Improvements in or applicable to pumps." (Complete specification.) September 22, 1888.

13735. Jacob Ayton Archer, for "The manufacture of an improved material suitable for roofing purposes; also for advertising purposes, door panels and other purposes." September 22, 1888.

13761. Alexander Bobrownicki, for "Improvements in the treatment of towns' refuse and other putrescible matters." September 24, 1888.

13772. William Philip Thompson, for "Improvements in fastenings for doors applicable for resisting external pressure and for preventing fraudulent opening." (Fortune Terraire, France.) September 24, 1888.

13793. Charles Jones, for "An improved connection suitable for joining staircase panels or the like to the handrail." September 24, 1888.

13809. John Wilson and Alfred Richardson, for "Improvements applicable to window-sashes." September 25, 1888.

13812. James Russell Wellington, for "Saving life, to be fixed on pavement, for leaping or falling into from buildings or other places on fire or otherwise." September 25, 1888.

13844. George Lawson, for "Improvements in and relating to boxes or vessels for depositing or lowering concrete and such like material for foundations, &c., &c." September 25, 1888.

13893. Edward Ayrerst Reeves, for "Readily dividing a straight line of given length into any number of equal parts, and for measuring with precision any portion of such line." September 26, 1888.

13915. Frederick Charles Broadbridge, for "Improvements in window fastenings." September 27, 1888.

13943. James Henry Osborne, for "Improvements in sash fasteners." September 27, 1888.

#### PROVISIONAL SPECIFICATIONS ACCEPTED.

11519. John Taylor, for "Stench-trap for sewers and sewage purposes." August 10, 1888.

11589. Robert Hall, for "Improved means for attaching cords to sash-window frames." August 11, 1888.

11610. Henry Johnson, for "Improvements in bricks for pavements and floors." August 11, 1888.

**GUARANTEED CIRCULATION to ALL ARCHITECTS in GREAT BRITAIN.**  
THIRD YEAR OF ISSUE. THE

## Architects', Surveyors', & Engineers' Compendium, AND COMPLETE CATALOGUE.

EDITED BY JOHN ED. SEARS, A.R.I.B.A., F.A.S., AND C. STANLEY PEACH.

### IMPORTANT NOTICE.

The next issue will contain a **DICTIONARY OF MANUFACTURERS' SPECIALTIES**, and the Editors will be pleased to receive particulars or catalogues of goods, with the leading specialties marked. Names of approved specialties are inserted **WITHOUT CHARGE**. The special feature of the work is **THE COMPLETE CATALOGUE**, in which detailed and priced particulars of goods, with each article indexed, are brought together and classified for the reference of Architects, Contractors, and others. A large number of leading firms have already taken from **FOUR TO SEVEN PAGES EACH**, are inserting plates and lithographed designs of their goods, and many advertisers in previous issues have taken greatly increased space.

This work has the favourable recommendation of the President and Members of the Council of the Royal Institute of British Architects, and a large number of other eminent Architects. Full particulars of

**P. JOLIN & CO.,** Narrow Wine St., Bristol.

11623. William Lindsay, for "Improvements in the manufacture of supporting columns." August 11, 1888.

11663. Thomas Donnithorne, for "Improvements in the treatment of sewage." August 13, 1888.

11679. James Raper Thame, Lesser Repinski Jacobs and Thos. Griffiths, for "Improvements in cottage, hut, and other buildings of portable or temporary character, and in means and apparatus employed in their manufacture." August 13, 1888.

11715. Francis Philip Wheeler and William Owen Johnson, for "Improved method and means for instantly removing and replacing window-sashes, cords, and sash weights, for cleaning, repairs, and other purposes." August 14, 1888.

11889. Ellen Wilkinson, for "An improved window-fastener." August 17, 1888.

11896. Moses Piper, for "Improvements in instruments for measuring." August 17, 1888.

12356. Walter Berry, for "Lowering the temperature of cabins, saloons, corridors, and other places and passages on board ship; and the same being applicable for lowering the temperature of wards and rooms in hospitals, barracks, or other buildings." August 28, 1888.

12668. John Taylor, for "Stench-trap for sewers and sewage purposes." September 3, 1888.

#### COMPLETE SPECIFICATIONS ACCEPTED.

Notice is hereby given, that all persons interested in opposing the grant of a patent on any one of the undermentioned applications may, at any time within two months from the date of the official *Journal*, give notice at the Patent Office in the prescribed form of such opposition.

15453. George F. Redfern, for "Improved apparatus for giving an alarm in case of fire or other emergency, and for signalling or transmitting instruction or information relative thereto." (Louis Digeon, France.) November 11, 1887.

15477. Ch. L. Templer, for "Improvements in or relating to appliances or apparatus for raising or lowering or holding window-blinds." November 12, 1887.

10770. Henry Lee Hind, for "Improved door-fastener." July 25, 1888.

10955. Hans Henrick Schow, for "Improvements in door-stops and closers." July 28, 1888.

12107. Jos. H. Bean and William Gaines, for "Improvements in apparatus for closing doors and preventing slamming-to of the same." August 22, 1888.

#### PATENTS SEALED, SEPTEMBER 28, 1888.

11287. De Fonblanque Pennefather, for "Improvements in apparatus for ventilating rooms, chambers, cabins, sail carriage, and the like." August 18, 1887.

13877. William Bird, for "Improvements in the construction of street gullies." October 13, 1887.

7957. John B. Tongue, for "An improved appliance for preventing down-draught in chimneys and flues." May 31, 1888.

3292. John Burkhardt and William H. Jackson, for "Improvements in the manufacture of hollow ornamental studs, balusters, pedestals, &c." March 3, 1888.

#### ABRIDGMENTS.

"Improvements in stoves for heating the air of apartments, &c., by combustion of gas and air." No. 15167. 1887. William Jackson, Thorne Grove, Marnofield, Aberdeen.

*Claim I.*—A stove for heating air by burning of gas and air, consisting only of a closed chamber, with air inlet only by the burner, and with an outlet such that the heated products are not drawn, but force themselves thus through, there being passages or tubes for the entry and exit of air to be heated, substantially as hereinbefore described.

"Improvements in water-waste flushing cisterns." No. 15203. 1887. John Ward, 3 Glen Street, Hampstead Road, London.

*Claim I.*—In making inside the cistern the shape shown on drawing, and fixing axis (with overflow pipe) in a certain position, so as to make it oscillate when suspended.

*Claim II.*—In placing outlet-pipes, with small holes in same, standing up in the bottom of outside cistern, to give a quick flush and a steady after flush.

"Improvements in the production of white lead, &c." No. 10426. 1888. R. W. Emerson MacIvor, F.I.C., F.C.S., F.R.G.S., St. George's Club, Hanover Square, London.

*Claim.*—That I make carbonate of lead by the above process by causing acetate of ammonia or other alkaline acetate to act upon oxide or any other compounds of lead in vessels described and shown in figs. 1 and 2 on plan or similar vessels, and by introducing carbonic acid into the vessels containing the foregoing substances, and thereby producing the final product—carbonate of lead.

TO INVENTORS. — Patents for Inventions, Trade-marks, and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free. — Messrs. RAYNER & CASSELL, Patent Agents, 43 Southampton Buildings, Chancery Lane.

# The Architect.

## THE WEEK.

WE regret to record the death of Mr. JAMES SELLARS, of Glasgow, which occurred on Tuesday morning. The International Exhibition there, which has not yet run its full course, will always remain associated with his name. It was, too, but the other day that he was presented to Her Majesty on occasion of her visit to Glasgow and the Exhibition. Successful in his profession, that success was detrimental to the prospect of living even an ordinary span of years. His application to business engagements left him powerless when the crisis came to rally from illness. Ten days was the utmost he allowed himself, in deference to medical orders that he should take a long holiday. In his work, moreover, he was accustomed to leave no details to be carried out by others that he could find time to do himself, and at home he was often engaged in what he called his "den"—an upper room of his house crowded with sketches and other items of professional paraphernalia—till the "wee" hours of morning. A career of prolonged success no doubt awaited Mr. SELLARS could he have lived to enjoy it. Apart from professional circles, many friends will regret his loss. Some of the best of Mr. SELLARS's works have been illustrated in THE ARCHITECT.

AN appeal has been made by the Société d'Archéologie of Brussels to the communal administration, on behalf of a scheme for the restoration of the church of the Sablon. A few years back the building was little known to strangers, but the changes which were made in order to secure suitable approaches to the new law courts has brought it into prominence, as it stands on the extension of the Rue Royale, and is opposite the square called the Petit Sablon. The church is a fine example of the Gothic of the fifteenth century, and was founded by the Guild of Archers. At present the walls and columns are painted white, with gilded caps, but originally there was much colour on the walls. If the interior is in good condition, the exterior is fast falling into ruin. Until the houses around were removed the condition of the masonry could be concealed, but now it is a discredit to the parish and the city. Unless steps are shortly taken to set about the work there will be no detail to copy, and the restoration will be imaginary. The grouping of the building is picturesque, and, if properly treated, would be an ornament to Brussels.

It is now beyond all doubt that the International Exhibition in Paris next year will not in any way interfere with the annual Salon. The Exhibition will be held as usual in the Palais de l'Industrie, which is excluded from the circuit of buildings that will be used as annexes to the Exhibition in the Champ de Mars. In the latter, French art is to be shown in all its phases; but, although the pictures of the early part of 1888 are admirable, there will be no space available for pictures of the later months of the present year.

AMONG the reports for the meeting of the School Board on Thursday, was a recommendation that a reference from the Board last March, instructing the Special Committee on the Work of the Works Department to direct Mr. EWAN CHRISTIAN to examine the Whittington, Carlton Road, and Manchester Street Schools, should be discharged. Mr. CHRISTIAN submitted a full report on these buildings, but the committee were of opinion that the report did not contain all the information asked for by the Board, and they requested Mr. CHRISTIAN in conjunction with Mr. RICKMAN to submit a further report. Mr. CHRISTIAN, in the course of his reply, says:—"I reported fully on April 23 last, and, on reperusal of what I then wrote, find nothing that I can usefully add. If the Board desires to know exactly wherein the foundations of those buildings differ from what is shown on the contract drawings it can be ascertained, but the examination will involve an extent of excavation and a disturbance of surface and general

school work and organisation, such as, in my judgment, would be quite unjustifiable. I cannot think that it can have been properly understood what is really implied by complete and thorough examination of the foundations of one of these large buildings." Mr. RICKMAN expressed his willingness if so instructed to examine the accounts, but stated that it would be necessary to get all particulars of quantities and measures of variations from the surveyors, and as the quantities for two of the schools were taken out by Mr. NORTHCROFT, he had little hope of obtaining them without long delay.

THE Marché de Madeleine of Brussels is known to most visitors, and especially to students of literature, for the Galerie Boittier, which forms part of the market, is monopolised by the secondhand booksellers. The market was constructed from designs by CLUYSENAAR, the architect, in 1848. During the excavations an immense number of coins of the seventeenth and eighteenth centuries came to light. The coins were made over to the director of the Monnaie Theatre, who was an amateur numismatist, for 39,681 francs. The Municipal Council of Brussels applied the money to rewarding the four labourers who exhumed the treasure trove. A pension of one half franc a day was awarded to each of them, with a reversion to their widows and children of the age of eighteen years. All the representatives of the discoverers of the coins have passed away with the exception of one widow, who has attained a great age. The Communal Council have, in consequence of the special features of the case, increased her allowance to 400 francs a year. Did the Lord Mayor of London, or any of the spectators in the Monnaie on Wednesday night, think for a moment of the passion for numismatics of a former director of the theatre?

A NEW lycée, intended for the education of girls, and bearing the name of Molière, was opened in Paris on Monday last. Everything that is official in France is supposed to be perfect, and in order to prove that the identification of the school with the playwright is correct, speeches were made at the opening to show that the purpose of MOLIERE'S comedies was to demonstrate the necessity of the education of girls in secular schools! It is evident that Paris has lost not only its old logic, but its sense of the ridiculous. However, with all its absurdities, the ceremony and the speeches brought the "palmes académiques" to M. PROUST, the architect who has been the representative of M. VAUDREMER in the direction of the works. The new school consists of four buildings of no more than two storeys in height, which are connected by a covered gallery on the ground floor, that will form an excellent ambulatory, unless at times when the rain will be driven into it. The ground floor is appropriated to classrooms (in which chairs are substituted for benches), a dining-room, kitchen, &c., and the first will be used for drawing schools, rooms for study, caretaker's offices, &c. The school will accommodate 350 students.

ON Monday next the Ecole des Beaux-Arts in Paris will open, and it is calculated that no less than 1,200 students will be present. Architecture can claim about one-half the number, painting has 400, sculpture 200, and engraving twenty students. As the students are expected to attend all the classes some of the architects may become fascinated with painting, or *vice versa*. Architecture is directed by MM. ANDRÉ, GINAIN and GUADET, and sculpture by MM. CAVELIER, FALGUIÈRE and THOMAS. Owing to the death of M. BOULANGER, there are only two professors of painting at present, MM. CABANEL and GÉROME. To fill up the vacant professorship a meeting of the Council of the Beaux-Arts has been summoned. If the interests of the students are alone considered the appointment should be given to M. JEAN-PAUL LAURENS. Artists are not decided about the merits of his work, which is, indeed, beyond the appreciation of the ordinary patron of art. But M. LAURENS is, in addition, one of those men who have an infinite capacity for taking trouble. If any of the members of the Council have observed M. LAURENS scrutinising pictures in the Salon as one of the jury, they must know that no less care will be taken to discover the good and bad points in the drawings of students.

### THE RETROSPECTIVE EXHIBITION IN BRUSSELS.

IT was inevitable that the law of compensation, which seems to be nearly as regular in its working as the law of gravitation, should prevail in connection with the Reformation in England under HENRY VIII. If there were gains there were also losses, and among them were many in connection with art. England, by the Act of the King, was severed from those parts of Europe where art was the most perfect, namely, France and Italy. The old traditions of design were set aside, and something had to be attempted, of which the weakness becomes manifest if we compare Elizabethan with Tudor ornament, or an old chalice with a reformed communion cup. Some notion of the extent of the destruction of works of art in churches, monasteries and nunneries may be derived from the notes of King HENRY's commissioners. About what was sacrificed in private houses we have no record. We may be sure that in England people were as much disposed as the Catholics throughout Europe to preserve things which were connected in some way with their religion, and which were, it may be assumed, as beautiful in form as similar things in churches. But few would care to oppose the King's will for the sake of a carving in ivory or a reliquary in metal; and, besides, from the change in belief objects of the kind lost their importance. That there was a general clearance of treasures which had passed from generation to generation as heirlooms in families is evident from the rarity of examples in the Mediæval metalwork, painting, sculpture, embroidery or illumination of England in public and private collections.

The beauty of the works may be taken for granted. In those days architecture was a power, and the details of a cathedral or a church served for models to the metalworker and the carver. A single example in the Brussels Exhibition reveals how great was the skill of the English goldsmith at a time which was supposed to be one of decadence. It is an ostensor, or monstrance, which is said to have been presented to the church of Notre Dame at Hal, by HENRY VIII., about 1513. It is almost entirely made of silver, and evidently parts are a direct reproduction from some English church. The King would hardly offer a work which was not made by one of his subjects; and, if so, it is evident that, in the early part of his reign, there were craftsmen who could execute work of a most refined kind, and, indeed, this English specimen, despite its colour, holds its own in the midst of a long range of ostensors. Yet, in a little time after he produced it, the artist must have discovered that his occupation was gone. A man who dared to make monstrances in London after the King had ceased to prize them, would soon discover that art was no protection.

The Belgians have been more successful than most peoples in preserving examples of Mediæval art, and a vast number of works in various materials can now be seen in Brussels, in an adjunct to the International Exhibition of modern industry. Although Mediævalism may be most largely represented, it does not, however, monopolise all the space. The periods of the history of industrialism are more or less exemplified. The first case in the Exhibition contains specimens of the attempts of prehistoric man to employ stone and metals for his needs, and the course of craftsmanship is followed down to a time which may be called recent. As a rule, there is some affinity between the contents of a case. In addition, there is a section which is arranged in a series of rooms in order to suggest the kind of furniture and ornaments which were in use at different times, or were characteristic of a town or province. There are *salles* for the fifteenth, sixteenth, seventeenth, and eighteenth centuries, a "salon Liégeois," a compartment devoted to arms, a "cuisine," &c. As the part of the building in which the Retrospective Exhibition is held is curved on plan, it appears to be larger than it is in reality, and it must be said that little space is left for visitors.

A collection containing about four thousand objects, and not one of them wanting in interest, is not to be adequately described in an article. All we can do is to point out the general characteristics of the Exhibition by alluding to some of the more remarkable works.

It is not necessary to say much about the prehistoric

parts. The early stone weapons have little variety, and to see one case containing them in a museum is to see all. Belonging to a later period is a remarkable and very large funeral urn, which evidently belonged to a woman who was distinguished, as a sort of diadem was in the urn. There was also something more prosaic in the form of a large bone, from which the flesh had parted, and which may have been intended as food in the peregrinations of the defunct through the unknown world.

The district about Namur has been well worked by a local archæological society, and some of the remains exhumed form an interesting collection. It denotes that at an early period the art of enamelling was applied in Belgium for ornamentation of brooches, rings, and bracelets. It may have been derived from the Romans. The ornamentation is generally of the interlaced patterns which are associated with Celtic and Norse work. But it must be said that the lines are rarely graceful, and would seem to be derived from descriptions of patterns rather than from the patterns themselves. The colour is always excellent, especially in blues, and the paste is even in texture. It is apparent that at an era which was prior to the introduction of Byzantine enamels in Western Europe the Belgians were skilled in the chemistry of fluxes, and in the arrangement of the partitions or cloisons.

At a much later period Namur seems to have again succeeded in enamelling, that is, if we assume the triptych in another case to be produced in the district. In it we see an example of translucent enamel, which at one time was in favour for reliquaries in Belgium. From Namur, also, comes a most delicate statuette of a bishop in a shrine set with coloured stones, which are also introduced in the drapery of the figure, one being at each fold of the amice. Through the influence of BALDWIN in the Crusades, Belgium was enriched with many examples of Byzantine art, the dragons on church spires being supposed to be among them. A crown set with precious stones and ornamented with filigree from the Cathedral of Namur, is described as being brought from Constantinople in 1205. In "Baedeker" the date is said to be 1429. There is also a fine case for the crown, which, too, is evidently Byzantine work; the top is adorned with medallions. Ivory tablets for writing, like those seen in the Namur case, are very rare, but of the small cradle (which like most Mediæval work is highly coloured and gilded) there are other examples in the Exhibition. They are generally about a foot in length, and from their preservation it is reasonable to imagine they were used to recall the Nativity rather than as playthings. In some a small figure is placed which is evidently of a later date.

But none of the contributions from Namur can compare, if judged as works of art, with a collection from a nunnery in that town, all of which is said to be the work of an Augustinian monk (VAN DER GOES, the painter, belonged to the same Order) named HUGO. He was one of the artists who lived in the early part of the thirteenth century, and if it were asserted that he was the greatest of the men who worked in the precious metals at that time, it would be difficult to bring proof to the contrary, or, in other words, to discover objects which are superior to his handiwork in this Exhibition. In no museum have we seen greater finesse in the treatment of vegetation and of small animals, or more perfect curves in rinceaux. One work is enough to suggest his skill as an artist. A four-armed Byzantine cross, most refined in its enamel, medallions and filigree, was given to him in order that he might make a base for it. He recognised the beauty of the Eastern work, but he did not attempt to imitate it. Hugo entered into competition with it; he applied Gothic ornament equally minute and no less beautiful. A missal painter might envy the delicacy of the detail which he introduces. But he was equally facile in different works. The large chalice or ciborium (No. 153) is a model from its proportions and contours. On one of the ornaments of a book of Gospels, Hugo has introduced a figure of himself in a circle of about the circumference of a shilling. He is kneeling, and holds the book with extended arms above his head. On the opposite side is a medallion showing St. NICHOLAS seated, to whom the book is supposed to be offered by the monk. A phylactery, which probably is used as a breastplate for a cope, suggests how well he succeeded in works which were to be magnificent. A cross and two fine

reliquaries belonging to the church of Walcourt are attributed to HUGO. Treasures of this kind are found only in places which are closed to the tourist in Belgium, and their appearance in an exhibition is a boon for archæologists of all countries.

Two of the finest "châsses," or coffers for relics, in Europe are those of "Saint Hadelin," belonging to Notre Dame in Huy, and "Saint Maur," lent by the Duc DE BEAUFORT. The former has the appearance of a work in bronze, ornamented with flowing lines in gold, and, it is said, dates from the beginning of the twelfth century; but some archæologists maintain that prior to the thirteenth century the châsses were simple in form and were coffins rather than coffers. The Huy châsse wants the ornaments which were formerly on the sloping roofs, but fortunately the figures on the sides are preserved in their simplicity. On one of the ends is a figure of CHRIST, who holds a globe, and is represented as beardless—a departure from the usual practice of the West. The châsse de Saint Maur is startling in the brilliancy of its gold plates, and one wonders how it could have withstood the vicissitudes of seven centuries without having a stain. It has the figures on the roofs as well as on the sides, and in style of treatment is not unlike the châsse from Huy. Both works have more of the Romanesque vigour than of Gothic delicacy. There are other châsses, but they belong to a later period.

Several crosses, having a variety of forms, are placed together. Those numbered 39, 43, and 44 have each four arms, and consequently resemble the crosses used in the Greek Church and the pectoral crosses of Western archbishops. One cross is a sixteenth-century Italian work, with ornament of nielli, which is charming in its detail, and without any of that suggestion of being manufactured which sometimes characterises Italian work. The ostensoirs, which are used for the ceremony of the Salut in churches, show a variety of forms, but all are now superseded. The form in use may have been suggested by phylacteries like the one by HUGO already mentioned. The largest is the ostensoir of HENRY VIII., but from the mass of silver it looks cold when seen beside its golden companions. From the thirteenth to the sixteenth century the aim of the goldsmith was to make the ostensoir a sort of shrine, and in that view the architecture of the time was faithfully imitated. Probably they were all designed by architects, for as late as 1708 we find an architect supplying a design for the great ostensoir which is in Notre Dame, Paris. In many of the encensoirs, or thuribles, we also see the influence of architecture. It was supposed that no better plan could be devised for the passage of the smoke of incense than by having an imitation of windows full of tracery. One thurible was evidently derived from one of the German Romanesque churches. Looking at these examples, it is evident that the furniture and accessories of the Mediæval services bore a close relation to the building in which they were employed. It was again reproduced in the reliquaries which were found in houses, and in this way architecture exercised its sway not only over societies, but upon individuals.

According to M. VITET, there is also a close connection between the architecture of a period and the style of calligraphy then employed. But what is more likely to strike a visitor on seeing the illuminated manuscripts at Brussels is the brilliancy of the colours and of the gold. They might have been finished yesterday, so few are the signs of age on the drawings. Does not the condition of the manuscripts suggest that water-colour drawings should not be exposed to strong light? The illuminated volumes are generally kept closed or covered, and they continue to be as unchanged in colour as in outline. Some of the manuscripts were originally in the library of the Ducs DE BOURGOGNE. An Italian missal which belonged to MATHIAS CORVIN, King of Hungary in the fifteenth century, shows figures well executed, but they lack the *naïveté* which generally characterises the Western illuminations. One manuscript is open at a place where the letter "C" is formed by a combination of the four Evangelistic symbols. In another ADAM and EVE are seen standing at the foot of the Cross. There are two splendid examples of Eastern illumination, which by some people may be considered as superior to those from European monasteries, as

the ornament is entirely conventional and without any figure pieces. It is impossible to say whether the Eastern or the Western colours are more perfect in condition. One belonged to SHANK NAMAH DE FIRDOUSI XVI., a name which recalls "Lalla Rookh." The other is from Persia, having the ornament in blue and gold. It was a present fit for a king.

Many grand specimens of the reredos are to be met with in the Exhibition. Lombeek is not a place lying in the route of the traveller, but it contained a remarkable specimen of a reredos which is now in Brussels. It represents the life of the Blessed Virgin in a series of deeply-sunk panels, with figures in high relief, and which are most animated in action. The care taken to represent the architecture, furniture, &c., was a recognition of the importance of art in those days. Near it is a crucifix of large size from the church of Oplinter, and which is supposed to date from the thirteenth century. The colour and expression of the life-size figure are most vivid. This work is more effective than many of the modern representations of the Crucifixion, where the figure of CHRIST is detachable from the cross, yet it will be found that the figure is in low relief, and carved from the same piece of oak as the cross. The arrangement and the colour are so contrived as to produce the effect of very high relief. Many smaller reredoses and carvings are shown. One group in relief bears a resemblance to a similar scene by MEMLING in St. John's Hospital, Bruges. Among the statuettes is one which is covered with plates of thin copper that are beaten to correspond with the work beneath. It is evident that long before St. SEBASTIAN became a stock subject with Italian painters, he was selected by the Belgian wood-carvers. From Notre Dame (the cathedral) of Antwerp comes a statuette in which CHRIST is shown playing with His mother's cheek, probably the earliest example of that sort of action. But among all the statuettes of the *Virgin and Child* in the Exhibition precedence must be given to one in ivory belonging to Baron OPPENHEIM. Less care seems to have been taken with the figure of CHRIST than with the Blessed Virgin, to whom the sculptor imparted the placidity, the silence, the mystery of Egyptian sculpture. The treatment of the drapery adds to the effect produced by the expression of the face and the pose of the figure; it is in large folds unless near the shoulders, where it is tightened to express more power. The statuette is ascribed to the fourteenth century, and if similar style could be adopted in our modern imitations of Mediæval sculpture, there would be no more cavils about distorted saints. A thirteenth-century statuette of the Blessed Virgin in the same case is a realisation of a still more severe ideal.

The lutrins, or lecterns, merit a word. Those having an eagle for supporter are most common. There is one with a pelican from Tirlemont. Another rare variety is the griffin lectern. One from Andenne is so powerful as to suggest that the designer intended to suggest an evil spirit. Paschal candlesticks, lustres, and chandeliers will be found near the lecterns.

Vestments, altar-frontals, tapestries, carpets, embroideries, &c., fill many cases in the Exhibition, and there are several examples of stuffs from Eastern looms. It is plain that after the Crusades the countrymen of BALDWIN of Flanders recognised the advantages of traffic with the East. Seeing the richness of the old textiles in the Exhibition, it is not difficult to imagine the fine apparel of the Belgian ladies at one time, and which wrung the confession from JOHANNA of Navarre, that she was no better dressed than the women of Bruges.

The secular work is abundant. A favourite Mediæval legend is recalled by the group of ARISTOTLE and his mistress, an allegory of the servitude of man. M. ZSCHILLE has a collection of over 700 knives, forks, and spoons, representing a chapter in the history of evolution. The collection of *argenterie de table* is worthy of a country which at one time was remarkable for its wealth. Amateurs have contributed specimens of Belgian and German glass; the watches which the Marquis DE RODES bequeathed to the Museum of Antiquities are now in the Exhibition, and no less interesting are the French watches of the sixteenth century. Several interesting *bijoux* come from the stores of Mr. EDWARD JOSEPH, including some miniatures by COSWAY. Among the bronzes is a noble figure of *Neptune*,

by JOHN of Bologna, and a *Perseus*, which is attributed to BENVENUTO CELLINI.

A new world seems to be reached when we come to the cases containing examples of Sèvres and Chelsea ware. As was to be expected, the collection of delph and other Belgian faïence is very large; but it must be admitted that whatever may be our shortcomings when compared with the past, there is nothing in all the cases which in design will bear comparison with the faïence of Messrs. DOULTON. The beautiful statuettes in white porcelain suggest how much is lost in England by neglecting this branch of art, although at one time Alderman COPELAND demonstrated that English porcelain was not to be surpassed by any from Saxe or Vienna. As long as Japanese monsters are accepted as the highest ornamental art it would be vain to hope that sculpture will be popularised in England.

To virtuosos the musical instruments will be the most attractive. Among them is a violin which is one of the last made by old STRADIVARIUS; another by the same maker, which belonged to PAGANINI; a viola-de-gamba, which was made for FRANCIS I.; a lute belonging to M. EMILE WAUTERS, and which may have served as a model for one introduced in his painting in the Brussels Musée; two virginals, &c.

Space will not allow us to describe the Exhibition at further length, but it may be said that in variety and interest it surpasses the first of the exhibitions of loan collections at South Kensington. The authorities have wisely decreed that an extra fee must be paid for entrance to the Retrospective Exhibition. In consequence the galleries are never crowded, and students of archæology, artists, and amateurs are able to examine the treasures at their leisure.

### MISTAKES IN ARCHITECTURE.\*

BY PROFESSOR T. ROGER SMITH.

(Concluded from last week.)

#### Architects' Mistakes.

WE have now reached architects' mistakes, and there seems to be good reason for occupying such time as is left chiefly with mistakes in practice. Still there are one or two remarks on design which I am tempted to hazard, and which I think can usefully be made. Remember, then, that it is a great mistake to attempt in designing to use what you do not understand. Just as in Egypt the captive Israelites could not make bricks without straw, so you cannot design without materials, *i.e.* without being familiar with the forms, features, and ornaments of the style in which you are working, and with the manner in which those elements have been put together by successful architects before your time; and without, moreover, being practised in the application of that knowledge.

If you want to see examples on a large scale, numerous, costly, and distressingly instructive of what making architectural bricks without this sort of straw comes to, just walk through the various streets and courts of the City of London. Side by side with some of the best buildings of our best architects you will see costly works, substantial and pretentious, designed by men who can have had no intimate knowledge of, and scarcely any training in, our art, and who have in most cases been employed because they were known to moneyed men as trustworthy surveyors. Such have doubtless built soundly, but their works are architecturally failures. Getting together this straw—to return to the old figure—is no easy task. It takes a long time and a good deal of pains to gather information enough, and to develop skill and experience enough, to make a really good architectural design, and to work it out in all its details; yet it is unwise to start practice till this can be done. Sometimes circumstances or the offer of work render it almost necessary for a student of only a few years' standing to begin on his own account; but it is very rare for those who start prematurely to succeed in doing good architecture, unless they have the resolution, after completing their first works, to stop, and go abroad and finish their studies and then come home and resume.

I am tempted to add that a new style is a mistake; not that a new style is in itself impossible, but that it is impossible to you or me. It is idle to suppose that the genius of any one man could successfully work out a new style that his fellow-men would feel to be appropriate. Looking round on the motley variety of styles which prevail in modern Europe, we are tempted to believe that it is a matter of no moment what

style be brought in and used. Yet a little observation will show you that it is not so. No architectural style is practised in England (to limit our notice to the country under our eyes), various as the styles that are or have been in vogue may be, unless its roots are deep and wide in the history or the sympathies of the English people. Greek, which was the style of our grandfathers' time, was welcomed at a time when every man of education in England was, or wished to be thought, a Classical scholar. Scholarship is on the wane and there is now scant encouragement for the practice of Greek architecture, though to learn it is as needful as ever. Italian Renaissance is intimately connected with modern as distinct from Mediæval feeling and life, and has become universal in this as in other countries of Europe, just because it is identified with that which England has in common with every modern European country. Gothic is the architecture which was a native of this country during the whole of the Middle Ages. Queen Anne is Dutch architecture, and belongs to a set of things which became incorporated into our national life at the Revolution, when Holland gave us a king. There have been, on the other hand, various attempts to introduce other styles with which there exist no such links, but the attempts have failed. For example, no permanent result followed the efforts of that most able architect Owen Jones, to introduce Mahomedan architecture into this country—efforts in which he was virtually without followers. If there is any truth in these views, and I believe there is no gainsaying them, we have no reasonable ground for supposing that a new style could live and thrive, even if a great man had the genius to devise such a thing. If it comes it will grow, not be made.

Every apparent novelty in architecture should be viewed with great distrust, as more likely to be a mistake than a success. That novelty is both possible and desirable is self evident, but beware of what seems to you to promise to be extremely and strikingly novel. It has probably been tried before and given up as less good than the received way, or, if that be not the case, still there is great risk of its being the blemish instead of the blossom of your work—a mistake instead of a discovery. The one defect of importance in St. Paul's Cathedral occurs at the crossing of the main avenue and the transepts—the one part where its great architect has departed most widely from the practice of other church builders, and has, in the search for novelty, sacrificed more than he has gained, clever though the disposition of the piers that carry his dome undoubtedly is.

#### Mistakes in Practice.

In practice—that is to say, in the practically carrying on of the profession of architect—no more grievous mistake can be made—nay, I think, none so grievous—as taking bribes. An architect who accepts illicit commissions, or does nominal work for large fees, or who allows any other of the expedients by which receiving a bribe is made to look as if it were a business transaction, to be practised upon him, has sinned against the very first duty of a professional man; he has sold that independence which ought to be his most cherished possession, and has put himself under the thumb of the very persons whom he ought to control. The wisest of mankind says, "A gift destroyeth the heart," and it is not possible to be more forcible, more terse, or more true. There are sure to be times when very specious proposals will be made to most of you, and when it may appear almost quixotic to decline money which you sorely need, but whenever any case occurs in which you honestly doubt whether the transaction is one for you to agree to or not, I will suggest a practical test. Imagine yourself cross-questioned as to the entire affair by some such master of the art as Sir Henry James, before Mr. Justice Hawkins and a jury in open court, and if you at all doubt whether you would come off with credit, pray take that as an indication that the doubt is well founded, and the proposed transaction should be declined with thanks.

Anything that is in any way unfair is a mistake as well as reprehensible. It is wrong; it is also bad policy. Believe me, there is no truer word than that "Honesty is the best policy." It is both dishonest and a mistake to get work away from a professional brother, or to undersell the profession by working at a rate below the recognised and fair rate, and it is equally a mistake to overcharge a client. Either of these may be expected to bring an inevitable train of bad consequences, a retribution, in its wake. It is generally speaking a mistake to work for nothing. You may occasionally do it in the case of charities in which you are interested, but I think a guiding rule should be not to do it in any case except where the work is so in your own connection that under any circumstances it would come to you. To do work for nothing, and thereby deprive some other architect both of the work and the fees, is extremely bad.

I think there remains no worse mistake to note than temper. Temper is a mistake—a ship without a rudder, a horse without a rider, or a stream that has burst its banks, are apt illustrations of the condition of a man of business who

\* Opening lecture at the commencement of the Session 1888-89 at University College, London.

has lost his temper. Above all things an angry letter is a mistake. Make it a rule never to write a line while you are angry; for, somehow, an angry man's pen seems dipped in permanent gall rather than ink, and his written words unluckily have not the same chance of being either promptly answered, and then forgotten, or good-naturedly overlooked, that hasty spoken words often have. A letter written in heat is read, you must remember, in cool blood. If something raises your wrath, and you sit down and fire off a withering epistle, the best thing you can do is to put it in the fire there and then; the next best, to keep it twenty-four hours, and then reconsider it; and the next best, to show it to a judicious friend.

One in high station, who had been much irritated, and had written a splendid and stinging reply, took it to the most influential man whom he knew. The chief—I think it was Palmerston—read it right through without a word, “Got a copy of this letter?” “No.” “Not even a rough draft?” “No. I wrote it straight off.” “Very injudicious letter. Much better burn it”—and, suiting the action to the word, the great man put it into the fire, and coolly held it there with the poker till there was no shred left. That was the action of a true friend.

I must, at the same time, point out that just anger is not the same thing as giving way to temper. The ability to exhibit indignation at the right moment, if kept perfectly under control, is very useful to one who has to supervise works or direct men. The just anger of a superior is generally dreaded, and to an extent far beyond what one would expect or can quite explain. If, therefore, you are able at the proper moment to show an offending artisan, foreman, contractor, or tradesman, that you are justly and with good reason roused to anger, it will generally help you in the control of the works under your direction.

My reference to an angry letter as a mistake makes it suitable here to add that we are liable to make mistakes by writing where we ought to speak, and speaking where we ought to write. Writing is quite permanent; therefore it is far more fit than our fading memories to record anything that should last. It is quite inelastic, quite unyielding; so it is unfit for anything of the nature of give-and-take. In all negotiations, explanations—above all, whenever there is a difficulty or ground for dissatisfaction—see people, at all sacrifices, in preference to writing them. At such times it is a mistake to write. On the other hand, if any specific order has to be given, if any definite objection or complaint has to be made, or if any agreement has to remain in force for any length of time, it is equally a mistake not to put it in writing. Your order, your complaint, your contract may often be originally done by word of mouth; but, in such cases, they should be afterwards repeated in writing, for accuracy's sake.

In architectural practice delay is a mistake. It is not always possible to be prompt, but it is far more possible than persons who habitually procrastinate are willing to believe, and from first to last it will greatly add to your chance of success if you are prompt. At the first inception of an undertaking, whether the client be eager or the reverse, it is equally prudent to do some thing at once. The eager client is balked if he find nothing done after a short time, perhaps changes his mind as to doing the work at all, or more possibly changes his architect. The lukewarm and indifferent client, who might by a promptly-prepared sketch have been encouraged to go on, is disheartened, or turns to something else, or postpones or abandons his intention. Were I to trace the work of an architect all through, it would be easy to show that at every succeeding stage delay is a mistake, though I am bound to admit that it often can hardly be avoided. Carelessness is a mistake, and one into which not a few men are apt to fall. The saying is attributed to Goethe, that “Genius is the art of taking pains.” The common notion of genius is that it can do without taking pains. I do not ask you to accept this definition of genius as exact, but it covers half, and more than half, of the truth, and it would, I think, be perfectly true if you altered the wording and said, “The secret of success is the art of taking pains.” Watch a successful man in the exercise of his art or pursuit, whatever it may be; you will see him all attention, all devotion to the business in hand. Consult an eminent physician, and you see by his questions, his air of concentration, his whole method, that for the time being your constitution, your ailment, and what to do for you in order to relieve you, occupy his entire and undivided attention and thoughts. It is chiefly this habit and power of concentration which has made his pursuit of medicine successful, has enabled him often to baffle disease and restore health, and has gained him reputation.

Read any good life of any prominent public man (as, for example, read Mr. Street's life lately published), and you will see what incessant, eager toil and watchfulness occupied every hour of his day, and his night too. Nor is it less easy to remark in recreations that success can only be secured by great pains, however clever you may naturally be. Watch an angler who is known to be habitually successful, his keen attention, his constant thoughtfulness about tackle, flies, water, the

long hours he will devote to fishing, and the eager pursuit of his game. A champion player in any athletic game, rowing, cricket, tennis, football, rifle-shooting—what constant practice! what a watchful eye for every turn of the game, every detail of the pursuit! Now if you are to be successful in architectural practice, you must set about it in the spirit, temper, and method of Grace at his cricket, or Renshaw at his tennis, or a Queen's prizeman at his rifle range.

It is, however, possible to throw one's self into the interesting part of a pursuit, and to remain indifferent to details that do not of themselves attract or that seem insignificant. This, though of course better than being languid and careless about the whole business, is likely to lead to trouble. In the conduct of works, then, it is a mistake to neglect small matters, though it is equally a mistake to fuss. There are plenty of proverbs to enforce the importance of apparent trifles:—“Take care of the pence, and the pounds will take care of themselves”; “Do not lose the ship for a ha'porth of tar,” and so on. In every building there occur a certain number of apparently little points which must receive the architect's careful attention, but which one is naturally more inclined to leave to others or to chance than the questions that affect large parts of the fabric. The difference between the important and the unimportant does not, however, lie in their magnitude, or their cost, or their conspicuousness. Take a gold watch: the most conspicuous and the largest part of it is the case, and whether it be the most expensive part or no, it is certainly of the most expensive material, while the hair-spring is barely visible, of a cheap metal, and, compared to the case, of little money value; yet you may batter the case about, or deface it in a hundred ways, and the going of the watch may escape, but you cannot in the least interfere with the hair-spring, not in the most minute particular, without impairing the accuracy of your timekeeper or stopping it altogether. In a house it is much the same. The main walls are a costly part of the building, but they may be considerably damaged, decayed, or mutilated without a tithe of the inconvenience to the inmates which will occur if their chimneys smoke, their taps yield nothing but lukewarm water, their ovens will not heat, or the water runs off from their cisterns. The same thing is often true of the artistic effect of your work. You have, let us say, a Gothic church in hand, and labels over the windows springing from carved bosses. You carelessly place the bosses below the springing line instead of above it, or you in ignorance draw them so. That small blunder produces exactly the effects on the eye of a cultivated observer that would result to his ear from your talking about *hart* or *harchitecture*, and, in its way, the proper placing of that one detail is as essential to the success of the design as the most ambitious or elaborate of its features. It is therefore a mistake to consider that any single thing essential to your building is unimportant or may be safely neglected.

There is, however, an opposite: fussiness is a mistake. It is fussiness to visit a building too constantly, or to interfere for the sake of interfering. You must not forget that if as architect you have the power of making alterations, every alteration, even if it be an improvement, means delay and expense, and that delay and expense are among the worst evils that can afflict a building. One of the most troublesome and unsatisfactory disagreements I ever had to unravel grew out of the architect, a man of real ability, having little other work in hand, paying a visit at least every other day to the works, and never going without ordering something to be done or undone. The accumulated effect of these orders was months of delay and claims without end for extras, while for all practical purposes the building would have been quite as serviceable if carried out exactly as shown in the original plans and specifications without any of the modifications and improvements.

I am quite aware that one cannot expect people's minds to cease working when once a contract has been signed, and that it is proverbially “never too late to mend”; but, on the other hand, you may “buy even gold too dear.” “A rolling stone gathers no moss,” and there are few improvements which are really worth the cost, delay, and annoyance that come of interfering with a contract which has once been settled and accepted. In short, generally speaking variations are a mistake.

Mistakes in dealing with your clients are especially to be guarded against, because they generally injure your prospects in life, yet they may occur in so many different ways that it is impossible to catalogue them. Many if not most instances of miscarriage between clients and their architects appear, however, to start from one root, namely, from mistaking the duty you have to discharge, or forgetting to keep up the proper relation of architect and client. Your duty may be described thus: to form a correct idea of what your client wants and wishes, and to do your best to obtain it for him. Your relation to him is purely professional and not that of friendly intimacy, or equality, or good fellowship, or boon companionship. There are cases where an architect forms an idea of what a client wants, but which does not correspond to his wishes, and then there is sure to be dissatisfaction. There are cases where an

architect forms a notion of what a client wishes, but fails, till too late, to realise that it is not what he wants. The result again is dissatisfaction. There are cases in which the architect troubles himself little about either the wants or the wishes of his client, and works out what in his judgment they ought to be. Same result. Lastly, it has sometimes happened that the architect and the client, or one of them, have forgotten to maintain their intercourse on the proper professional footing, and if any cause of disagreement arises these cases end in the bitterest of quarrels. Professor Cockerell—a prince of architects—used to say to us, “Be a gentleman among artists and an artist among gentlemen.”

As one illustration of perhaps the most common form in which this sort of misunderstanding of the architect's duties develops itself, I will take the case of a dwelling-house. The architect busies himself to learn what his client's wishes are, and he takes no small pains to put them into shape, and he, perhaps, designs something which is very like what his client would like. But he neglects to realise exactly what his client wants. Let us suppose that his client is a man of moderate means, who cannot trench upon his income, and who has, let us say, 2,000*l.* to spend, and that what he really needs is the best house that can be had for a couple of thousand pounds, all which his architect might have found out had he taken the trouble. When the lowest estimate for the design comes in at over four thousand, the whole thing is abandoned in chagrin and disgust, and the architect too late realises that he ought to have found out what his client needed as well as what he wished.

The relationship between client and architect involves the necessity sometimes of very plain speaking, and the more thoroughly professional the bearing of the architect has been, the more thoroughly is it possible for him to discharge this sometimes painful duty with perfect effect. For example, in the case I have suggested, had the architect quite realised the case, he would at some period have had to say, “You cannot within the limit of expense that is prudent build anything either so ornamental and so roomy as you want; the design must be plain, some rooms given up, and the others kept small,” and so on. Whenever any such necessity arises, believe me, it is a mistake to shirk or postpone the unpleasant duty. Meet it squarely and fairly and with good temper.

In dealing with those employed on your works, it is a mistake to suppose that every contractor, tradesman, or artificer is a thief or an extortioner, and every quantity surveyor a kind of contraband agent. I have put it strongly, but the suspicious temper of mind at which this remark points goes sometimes far towards a tone of feeling as exaggerated as this. The fact is that your contractors and tradesmen are engaged in one of the most complicated and difficult businesses possible. Their motive for carrying on the business is to make a profit, and you should look upon it as a matter for sincere regret if a profit is not made by the contractors on your works. You and they are engaged together on the difficult task of erecting a building, and if originally you know them to be respectable, by all means treat these people as co-operating with you and aiding to give reality to your designs, which is their real position, and do not suspect unfair dealing till some proof of it begins to show itself. Such a course will be much nearer the fair and proper mode of administering a building. While I recommend this tone of mind I do not recommend that you should cease to be vigilant and careful. It would be quite as great a mistake to abandon watchfulness as to abandon confidence gratuitously, and it would be a departure from the line of conduct which your duty to your client prescribes to you. It is perhaps hardly necessary now to say anything about quantity surveyors, but I know that when I began practice, there was a kind of uneasy feeling in the minds of some of us, as though quantities were a kind of illicit trading, and those who prepared them akin to smugglers. If any of you share these notions now, permit me to assure you that they are a mistake, that the profession of a quantity surveyor is a most honourable and confidential one, and that the work they do is now indispensable to the conduct of building operations of any magnitude or complexity, and the assistance they render to the architect very valuable.

This mention of contractors and surveyors will serve to introduce another subject that should be noticed. It is for a beginner a mistake to employ second-rate or unknown men, either as builders, manufacturers, or quantity surveyors. When you have established your position and gained a reasonable amount of reputation and experience, do as you like, but in early days you cannot afford to employ people who are not first-rate. It is of vital importance to run no risk of failure in your early works, and the employment of thoroughly reliable persons will greatly diminish that risk, and their known position and trustworthiness are a great safeguard and help to you if any part of their work should go wrong; and to some extent the same caution is a prudent one as regards new materials and untried modes of construction. A fortunate accident on the very first matter of any importance ever put into my hands revealed to me the value of employing known men. The work

came from a man of business in the country, and I was I know looked upon with distrust by his London agent, who saw me for him, as young and untried. Fortunately, after making out some drawings and a specification, I got an estimate from a contractor of good repute, and I well remember how, when I went with the whole to my new client's agent, his face brightened up when he saw the signature of a man whom he knew well as competent and trustworthy, and by whom, ultimately, by-the-by, the work was excellently done. I urge this the more because young men often are more exposed to the temptation to get their work done in the very cheapest way than they will be in after life.

It appears to me to be as much a mistake for a practitioner of architecture to isolate himself as I earlier pointed out it is for a student. If there be no suitable associates within reach, it cannot be helped; but in nine cases out of ten there are brother professional men available. Just as you gentlemen, as students, can learn a great deal from one another, and will lose much of the stimulus and encouragement which make work go well if you do not in some way work in company, so in after life also you will derive great benefit and great pleasure from the society of those who are working at the same profession as yourselves, pursuing the same aims, encountering the same difficulties, delighting in the same studies; and you will be able to render assistance to your professional friends as well as to receive it from them. There are many circumstances under which two architects have to meet as representatives of two clients differently affected by some building operation. You can hardly imagine till you have had experience of it how much better all this class of business is got through if the two professional men know one another; or if even they only know each other as members of the Institute or of the Architectural Association, or in some such relation, than if they meet as absolute strangers. There are also many circumstances in which it is of inestimable importance to an architect to be favourably known to the members of his profession, and I strongly urge you all to begin in this classroom and the Association and Royal Academy schools to work together, and in after-life to belong to the Institute, and not only belong to these societies but give some attention and time to their work. An architectural hermit is a mistake.

It is not necessary, I hope, for me to offer proofs that most of the mistakes named deserve the name. I think your own good sense will have recognised, as we went through them, that they merit, each of them, a place in the list of things to be avoided. Some of these mistakes I have myself made, and have found to my cost that they are what I have described them to be. Others I have happily escaped, but I have seen them made, and know that their consequences are not good. There is only one more mistake that I shall allude to, and it is a lecturer's mistake. There is no greater mistake for a lecturer than to be tedious, and lest I should fall into that mistake, I propose now to bring this lecture to a close. It would have been possible to go on much longer, but what has been said must suffice; and yet it is impossible to end without one last word of encouragement, in which perhaps some of you may find a clue to keep you free from not a few mischances.

To steer clear of every error is impossible, but what I wish to say is that good sense, right feeling, and thoughtful attention to your work will go far to preserve you from any very serious slips. Years ago a pupil of mine acted as clerk of works on a job of mine where there was a great deal of masonry, and something which he told me about that masonry seems to convey a lesson. He noticed that some of the masons, as soon as they got a block of stone out of which to cut a feature of the building, set to with mallet and chisel, and in ten minutes were hard at it. Others would spend an hour or two or possibly a whole morning studying the block of stone on every side, considering exactly how best it could be utilised, and in short laying out their work before they put their hands to it. The men who made mistakes in their work were masons of the first group, not of the second. Perhaps this observation may suggest to us a method by which we may avoid mistakes in our work.

#### THE LATE MR. JAMES SELLARS.

IN a notice of the professional career of the late Mr. James Sellars the *Glasgow Herald* gives the following account:—

Mr. Sellars was born in Glasgow in the year 1843, and about thirty years ago he entered the office of Mr. Hugh Barclay to serve his apprenticeship as an architect. Subsequently he occupied the position of draughtsman with several of our local architects, ultimately entering the office of Mr. Campbell Douglas, with whom in course of a few years he became associated as partner, under the firm of Campbell Douglas & Sellars. The name of Mr. Sellars came first conspicuously before the public in connection with the Stewart memorial fountain. Soon after he joined Mr. Campbell Douglas, and before he was a member of the firm, competitive

designs were submitted by nearly all the Glasgow architects, and twice he was awarded the first place. The design was adopted by the committee, and in due course the fountain was erected in Kelvingrove Park, where it will remain as a memorial of the early age at which Mr. Sellars attained his power. In the course of his subsequent career he gave full evidence of the possession of all those qualities which go to make the successful architect. Quick to apprehend what was required by those by whom he was consulted, a draughtsman with few equals even in this age of good draughtsmanship, he had remarkable facility in placing his ideas on paper. In addition, he imbued all his work with his own individuality, and it is an open secret in the profession that every detail of every design which left his office was either drawn with his own hand or thoroughly revised by him before being put into execution. His judgment was almost unerring, and his clients never failed to find in him a sagacious and trustworthy adviser.

Mr. Sellars's power as an architect was seen to the greatest advantage in the various public buildings for which he supplied designs. Among these, probably the most important is the St. Andrew's Halls in this city. These designs were prepared before Mr. Sellars joined the firm of which he was subsequently the active partner, but his influence is very marked throughout the whole building. The new club in West George Street is another design in Mr. Sellars's best style. In the opinion of many well qualified to judge no building in Glasgow shows a more thorough mastery of detail; and this is the more remarkable when it is considered that at the time it was designed Mr. Sellars had not had the benefit of foreign travel, and that much of his professional education was self-acquired, the result of close application in comparatively adverse circumstances. The Belhaven United Presbyterian Church and the Hillhead Established Church rank among the most important of Mr. Sellars's Gothic buildings. They are excellent examples of different phases of this style of architecture, and with the buildings already mentioned—the one a Greek, the other a Renaissance design—illustrate the versatility of his genius. It is impossible to enumerate all the work which has been carried out under the direction of the firm of which Mr. Sellars was a partner. As showing how much he has had to do in recent years in giving character to the architecture of our city, the following may be mentioned, viz.:—The *Glasgow Herald* offices; the office of the Scottish Amicable Insurance Company, St. Vincent Place; the City of Glasgow Bank, Glassford Street (now occupied as a warehouse); Messrs. Wylie & Lochhead's warehouse in Buchanan Street; the Queen Insurance Office, St. George's Place; Finnieston, St. Enoch's, and Anderston Free Churches; the Kelvinside Academy; the Sick Children's Hospital and Sick Children's Dispensary; the Mossbank Industrial School; the Cooper Institute, Cathcart, and many others. In addition to all his other work, Mr. Sellars sent forward designs in all the competitions which have taken place in Glasgow during the past twenty years. His plans for the Municipal Buildings are well remembered, and many regarded them as among the best submitted. In everything having for its object the advancement of art and architecture Mr. Sellars took the warmest interest. For nine years he was a member of the Council of the Institute of Fine Arts, and he filled the presidential chair in the Glasgow Institute of Architects and the architectural section of the Philosophical Society, while he was honorary president of the Glasgow Architectural Association. A draughtsman of the first rank, he was thoroughly conversant with the practical details of his profession, and many of his addresses to these societies formed important contributions to the discussion of questions of sanitation and construction. Mr. Sellars was from its beginning a member of Belhaven U.P. Church, and at the time of his decease was preses of the congregation.

## TESSERÆ.

### Subjects for Decoration.

A. POYNTER.

IN the resources which the decorative artist can call to his aid, the moderns have greatly the advantage over the ancients, since we possess their materials and our own also. For as long as ancient authors are read and ancient art appreciated, so long will allusion to the manners, customs, poetry, and religion of antiquity be familiar to us, and the symbols to which they gave rise be universally understood; indeed numberless allusions of this kind are constantly before us, and are so familiar that we forget to inquire their origin. In personification, and the embodying of abstract ideas, the field is as open to us as to them, and we see to what advantage it may be turned by the examples we have just passed in review; and if we add to all these objects those derived from

the useful arts and sciences which may be turned to account in the hands of the skilful decorator, his resources may be considered boundless. For, as we have seen in these examples, it is not the familiar aspect of any object which should banish its representation from works of fancy. Everything depends upon its proper application. The ancients made the best use of whatever they considered most appropriate, and we must endeavour to do the same.

### National Taste.

R. REDGRAVE.

Taste, which is in accordance with the habits, inclinations, and general disposition of any people, may be national without being correct. It is with nations as with individuals, of whom we hear it said that one has a vulgar taste, another a refined taste, one a mean taste, another a taste for the beautiful or the magnificent. Thus in referring to the ancients, all who have had any knowledge of ancient art or literature would at once say that the Greeks as a people had a taste for the refined and the beautiful; in literature, always entering into the most subtle definitions and the nicest distinctions; and in art refining all they undertook with the most sensitive perception of what is perfect, never leaving a new creation until they had by continual effort arrived at the most beautiful form, proportion, and colour of which it was capable. The Romans, who succeeded to their art, were of a different character: grandeur and massiveness were the leading characteristics of their taste. Larger in mind than the Greeks, there was at the same time a coarse strength in their nature, and a barbaric grandeur, to which Greek art never attained, was the corresponding result. This was shown in the vast extent of their public buildings (such as the Baths of Titus and the Coliseum, compared with which the largest works of the Greeks would appear diminutive), in the coarse vigour and bold relief of their ornamentation, and the spherical curves of their mouldings.

### Amateur Artists.

W. JACKSON.

To attain excellence in the arts is the lot of very few professors, who have spent their lives in the pursuit. Gainsborough, after a close application to painting for fifty years, said on his death-bed, "I am but just beginning to do something, and my life is gone!" I could repeat expressions of architects, sculptors, and musicians, grown old in the study of their professions, to the same purpose, from whence we may conclude that the usual term of the duration of our faculties is not sufficient to attain that perfection to which genius aspires. This truth being admitted, for it cannot be denied, what shall we say to those peremptory judgments which are passed upon the works of genius by persons who never had, nor, perhaps, could have, a thought upon the subject? In any other case we should judge them rash and presumptuous. No man who is unacquainted with the common professions and trades ever pretends to know anything about them, but every man fancies he can be an architect, painter, or musician with simply saying, like the Elector of Brandenburg, "I will be a king!" Every one feels himself equal to the designing and building a house—very few who do not think they might, if they chose it, be painters—and what numbers of *dilettanti* are there who, because they possess ear, and perhaps a taste for music, fancy they can compose? Should these *soi-disant* artists exhibit proofs of their skill, it is natural to imagine that their impotent attempts would only be despised and make them ridiculous; just the reverse, their works are most favourably received. What they may possibly want in skill, say the public, they possess in taste, and a natural taste is everything.

### Ancient Sanitation.

G. WILSON.

Towns must have fearfully suffered before the inhabitants learnt that the houses must be so far separate as to allow air to blow between them. The Greeks must certainly have made their cities, and many of their streets, exceedingly handsome, but their earlier towns, and even Athens, were too much crowded; and so much did they fear jobbery among the sharp-eyed business men of the city, that they dared not trust anyone with money to rebuild the place. In Constantinople, Zeno ordered all houses to be 12 feet apart all the way up, and the projections which caused the houses nearly to meet above were disallowed. This was an effort, after a long interval of neglect. He attempted also to go farther, and ordered that no one should stop the view of the sea from his neighbour. This would be well in our sea-bathing towns, where houses are built before others without pity, and not only is the view destroyed, but the whole living of the families who possess it, and to whom the view paid the rent. But the laws are of no value unless a strong and vigilant executive attends to them. Constantinople became so bad that its destruction by fire was

scarcely deemed a misfortune. How infected by their own crowding the Romans must have been when the houses were ordered to be at least 5 feet apart, and not more than nine storeys high. Augustus said they should not exceed 70 feet in height, and Trajan made the limit 60. The laborious proofs that sewer air is unwholesome have taken commissions and boards of health many years of hard labour in our time, but the whole is as clearly recognised in Justinian's Digest, in quotations from Ulpian, that it is evident that the question was then past all dispute. The world is obliged occasionally to revive its principles. However true may be the opinion that man is always in progress, we cannot deny that he often makes, in certain places, wonderfully long steps backwards. Although Hippocrates is praised for his skill, shown in fumigating the streets by the smoke of fires and by perfumes, by shutting certain windows and opening others, one of our prominent men in the sixteenth century is found speaking with approval of killing "pigeons, cats, dogs, and other hot animals, which make continually a great transpiration or evaporation of spirits which issue forth of evaporation, the pestiferous atoms which are scattered in the air, and accompany it, used to stick to the feathers, skin, or fures." We, as a nation, have gone backwards and forwards as the ancients did, and in a generation we have many waves of opinion, because we do not learn sound principles, or if we learn, we do not teach them that they may be continued.

#### Pompeian Houses.

E. M. BARRY.

The walls of the dwellings are as a rule badly built, with ill-burnt bricks and rubble, and owe much of their stability to the plaster with which they are encased, and which is of good quality. Some of the surfaces, indeed, are so hard and fine that they bear a polish like scagliola, or our hardest cements. In such cases great care has been taken with the last or finishing coat, formed of sand, lime, and pounded marble. This was well rubbed down, and Vitruvius says the colours were laid on while it was wet, so that they became a part of the structure like the more modern fresco, which was incorporated with the plaster, instead of being a mere surface application like ordinary painting. The Roman floors were often very beautiful, as you may see from the specimens preserved in the museums of Europe, and particularly in the Louvre at Paris. They were made of cement, in which fragments of marble were set constituting mosaics. These existed in Pompeii in great variety, and some of the panels were very finely designed and executed. We have lately witnessed amongst ourselves a revival of this mode of constructing floors, the chief credit of which belongs, I believe, to the authorities at South Kensington. The doors of the Pompeian houses were of wood. They were consequently destroyed, but their form and character can be distinctly traced. They had no hinges, but revolved on pivots, and must have made much noise when they were opened or shut. The creaking of a door was not objected to, however, as it was considered a proper mode of announcing the approach of a visitor, and thus served the same purpose as the modern bell. Iron chains and bolts were used at night for securing the doors. It is known that there was glass in Pompeii, not only for domestic utensils, but also for use in windows. It was, however, rarely used, in consequence probably of its great cost. Some of the rooms in the public baths had glazed windows, and the glass was found in fragments when the building was first excavated. It is of good quality, and ground on one side to prevent persons outside from looking into the baths. In the museum at Naples there are great quantities of glass bottles and other vessels of the same material, all of which were found at Pompeii, and we may feel confident that so clever a people as the Romans were could not have employed glass for such purposes without perceiving its advantages for windows, when they wished to admit light while excluding the external air. Indeed, during the later times of the Roman Empire, there is reason to believe that the walls of the great public baths were lined with glass as well as marble, and even decorated with mirrors. In connection with this subject, it may be here stated that in addition to glass vessels, almost every conceivable household utensil has been found at Pompeii, and among them portable fireplaces, braziers, and contrivances for heating water. In the houses generally there are no fireplaces or other permanent arrangements for warming, and it is difficult for us to understand how the people can have lived in health or comfort in these slight dwellings, with their courts uncovered and exposed to the vicissitudes of the climate, although the climate of the South of Italy. The latter is, of course, very different from our own; but in winter time the modern Neapolitan is glad to welcome the comforts of fire and warmth, which in northern countries are more constant necessities. Moreover, the climate is far from unvarying; there is sometimes a great amount of cold, and I have myself seen a fog at Naples which would have stood comparison with one on the banks of the Thames.

#### Data for Strength of Stone.

G. R. BURNELL.

We do not possess any tables of the resistance of English building stones to crushing weights which can be considered to be perfectly satisfactory. All the experiments recorded, excepting the few mentioned in Mr. E. Clark's account of the Menai Tubular Bridge, have been made upon small cubes of at most 3 inches on the side. In practice, however, the resistances are singularly modified by the joints, and the interposition of mortar between the bearing surfaces; whilst Vicat's experiments upon small superposed cubes seem to indicate that the number of such horizontal joints considerably modifies the resistance of each of the cubes. Again, the results usually quoted of late years of the resistances of building materials have been obtained by the use of the hydraulic press, an instrument which is very likely to get out of order, and whose indications cannot easily be watched with the accuracy required in investigations of this delicate nature. Mr. Hodgkinson, in his experiments on iron, wood, and some kinds of stone, and M. Flachet in his observations upon the resistances of the Aubigny, Orival, Caen, and Ranville oolites, used a system of levers in the applications of the weights to those materials; and though unquestionably there is a probability of the weights being in such cases made to bear unequally upon the exposed surfaces, the danger is not greater than when the hydraulic press is used, while, on the other hand, it is far easier to apply the load by slight increments, and to watch its action during even a lengthened period. After all, the most valuable observations upon the resistance of building materials are those to be obtained from observation of the conditions of success and failure of actual constructions, such as Rondelet records in his "Traité de l'Art de Bâtir."

#### Thorwaldsen's "Mercury."

J. C. HARE.

An illustrious friend of mine calling on Thorwaldsen, found him, as he said to me, in a glow—almost in a trance of creative energy. On his inquiring what had happened, "My friend, my dear friend," said the sculptor, "I have an idea, I have a work in my head, which will be worthy to live. A lad had been sitting to me some time as a model yesterday when I bade him rest a while. In so doing, he threw himself into an attitude which struck me very much. 'What a beautiful statue it would make!' I said to myself. 'But what would it do for? It would do exactly for Mercury drawing his sword, just after he has placed Argus to sleep.' I immediately began modelling. I worked all the evening till, at my usual hour, I went to bed. But my idea would not let me rest. I was forced to get up again. I struck a light, and worked at my model for three or four hours; after which I again went to bed. But again I could not rest: again I was forced to get up, and have been working ever since. Oh, my friend, if I can but execute my idea, it will be a glorious statue!" And a noble statue it is, although Thorwaldsen himself did not think that the execution came up to the idea. For I have heard of a remarkable speech of his made, some years after, to another friend, who found him one day in low spirits. Being asked whether anything had distressed him, he answered, "My genius is decaying." "What do you mean?" said the visitor. "Why, here is my statue of *Christ*: it is the only one of my works that I have ever felt satisfied with. Till now my idea has always been far beyond what I could execute. But it is no longer so. I shall never have a great idea again." The same, I believe, must have been the case with all men of true genius. While they who have nothing but talents may often be astonished at the effects they produce by putting things together which fit more aptly than they expected, a man of genius, who has had an idea of a whole in his mind, will feel that no outward mode of expressing that idea, whether by form or colours or words, is adequate to represent it. Thorwaldsen's *Mercury*, it appears, was suggested by a lad whom he had seen sitting at rest. But does that detract from the sculptor's genius? Every other man living might have seen the lad, and no statue of Mercury would have sprung out of the vision; even as millions upon millions before Newton had seen apples drop, without being led thereby to meditate on universal gravitation. So that, though genius does not wholly create its works out of nothing, its "mighty world" is not merely what it perceives, but what, as Wordsworth expresses it in his lines on the Wye, "it half creates."

Great Efforts are being made for repairing Seville Cathedral, the neglect of which recently resulted in serious damage. Monthly donations of 20*l.* each are being made by the Ayuntamiento, the Diputación, and the Cathedral Chapter, and the total subscriptions up to the middle of last month had amounted to 285,609 pesetas, or about 11,425*l.*

## ILLUSTRATIONS.

PROVIDENT DISPENSARY, BEDFORD.

THIS building was opened by the Marquess of TAVISTOCK on December 13, 1887, a short account of which appeared in our columns at the time.

The walls are faced with Lum's Hill stone (Derbyshire, Beck's Quarries), rock faced in random courses, with dressings of Monk's Park Bath stone, with cornices, labels, and copings in Ketton, the roof being covered with Broseley tiles.

The waiting-hall is 35 feet by 29 feet, the joiner's work being in pitch pine; floor solid wood block, by DUFFY & Co.; heating and ventilating by one of Messrs. MUGRAVE'S stoves. Communicating with the hall is the dispensary, consulting-rooms, and lavatory, and over this the dwelling-house for the dispenser.

The contractor was Mr. J. P. WHITE, of Bedford, and the designs and plans were by Messrs. USHER & ANTHONY, architects, Bedford.

FIRE STATION, BEDFORD.

THIS building, now in course of erection, was very much needed by the Volunteer Fire Brigade, in order to give proper accommodation for the valuable gift of a MERRYWEATHER steam fire-engine, presented by His Grace the Duke of BEDFORD to the Fire Brigade.

The external walls are constructed with Lum's Hill stone (T. BECK'S quarries, Matlock Bridge), the copings being of Ketton stone, and the roof covered with Broseley tiles. On ground floor is the engine-room, 22 feet 9 inches by 35 feet, with DUFFY'S solid wood-block floor, and in the rear is a covered-in yard for washing and cleaning engine in. On the first floor there is a large committee-room, together with lavatory and storeroom; and the second floor contains living-room, kitchen, and bedrooms for a resident fireman.

The station will be in telephonic communication with the principal buildings in the town.

The foundation-stones were laid on July 11 last by the Marquis of TAVISTOCK and Mr. S. WHITBREAD, M.P.

The contractor is Mr. GEORGE HARRISON, of Bedford, and the works are being carried out in accordance with the plans prepared by Messrs. USHER & ANTHONY, Architects, Bedford.

NEW DISTRICT CHURCH OF ST. PAUL, LUTON, BEDS.

THIS church, the plans for which have been prepared by Mr. THOMAS N. LASLETT, architect, of Walbrook House, E.C., having been for some years in contemplation, is now about to be commenced, the estimated cost, including the tower and spire, being 6,400*l.* It is much needed to meet the requirements of the growing district of New Town, Luton. The principal dimensions are as follow, viz., nave, 97 feet by 29 feet in the clear; chancel, 40 feet by 29 feet; aisles, each, 60 feet by 12 feet; transepts, each, 26 feet by 20 feet; chancel aisle, 20 feet by 12 feet; extreme length outside, 164 feet; ditto breadth, 87 feet. Owing to the position of the site the chancel will be to the south-west, next Arthur Street, and the tower and vestibules to the north-east, next Hibbert Street, where the principal entrances will be from a raised terrace. Separate vestries are provided for clergy and choir. The church (without galleries) is calculated to seat 900, besides 32 in the choir.

KIRBY HALL.

THE FLÛCHE AT ST. JOHN'S CHURCH, HEBBURN-UPON-TYNE.

IT will be remembered, from the description of this church given in our issue of June 22, that it has been converted out of a receding wing of Hebburn Hall, 148 feet long and 28 feet wide, which was generously presented by Mr. J. R. CARR-ELLISON, J.P., of Hedgeley and Dunston Hill, and designed by Mr. F. R. WILSON, diocesan surveyor, Alnwick.

The timber of the roof is of old red wood, in splendid condition, and the two couples supporting the flèche are constructed to utilise the previous king-post trusses. The centres of the tie-beams have been cut out, to admit the arched ribs forming a wide chancel arch, and raised and doubled to form collar-beams, and the principal rafters have

been strengthened with additional backs placed upon the tops. The tall octagonal flèche has been erected in stages, and securely strapped and bolted, and boarded to receive the 12-inch by 6-inch Welsh slates, mitred, and set in mastic, at the angles. A lead roof has been placed below the louvres to carry off drifting rains. The walls of the church are strengthened with massive buttresses at the sides to counteract thrusts. No part of the construction of the flèche is seen inside the church, as it is concealed above the wide chancel arch. The original roof was covered with sound Westmoreland slates, hung on laths with oak pegs. This was stripped and a false collar-beam roof raised about 7 feet above it, with a half pitch, to give more ecclesiastical effect to the building, and the same slates, nailed in the centre, with copper nails, placed on laths upon it. After the slates had been pointed, the under side of the spars of the outer roof were lathed and plastered with one rough coat, and the lower roof was boarded to form the ceiling of the church. A small model, for reference by the workmen, was made by Messrs. T. ROBERTSON & SONS, Alnwick. The sole contractor was Mr. JOHN MUNRO, Hebburn-upon-Tyne, and Mr. M. TEMPLE WILSON acted as resident architect.

## THE ARCHITECTURAL ASSOCIATION.

THE annual conversazione of this Association, held on Friday evening last at the Westminster Town Hall, drew a large attendance of members, accompanied by ladies. The president, Mr. H. D. Appleton, F.R.I.B.A., received the visitors in the large hall, where the band of the Royal Scots Guards, under the conductorship of Mr. Holland, during the evening gave selections from the musical programme arranged for the occasion. Musical entertainments were also given under the direction of Mr. J. Elwin, assisted by Madame Isabel George, Mr. Charles Chille, and Mr. Herbert Schartau, the instrumental department being sustained by Herr Polonaski on the violin, and by Miss Kate Cheyne and Mr. Herbert Schartau on the pianoforte. Between the parts the President announced the names of the members who had succeeded in carrying off prizes and honours.

The prize-list is as follows:—

- Architectural Association Travelling Studentship*, Mr. D. J. Blow; 2nd prize, Mr. R. D. Warry.  
*Aldwinckle Travelling Studentship*, Mr. H. V. Lanchester.  
*Architectural Association Medal and 10*l.* 10*s.**, Mr. B. F. Fletcher; hon. mention, Mr. E. L. Lutyens.  
*Essay Silver Medal and 10*l.* 10*s.**, Mr. H. Tooley; bronze medal and 5*l.* 5*s.*, Mr. W. Wonnacott; hon. mention, Mr. A. A. Cox.  
*Architectural Union Company's Prize*, Mr. S. Tugwell.  
*Cates Prize*, Mr. A. W. Hennings.  
*Ernest Turner Prize*, Mr. A. W. Jarvis.  
*Elementary Class of Design*.—Section I.: 1st prize, Mr. A. E. Habershon; 2nd, Mr. P. G. Eade; hon. mention, Mr. A. H. Saul and Mr. C. H. Strange. Section II.: 1st, Mr. A. W. Jarvis; 2nd, Mr. C. Bywater; hon. mention, Mr. R. A. J. Bidwell.  
*Elementary Class of Construction*: 1st, Mr. A. W. Cleaver; 2nd, Mr. F. H. Greenaway.  
*Elementary Class of Ornament and Colour Decoration*: 1st, Mr. C. S. Haywood; 2nd, Mr. V. T. Jones. Class prize, Mr. V. T. Jones.  
*Class of Design*: 1st, Mr. D. J. Blow; 2nd, Mr. C. O. King; hon. mention, Mr. J. E. Jefferson.  
*Class of Ornament and Colour Decoration*: 1st, Mr. H. V. Lanchester; hon. mention, Mr. C. J. L. C. de Beaupré. Time Sketch, Mr. C. J. L. C. de Beaupré.  
*Class of Construction*: 1st, Mr. O. Oertel; 2nd, Mr. H. Ernrick.  
*Advanced Class of Construction*: Mr. O. Fleming.  
*Quantity Class*: 1st prize, Mr. A. O. Breeds and Mr. G. Harvey equal.  
*Sketch-Book Prize* (title-page), Mr. W. G. B. Lewis.  
*Neale Prize*, Mr. S. Greenslade; hon. mention, Mr. H. Tooley and Mr. A. C. Walker.  
*Edis Prize*, Mr. A. Gladding.

*Lectures on History*: 1st prize, Mr. F. Elgood and Mr. O. Fleming equal; 3rd prize, Mr. E. Carless; hon. mention, Mr. W. Pywell and Mr. J. Gethin.

*Lectures on Construction*: 1st, Mr. F. R. Taylor; 2nd, Mr. A. C. Walker; 3rd, Mr. H. E. Mathews; hon. mention, Mr. E. Carless and Mr. L. J. Veit.

The prize drawings were exhibited in the rooms on the first floor of the building. There were also exhibited pencil and water-colour drawings by various members, including drawings by Messrs. Aston Webb, H. O. Cresswell, Walter Millard, Gerald Horsley, A. B. Mitchell, E. H. Selley, R. Phené Spiers, C. E. Mallows, A. H. Hart, and W. M. Duke.

The rooms were tastefully arranged and well lighted, the bright effect being heightened by the array of flowers. In the large hall were numerous exhibits of high-class objects from various firms. Messrs. Morris & Co., of London and Merton Abbey, were represented by wall-papers, hangings, and tapestries. Messrs. Jeffrey & Co., of Essex Street, Islington, by non-arsenical artistic wall-papers, among them being new decorations, including design by Mr. Lewis F. Day, with frieze 30 inches in depth, in which are introduced medallions representing the emblematic subjects of Earth, Air, Fire, and Water. The "Grotesque" design, in crimson and gold embossed leather paper, by the same artist. Panels of Persian ornament (a design by Mr. A. F. Brophy), suggested by the decoration in the palace of Taj Mahal; also the "Woodpecker" design, by Mr. Sydney G. Mawson; and a "Free Classic" decoration, by Mr. Hampden W. Pratt. Messrs. G. R. de Wilde & Co., late Newman & Co., by metalwork and ironwork. Messrs. Campbell, Smith & Co., of Newman Street, by schemes of decoration, &c., with a plan of the proposed decoration for the staircase at the Villa Selvosa at Cannes, for Mr. A. Ussher. Messrs. E. P. Turner & Son, Charlotte Street, Fitzroy Square, by art tile-paintings and designs. Messrs. Holland & Sons, Mount Street, W., by a massive cabinet of ornamental character of inlaid woods. Messrs. William de Morgan & Co., Great Marlborough Street, by ornamental tilework. Messrs. Carter & Aynsley, Bishopsgate Street Without, by staircase-work, balusters, &c., door furniture in wood and metal. Mr. H. C. Liley, Radnor Place, Hyde Park, by illustrations of ceiling decorations and decorations for dining-rooms, ball-rooms, &c. The Coalbrookdale Company by metalwork, worked fireplaces and furniture, also by statuettes and groups, figure and animal forms, &c. Messrs. George Wright & Co., Queen Victoria Street, by mantelpieces and overmantels of wood and of iron, and mirrors. Messrs. C. Hindley & Sons, Oxford Street, general fittings, carpets, rugs, &c., mantels, overmantels, and an exquisite ingle nook. Messrs. W. Walker & Son, Bunhill Row, by a massive carved wood chimney-piece and overmantel in Renaissance style, and handsome wood sideboard. Messrs. Longden & Co., Oxford Street, by grates, fenders, &c., fire-irons and furniture after old styles, mantelpieces and the like. Messrs. Montagu J. Scott & Co., by electric light and fittings; and last, but not least, Messrs. William Woollams & Co., by specimens of their well-known artistic and non-arsenical wall-papers and decorations.

#### THE MONUMENT.

AT the meeting of the Court of Common Council last week, Mr. H. H. Bridgman asked the chairman of the City Lands Committee whether he could give any information which would tend to reassure the public mind as to the safety of the Monument, and whether the cause of the recent fall of part of the stonework was in any way due to the construction of a subway within 50 yards of the base of the structure.

Mr. Frank Green said that every possible step had been taken to insure the safety not only of the Monument but— which was of greater importance—of the public. As soon as he heard of the accident he took upon himself the duty of giving instructions to close the Monument to the public during the period necessary for repairs, and also that steps should be taken at once to protect the public from accident by any further fall of masonry. He thought it very desirable that while they were about it they should avail themselves of the opportunity of thoroughly inspecting the stonework of the structure. Orders had been given to enable this to be done and to repair any portion of the stonework necessary. He thought the Court and the public should be assured that a most thorough investigation was being made into the cause of the accident, and that every effort would be made to obviate further danger. As to the accident being due to the construction of the neighbouring subway, that suggestion would be carefully looked into and measurements made. At present it was impossible for him to say whether the construction of the subway had anything to do with the accident, but he should think not.

Mr. Francis Chambers writes to the *Times* to correct statements which are contrary to his experience of the use of stone in London.

I have, he writes, in the course of years had, as architect, to superintend the repair of three of Wren's steeples, viz., Bow Church, St. Mary Aldermay, and St. James, Garlickhythe. In each case the stone is Portland, and the injuries to the stone were not due to atmospheric influence but to the use of wrought-iron cramps and dowels instead of copper or bronze. Several of the columns of the spire of Bow Church had to be taken out and reinstated, and in the case of St. Mary Aldermay, two of the pinnacles had to be rebuilt. The effect of oxidation gradually thickens the iron cramp—so much that some of the cramps taken out of St. Mary Aldermay had increased from  $\frac{3}{8}$ ths of an inch to  $\frac{3}{4}$  of an inch. The force exerted on the stone acts as a wedge and is irresistible; sooner or later the stone is fractured. I have not inspected the Monument, but it is probable the accident there arose from a similar cause. I believe Portland stone to be the best building stone for use in London; it is less affected by the atmosphere than any other. Where exposed, in south-west aspect, to driving rain it is dissolved or worn down very gradually and evenly, but it very rarely decays and crumbles away as do the Bath and Caen stones. In repairing the tower of Aldermay I noticed that a painter had in 1790 painted his name and the date on an exposed stone face with the thick red residuum of his paint pot. This paint surface had resisted the action of the drift rain, and when I saw it some twenty-five years ago, the surface of the letters was  $\frac{1}{8}$ th of an inch in advance of the stone like an engraved wood-block, thus giving a fairly accurate time measurement of the wearing away of Portland stone.

#### PROFESSOR HERKOMER ON PORTRAIT PAINTING.

ON Thursday evening last week Professor Herkomer delivered an address on art in the Philosophical Hall at Leeds.

The subject of art, he said, was much too large to deal with in one night, but he would take one phase of art which he thought would interest them most. It was a phase he had had some experience of, and he would tell them the truth about it. They were apt to blame the public for not knowing enough about art, and yet there were few who attempted to tell them anything about it. Artists were supposed to keep things to themselves. They really did not keep them to themselves, only they were sometimes very awkward in explaining in language what they would instinctively express with their brush. He would endeavour to take portrait painting as his subject. He considered portrait painting to be an art that was mostly looked at, mostly sought for in galleries, and yet least understood. People were satisfied if they recognised the person represented. That was all. It was a good likeness; you went no further; you cared no more, perhaps, for the future generations that were to buy portraits as the greatest works of art. Look where you would, you would find in the old masters their best qualities embodied in portraiture. You did not care very much for the man represented. He fortunately died; while time made the art, or the representation of the man, the thing to be remembered, so that portrait painting became historical painting in its truest and best sense. Painters in the present day were, of course, troubled with many things in regard to portraits. They were troubled with costumes. The more civilised we became the less picturesque we became. In the first place, this great art for immortalising us, as some one had wisely described it, could be divided into the artistic and into the mere likeness painting. In a portrait, of course, you should have the likeness of the person represented; but you wanted more than that. You must get into that one portrait, if possible, the most characteristic phases of that man's mind. This was a difficult and sometimes an impossible thing to do on one canvas; and as painters were not often permitted to paint two or three portraits of the same person—certainly not for payment—they could not always represent all they wanted in one picture. The likeness was only like the man if they got the mind.

Photography was curiously amiss there, but, still, had played so great a part in the modern phase of portraiture, that the work of painters was becoming doubly difficult. People might be sure that many of the portraits of Reynolds and Gainsborough had not always been striking likenesses. Indeed, he could not believe that all the eyes—the Chinese eyes—and the dainty, little red lips that Gainsborough invariably gave his women were true, and he could not believe either that all the portraits of Reynolds were correct likenesses. But every now and then there came an effort which showed everything that could be given. Photography had obliged modern artists to make as admirable a likeness as they possibly could; and, in addition, they were expected by judges—he did not say by the public—to give a great work of art. Consequently, they worked with two distinct motives. They worked for the public that wanted the portrait as a likeness, and they worked for the

future. In that way they were troubled perpetually, and no one there knew perhaps what agonies—real, heartfelt, bitter agonies—a portrait painter—aye, and the most successful portrait painter—went through in his yearly work, and when his pictures were finished he was fagged out in a way that no other painter could possibly be fagged out. He came to that condition when he cherished a hatred for art, for mankind, for anything that appertained to his profession; and, when his appetite for work returned, he found that he had been accumulating qualities that were entirely wrong, and probably that his first sitter was by no means made by nature as a receptacle for his own ideas. Again he found himself falling into his little rut, his painful mannerisms that had to be hauled out of his inner wickedness in order to get the work out of hand. Therein lay the kernel of disorder in the painter's life. He was struggling all the while to be honest. When he failed the public did not fail to blame him, although they little knew how and why the failure had come about. When success came to him, however, the joy was greater perhaps in the case of a portrait than of a subject, because the painter touched a human chord with his sitter that was never to be broken in after life. There were other moments when the work was nearly right and yet not quite right, and the artist did not know why it was not quite right. He was now speaking of successful portrait painters. When the painter found himself face to face with that difficulty, he, in his anxiety to keep prestige—poor souls, they were very anxious to keep prestige—defended what he knew was not right.

The public was easily scared. It was not on that ground that portrait painters sometimes started a portrait two, three, and four times, and then threw it away. The first difficulty was this—How much was to be a picture, and how much a mere portrait? The difference between subject painting and portrait painting was great. In a subject picture you never took nature as you found it, but rather endeavoured to mould nature to your own idea. But in portrait painting you had to sink your own identity as much as possible, and get at the identity of the sitter. It was not unmanly, possibly, of an artist to get sitters who always accorded with his own ideas, and there the commercial difficulty came in. If the portrait painter had a certain price for his work, then he had a certain set of people. If he raised the price until only a few could come, then he only got those who had money, and not necessarily those who had character. It was not always possible to be in sympathy with a sitter, and yet they would be surprised to find how much similarity there was between different temperaments once they got under the crust, as it were, of the habit of behaviour. In order to do this it was absolutely necessary for a portrait painter to be free from political or any other bias, and to be broad in his views on all subjects. Whatever character lay in a man, certain it was that that character was shown on his face to those who could read it. Nevertheless, they never could paint successfully the young man if he had done nothing. Beautiful women, too, they did not want to be anything else but beautiful on canvas, but a man must have done something, must have lived a strong life—then he was interesting. He did not think a painter could successfully paint a man he had no sympathy with, or a woman he could not admire. He had no business to paint the portraits of such individuals: if he attempted it he was no longer an honest painter.

In England especially there was great difficulty in getting to understand a man; indeed, there was no other way of getting into close contact with a sitter than that of dining with him two or three times. A man was really only like himself when he was animated. Sacred were, he knew, painters who said that there should be absolute repose in a sitter before he could be painted, and he knew an artist who depicted one of the greatest scholars of the age with a Bradshaw in his hand. In that way he obtained the dullest and the most painful expression possible. It was a clever dodge, but it was not just.

Rapidity of work was one very curious item in portrait painting. To be swift, meant to shirk a certain amount of finish which Reynolds and Gainsborough never dreamed of putting into pictures, although time had done it for them. They could not now get time to do for them what it had for the works of those masters. Time was the greatest artist, and could they only wait five years before they exhibited any work there would be better pictures in the exhibition, because one-half could not be exhibited, and the other half would have become more mellow. They could not make new paint look anything but new paint except by putting glass over it, which contributed something of the effect of old work. But glass could not be allowed in the Academy. Slowness as well as rapidity in working had its dangers. There were some portrait painters who had fifty sittings of two hours each, and to do that meant the wearying out of the sitter. To have five sittings, on the other hand, might for some painters be too few, and yet they would be surprised to hear that Millais's three *Gladstones*—the finest things he had done—were all painted in sittings of five hours apiece. Mr. Gladstone told

him that himself. This was a marvel to him, because the paintings contained not detail, but the suggestion of detail, which which was the greatest art of all.

There was one man whose loss they had now to deplore, and who was rapid in the right degree in his work; and in speaking on that subject he would like to pay a loving tribute to the memory of Frank Holl. To him England owed much of its stability in portraiture. He was always strong, manly, and artistic. He gave up his favourite subject in painting to paint human creatures with a skill and regularity of completeness for year after year which amazed them all. In that way he brought them all to shame every now and then. The most modest of men, he shrank from making comparisons about himself and his work, or from saying an unkind word to brother painters who were only anxious to get his criticism, however severe. There was no one to take the place and position in English portraiture which he gave up. Now it was scattered. Some of them would do work and do it willingly, but would be waiting for the strong man to come again and hold them together.

One other important question was the quality of work. He did not know whether the old masters were so troubled with what we call quality in painting. Just as all craftsmanship, all working in wood or iron was naturally artistic in those days, so their art was. On the other hand, there were a certain number of pot-boilers among the old masters. Quality had been introduced because of the miserable commercial question which had crept into art. Another great destroyer of art was fashion. It had done as much harm as anything else, and he did not think any of them were inclined to forgive Vandyke for painting, in accordance with fashion, those artificial hands which were seen in every one of his portraits. There were other portrait painters like Velasquez who painted perfectly honestly everything they saw, and nowadays he believed there was no fashion in portraiture. Art wandered from one phase to another in quick succession, so that the public was quite puzzled as to what it was and was not to like. He warned them against detailed backgrounds in portraiture and against subject pictures, and in conclusion stated that he could put his hand on ten young painters now who could not get on because they were not known. The public might get for 50% from those young men work for which they would have to pay another man 500%. That should be known. His observations that evening would, he hoped, lead them to take a greater interest in portraiture, because he thought a great portrait of a great and good man or a beautiful woman was the best gift a painter could give to mankind.

#### STOCKPORT SCHOOL OF ART.

THE opening of the Stockport School of Art took place on Thursday last week, Mr. Alfred Darbyshire presiding. In opening the proceedings, he said he had heard with regret that there was an impression in the minds of some people in Stockport and the neighbourhood that the institution which they were about to inaugurate might stand in rivalry with another munificent and magnificent institution which had just been erected in Stockport—he alluded to the Technical School. He might at once tell them that such a state of things could not possibly arise as a rivalry between the Art School at Stockport and the grand institution which they would hereafter know as the Technical School. The Technical School would send out its scientists, its mechanics, and possibly and probably its artists, but that Art School was intended to occupy a very much smaller field of action. While doing so it aimed at the highest objects of art. It hoped to send forth into the world painters and sculptors, and possibly architects. He ventured to predict that future generations of the burghers of Stockport would render their thanks to the munificent and noble men who had started the Technical School, and he thought also that in a future time they would look back with pleasure to that evening as inaugurating a period in that town which sent forth into the world painters and sculptors. Pointing to the two great art epochs—the Greek period and the period of the Renaissance—he showed that those great periods of art were entirely owing to one grand thing—an absolute mastery of the human figure. A man or woman who could draw the human figure perfectly could do anything in art, and if students did not master the human figure they would regret it all their lives. In that school they would be taught by clever men who do their best to enable them to do certain things, but they must never forget that the keystone of the arch was the two magic words “truth and beauty.”

Mr. J. H. E. Partington, speaking on the subject of “Art Education, Ancient and Modern,” remarked that the advance of public interest in England in matters pertaining to the higher education of the people had of late years manifested itself in an unmistakable fashion. In no previous period of English history had there been such a marked and imperative

demand for a wider, a sounder, a more thorough culture of all classes of the community in science, in art, and in letters. Mechanics' institutions, South Kensington departments, art galleries, free libraries, technical schools are springing up on every hand; vigorous efforts were being made by all sorts and conditions of men to spread the influence of these establishments broadcast over the land; and older institutions, limping along on worm-eaten crutches, fashioned for them, it might be, hundreds of years ago, had the alternative sharply thrust upon them either to fall into step with the irresistible march of public progress or to be shouldered to the wall out of the way of the onward rush. We were rushing onward, but whither? Were we quite certain that the track we were pursuing with the indomitable energy characteristic of the race would bring us to the goal we had set our hearts on attaining? With impatient discontent—a discontent which had its origin in the noblest impulses of our nature—we were saying, "Our fathers have misled us. The pale and ineffectual fires with which they lighted their dim and doubtful way towards power and happiness, towards the victory of man over nature, towards art, science, literature, and political wisdom, have gone out for ever in the full burst of sunlight which since their days has risen upon the world. No longer will we walk in leading strings. We must break their bands asunder and cast away their cords from us. The old order changeth and giveth place to the new." He had a great deal of sympathy with that way of looking at things. But he was inclined to doubt whether in all matters of human activity the methods and performance of our fathers were of such an inferior and inadequate character in comparison with modern efforts and systems as our enthusiastic progressists would have us believe. He particularly wanted to know whether in the great department of art education we had so completely demonstrated the fallacy and futility of the old methods of teaching that we were justified in replacing them by a system centralised under the authority of a Government department. Certain awkward facts, which were quite indisputable, met the believers in their modern superiority at the very commencement of the inquiry. In the six hundred years before Christ there was a splendid development of the sculptor's art which had since had no parallel. The statues which were produced during this period have been at once the admiration and the despair of all succeeding schools, and it is quite certain that no sculpture of the nineteenth century could compare with them for a moment. Most of the casts which they have selected for the School of Art, and which they saw around them, had been chosen because their originals belong to that golden age of sculpture. Without desiring for a moment to utter even a hint of disrespect for our eminent modern sculptors, truth and candour compelled him to admit that posterity was unlikely to place reproductions of their works in schools of art as types of highest beauty to form the taste of future generations of students. But not alone in sculpture had the progress of art been in a backward direction. In painting, also, better work had been done by generations long since dead than by any school of painters now existing. Proceeding, Mr. Partington gave an interesting sketch of the Mediæval and Renaissance art periods, and contrasted the work of the artists of those epochs with that of painters of the present day. Among a crowd of geniuses, he mentioned for the purposes of argument the names of Titian, Tintoretto, and Paul Veronese, whose work, he said, was of such towering and indisputable superiority over all modern artistic production, that there seemed a touch of cruelty to our contemporary artists in the bare suggestion of a comparison. How was it that our fathers hundreds of years ago were able to do better work than any sculptor or painter who had lived since their time? Dealing with the question in a general way, he believed that neither in mental, moral, or bodily fibre had there been the smallest deterioration, taking the race as a whole. If, then, the answer was not to be found in the dwindling powers of the race, could it be to the meanness of our artistic demands and the falsity of our methods of artistic training? We must not look for a solution of the problem. There could be no doubt it lay with one or the other, or in both, of these causes. Describing the system of art training which prevailed in the early periods, he said a lad was then taught his trade as a painter in the same way that the old workmen of England were taught theirs; a master of his craft took him in hand, and showed him by actual work done before his eyes the methods of that trade, with what result we knew. Since the days of Rubens and Vandyke we had changed all that, and had come to think that the art could be picked up by the haphazard efforts of the student himself, if he was occasionally assisted by the oral direction of a gentleman holding a certificate from South Kensington. We had systematised and centralised our national art education, and the estimates for last year figured up to 438,558*l.*, and what did we get for it? A lad learned to paint by seeing the master paint, and not by being told how to do it by a gentleman who might or might not know his business. That kind of teaching which he advocated was absolutely antagonistic to the South Kensington methods,

and was a kind of teaching with which the Department had no sympathy whatever. The men who could paint, and teach others to paint, were not the men who held certificates as drawing masters from South Kensington. In that Stockport School of Art they would follow, as far as their abilities and opportunities would allow, the methods of the men who trained artists to be great before the South Kensington system was ever thought of.

#### PATRONAGE OF ART.

AT the opening of the Fine Art Gallery, Leeds, last week, which has been built from the designs of Mr. W. H. Thorp, Professor Herkomer delivered an address, in the course of which he said:—You all, I am sure, have a right to consider this a very important occasion. I can speak for painters—that they, too, consider it a very important occasion. I deplore the fact that I alone represent my London comrades. I think if they could have seen your new institution, and felt the influence of a little of the spirit which has brought it about, they certainly would have come. From a painter's point of view the whole thing may look very different, and, without occupying your time very long, I may just give you one or two of the ideas that have struck me whilst looking on. We painters are very much handicapped at the present time by a want of elasticity in the houses of private collectors. Their walls don't expand, and they have long ago filled them. Few painters—I think none—care to keep all the pictures they paint. It annoys them to see their pictures remaining constantly in their studios. Believe me that it is not the best work that always sells the most readily—the imaginative work, the work into which the painter has thrown his whole soul, which is less understood. These galleries should be receptacles of great imaginative works—works that are not pretty merely and pleasant to look at; let them be as tragic as you like, they will appeal to great masses of the people who could not see them in private collections. You see I lay much greater stress on your future collection than on your present loan collection. In England we are gradually forming in different great towns collections of pictures—I don't mean pictures that cannot be sold, but imaginative works. We have in the Royal Academy a fund essentially devoted to buying works that are of that character. Well, here you have almost a clear beginning; and I shall shock you, I have no doubt, when I say beware of gifts. Beware, above all things, of the old masters. These are the things that first creep into a gallery of this kind. What I preach is that you should have great work, great for its artistic qualities. Every phase of artistic work should be represented in such a gallery as this, and, believe me, such work can be represented in a very small canvas that has perhaps taken the painter only two hours to do. I will also suggest that you should get a large fund for the purpose of buying pictures. This building, I am told, has cost you nothing, and with such resources you can also get pictures, and before you have the funds quite in hand you should ask the first-rate painters to give you pictures. They will do so, I am sure, if you ask them in a nice way. There are many pictures—studies and sketches which they have used up in their other works—and what would be more interesting to the public, certainly to the working men, than to see how pictures are made? If you cannot get the larger work, get an engraving of it; and the studies you can get for nothing. Be very cautious in collecting; but not so cautious as to prevent you getting a few things to start with. I congratulate you with all my heart, and I believe the painters speak with me in that; and I am sure great things will be attained by you in art as have already been attained in matters of music.

#### OUTLAY ON THE GLASGOW EXHIBITION BUILDINGS.

AT a meeting of the Executive Council of the Glasgow Exhibition, held last Friday, Sir James King, Lord Provost, presiding, the statement of cost of the Exhibition buildings prepared by the architects and measurers, and submitted by the Buildings and Grounds Committee, was adopted.

Bailie Shearer expressed the regret which he was sure all of the members felt at the absence of Mr. Sellars through severe illness. He said it must be matter of congratulation to the executive and all concerned that, as far as the buildings were concerned, the excess of cost over the estimate was only  $7\frac{1}{2}$  per cent., or 5,333*l.* It was true that to that there had to be added sums for work which had been ordered since April, and which had not been included in the estimate of cost which was placed before the executive by Mr. Sellars. These sums, however, were apart from the main building, and included items such as the ceremonial arch, grand stands, barricades, the working dairy, and general jobbing. It was agreed that the closing day, as far as admission by payment is concerned, should be Saturday, November 10, but that the Exhibition

should be open on Monday, November 12, to members of the executive, guarantors, and their friends. It was stated that a concert would likely take place in the afternoon, and an address be delivered, probably by Sir Archibald Campbell, Bart., and the Exhibition declared closed.

The statement is as follows:—

	Estimated by Architects.	Final Cost.
Main building and machinery annexes, including special floors for the latter, granolithic pavement, steps, &c. . . . .	£ 43,600	£ 48,165
Foundations of main building and machinery annexe, deep digger work and rock cutting, machinery foundations, deep drains, steam pipe culverts, water-tank, &c. . . . .	5,973	6,025
Boiler-house, boiler-seats, and chimney-stalk . . . . .	2,300	2,286
Outside buildings connected with main building, such as stores, goods offices, Indians' houses, fire-engine and police-stations, &c. . . . .	825	976
Sundry offices, lavatories, linings and fittings in courts (Women's Industries, Artisans', and French Courts), fitting up bank and post office, police and admission offices, female attendants' room, &c. . . . .	1,800	1,829
Painting and decoration, upholstery, flags, &c. . . . .	2,500	2,328
Buildings in grounds—dining-rooms, tea-rooms, kiosks, drainage of grounds, &c. . . . .	6,000	5,974
Bishop's Castle . . . . .	1,800	2,035
New bridge . . . . .	1,200	1,202
Deepening of Kelvin . . . . .	830	1,121
Laying off grounds, formation of roads, cost of blaise and gravel, enclosure fences, gates, &c. . . . .	2,300	2,020
Total cost . . . . .	£69,128	£74,461

In the last item, the cost of laying off grounds, blaise and gravel, as executed by the gardeners, under the direction of the Building Committee, is not included, as the work was not contracted for nor measured, but was paid from time to time by the executive as it was executed.

The excess of cost over estimate is, therefore, 5,333*l.*, or about 7½ per cent.

To the foregoing, however, there falls to be added work ordered since April, and not included in the probable estimate of that date, as follows:—

	£	s.	d.
Ceremonial arch . . . . .	454	13	1
Grand stands, enclosures, railround track, &c., at recreation grounds . . . . .	1,833	8	4
Pedestal under the Queen's statue . . . . .	20	18	6
Landing-stages on Kelvin and rustic stairs . . . . .	124	15	4
Barricades . . . . .	27	19	3
Platform for fire-engine at bridge . . . . .	40	9	0
Bank Street entrance . . . . .	176	19	4
Renewal of flags . . . . .	76	7	0
Painting of fittings in courts for executive . . . . .	214	4	5
Balconies and other work at towers . . . . .	659	18	8
Enclosing main posts, pedestals under two statues, and work at fountain in main avenue . . . . .	223	18	0
Ventilating shafts at dining-rooms . . . . .	130	9	2
Fittings in Indian courts . . . . .	577	5	6
Fittings in educational court . . . . .	78	1	0
Work for Allotment Committee . . . . .	36	10	0
„ Advertisement Committee . . . . .	24	15	4
Removing and fitting up Chubb's strong room for fireproof doors . . . . .	63	1	0
Fittings in picture galleries . . . . .	50	10	7
„ machinery annexe . . . . .	241	4	0
Roads to boilers and goods yard, &c. . . . .	67	9	0
Railway and barricades . . . . .	46	7	1
Jobbings at Bishop's Castle . . . . .	123	7	8
„ Museum . . . . .	74	19	0
„ Bridges . . . . .	76	2	3
Fittings in executive office, Grey Street, and goods offices, &c. . . . .	174	8	5
Sundries for recreation grounds and sports . . . . .	120	12	6
General jobbings by bricklayers, joiners, and plumbers . . . . .	1,074	2	11
Engineers' office . . . . .	83	2	0
Cleaners' room . . . . .	49	8	8
Doulton's store . . . . .	32	6	2
Workmen's latrines and closets . . . . .	31	17	6
Gateways and hoarding next Dumbarton Road . . . . .	386	12	9
Stores next Dumbarton Road . . . . .	75	7	7
Outside lavatory at fire-engine station . . . . .	101	6	11
Indians' lavatory . . . . .	5	0	6
Urinal west of Indian Section . . . . .	15	15	9
Lavatory east of annexe . . . . .	65	6	4
Working dairy . . . . .	379	12	3
Band stand, south side . . . . .	214	5	11
	£8,253	8	8

The above sum of 8,253*l.*, added to the previous total of 74,461*l.*, makes a total of 82,714*l.*

#### MANCHESTER FINE ARTS ACADEMY.

THE annual address to the students of the life class in this institution was given by the president, Mr. R. Crozier, on Tuesday evening. As regards methods of instruction in art, opinions, in recent years especially, he said, have been very diverse, and yet it is admitted that a great advance has been made in English art—an advance no doubt due in a great measure to a more extended knowledge of the human figure. It is well known that of old art required an acquaintance with all matters coming within the range of its needs. Superficial knowledge did not then command respect for those votaries who were content to dabble in the shallows of art, unmindful of the more laudable ambition to execute work that would leave a mark upon the school or period in which it was produced. Drawing, or the power of expressing form truthfully, is undoubtedly the basis of all art work, although weakness or lack of knowledge in this respect may be to some slight extent compensated for by special beauty of colour or unusual skill in light and shade. The old masters must have devoted much time and trouble to gaining that proficiency which marks the accurate knowledge so evident in their work. Geometry, perspective, and human anatomy, with continued observance of the passions and emotions of the mind, all came within the range of their study; in short, they were unweariedly assiduous in their researches into everything that could add to their instruction or advancement in art. In studying from the model we cannot observe with too much accuracy. Exactness imparts understanding, and by it strength of hand is acquired and the true characteristics expressed. I cannot do better than repeat what I have previously laid stress upon, that in your study of the figure you will do well to consider the general structure as based on the skeleton and muscular development, and also the design as emanating from varied action. The simple principles of light and shade, if well understood, will lead you to the right rendering of parts, whilst a true observance of the general shapes and masses will give evidence of your individual appreciation and feeling.

#### GLASGOW ARCHITECTURAL ASSOCIATION.

AT the monthly meeting of this Association held last week, two short papers were read, the first by Mr. A. W. Beaton, on "Wrought Ironwork," in which a review was given of the history of this artistic as well as useful craft, which reached its highest development in mail armour. Ecclesiastic metalwork came next in importance, domestic examples of equal age being naturally somewhat scarce. Until but recently Glasgow possessed almost no example, but now the blacksmith's art was well represented, in the form of gates at least, in the Municipal Buildings, Commercial Bank, and Central Station. Numerous drawings and specimens of ironwork, lent by Mr. Adam, smith, were exhibited. The second paper was on "Church Organs," by Mr. Larment D. Penman. The disposition of the internal arrangement, as dictated by constructional and acoustic requirements, was first considered, and the too common error of packing into a small recess noted. The materials themselves, both metal and wood, were next described, and finally the organ as an architectural adjunct in form and decoration was discussed. Brief discussions followed the reading of the papers, and their authors were awarded the thanks of the meeting.

#### SANITARY WORK IN LEEDS.

THE annual report of the Sanitary Committee of the Leeds Corporation just issued states that overcrowding cannot be said to exist in Leeds to such an extent as in some other towns. Only 256 overcrowded houses have come under the notice of the health officer. In each instance notice was served upon the occupiers, and the notices have been complied with. During the year special attention has been paid to the habitations of the poor. The committee have been zealous in their efforts to abolish houses in such a state as to be unfit for habitation, or to have such as could be improved so repaired as to render them habitable. Upon the certificate of the medical officer of health, 76 houses have been closed, and most of them were pulled down, as there seemed no possibility of putting them into a habitable state. The number of other dwelling-houses repaired was 44. There are 80 lodging-houses on the list at present; 15 have been struck off the register as not complying with the regulations; and 640 visits have been paid to these houses. The number of drains inspected was 35,408, and 6,815 were found defective; 1,185 were tested by the assistant inspectors, and of that number 927 were found defective. Drains connected directly with the houses, all of which have been completely disconnected, amounted to 2,841, and drains relaid 1,637. These works were all in respect of old drains, but new ones have been laid to the number of 5,163.

#### Architectural Competitions.

SIR,—Will you allow us to state through your journal that we are now preparing a revised list of those architects who have signed an agreement not to take part in any public architectural competition unless one or more professional assessors are appointed to advise the promoters, and that we shall be glad to receive the signature of those architects who have recently started in practice, or have not yet signed the undertaking, and shall be pleased on application to send them the usual printed form.

The revised list will show a very considerable increase in the adherents, in spite of the inevitable loss by death and resignation, and there can be no doubt that a large measure of reform has already been the result of the efforts made to obtain, wherever possible, the appointment of a professional referee.—We are, your obedient servants,

COLE A. ADAMS, } Hon. Secs. of the R.I.B.A.  
ASTON WEBB. } Competitions Committee.  
9 Conduit Street, Hanover Square:  
October 10, 1888.

#### CHURCH BUILDING AND RESTORATION.

**Crowthorne.**—The dedication-stone of a new chancel to Crowthorne parish church has been laid. The contract for the work was taken by Mr. Parmenter, of Braintree, at 1,437 $\frac{1}{2}$ l. Mr. John Grundy, of London and Tyldesley, has carried out the heating on his hot-air system. The architect is Mr. A. W. Blomfield, A.R.A.

**Liverpool.**—The Catholic church of St. Anne, Edgehill, has been reopened after improvements, which included the lengthening of the nave, two new transepts, chancel, three side chapels, and sacristies. The plan of church as completed is in the form of a Latin cross, and the crossing is formed by four stone arches, one forming the chancel arch. The architect of the original structure was Mr. Charles Hansom, and the new work has been designed and executed under the immediate superintendence of Messrs. Pugin & Pugin, of Westminster. The works have been carried out by Mr. Thomas Urmsom, of Liverpool. Mr. M. Shamley acted as clerk of works.

#### SCHOOL BUILDINGS.

**Exeter.**—The foundation-stone of the new Middle School for Girls, which is to be erected in connection with the Exeter Episcopal Schools' Trust at Pennsylvania, to take the place of the premises at the old Post-office in Queen Street, which are now used for the purposes of the school, has been laid. The architect is Mr. James German, F.R.I.B.A., and Mr. William Gibson is the builder.

**Laverstock.**—A new day-school has just been opened. The buildings, which are designed to serve the purposes of a mixed school, are of red brick in late Gothic style, with large mullioned windows, four centred arches, and relieved by moulded brick labels, strings, and piercings, and wrought and chamfered barge rafters, with moulded ends to timber, and steep roofs covered with slates with moulded finials at the gables, the front gable being further enriched with a bell-cot projecting boldly from the wall and supported upon moulded stone corbels with date panel between same. The wrought-iron weather-tight casements were provided by Messrs. Burt & Potts, of London. The works have been carried out by Mr. H. J. Kite, of Fisherton, Salisbury, from the drawings and under the personal supervision of Mr. Fred Bath, F.R.I.B.A., architect, Salisbury, Mr. C. Adey and Mr. A. Rogers, both of Fisherton, Salisbury, executing respectively the stonework and the ornamental wrought-ironwork.

#### NEW BUILDINGS.

**Northampton.**—The corner-stone of parochial buildings for the parish of St. Giles has been laid. The buildings, which have been designed by Mr. S. J. Newman, architect, of Abington Street, Northampton, are being erected by Mr. J. B. Clark, builder, also of Northampton. The buildings are designed in Queen Anne style, and will cost about 2,800 $\frac{1}{2}$ l.

**Newcastle-on-Tyne.**—On Monday afternoon the foundation-stone of a new block in connection with the Whitley Northumberland Village Homes, Newcastle, was laid by the Countess of Ravensworth. The cost of the building will be about 2,000 $\frac{1}{2}$ l. Messrs. Oliver & Leeson, of Newcastle, are the architects.

#### GENERAL.

**Mr. T. C. Horsfall** will give a lecture on "Art in Education" during the present session of the Manchester branch of the Teachers' Guild at Owens College.

**Mr. Reckitt, J.P.**, Hull, has intimated his intention of building and establishing a free library for the eastern portion of the borough. The cost of the building, books, and endowments will amount to about 10,000 $\frac{1}{2}$ l.

**Mr. Charles Lynam**, of Stoke-on-Trent, has made an application for the county surveyorship of Staffordshire.

**M. Deperthes**, one of the architects of the Hôtel de Ville, Paris, has gained a second prize of 5,000 francs in the competition for the façade of Milan Cathedral.

**Colonel North**, of Eltham, Kent, who recently gave 5,000 $\frac{1}{2}$ l. towards the extension of the Leeds Infirmary, has contributed 1,000 guineas in support of the engineering department of Yorkshire College, in that town.

The "Tablet" says the Holy Father has been pleased to confer on Mr. Peter Paul Pugin the honour of a Knight of the Order of St. Sylvester.

The First Annual Exhibition in connection with the Yorkshire Union of Artists in Bradford will be held next month, and the sanction of the Free Library Committee of the Bradford Corporation has been obtained for the use of the Museum and Art Gallery in Darley Street for the purpose.

The Report of the Commissioner of Police of the metropolis for 1887 states that, since 1849 there have been built 500,852 new houses, while 3,463 are in course of erection, 1,833 miles of new streets have been added to the charge of the police, and the population has increased from 2,473,758 to 5,476,447.

At the Meeting of the Glasgow Exhibition Fine Arts Committee on Thursday last week, it was reported, in connection with the damage which was done to Mr. T. G. Arthur's picture *Les Danses des Nymphes*, by the rain in June last, that 500 $\frac{1}{2}$ l. had been recovered from the insurance offices.

"The Parliament House of Owen Glendower was," Sir P. Pryce Jones writes, "so long ago as 1881 doomed to demolition, and a proposal to acquire it for a local museum having been abandoned through lack of funds, I despatched an agent to Dolgelley with instructions to purchase the materials at any cost. These, having first been carefully marked, were removed to my residence at Dolerw, near Newtown, in the grounds of which they were re-erected some two years ago, under the superintendence of Mr. David Walker, architect, of Liverpool; and here I trust they may long remain a memorial of the past history of the Principality."

A Meeting of the Royal Commission appointed to inquire into the Metropolitan Board of Works affairs held a meeting last Friday, when the draft of the interim report was submitted for discussion.

The "Leeds Mercury," speaking of the Corporation Art Gallery on its being thrown open to the public, says among the visitors was Mr. Agnew, of Manchester, who was very liberal in flattering references to the Gallery, and went so far as to intimate that, had his firm been at all acquainted with the character of the accommodation provided, they would, despite the worth of the pictures lent by them for exhibition, have been pleased to have sent a more choice collection. Much interest was evinced in the small work presented to the Gallery by Professor Herkomer. The picture, which is in water-colour, has for its subject *The Road-Mender Receiving the Village News*.

The Eighth Annual Exhibition of the Dundee Art Club was opened on Tuesday evening. The rooms have been lately rearranged and newly decorated.

The School of Art Wood-carving, City and Guilds Institute, Exhibition Road, South Kensington, has been reopened after the usual summer vacation, and we are requested to state that one or two of the free studentships in the evening classes, maintained by means of funds granted to the school by the Institute, are vacant. To bring the benefits of the school within the reach of artisans, a remission of half-fees for the evening class is made to artisan students connected with the wood-carving trade. Forms of application for the free studentships, and any further particulars relating to the school, may be obtained from the manager.

Mr. E. E. Shortland, of Manchester and London, has just supplied his patent Manchester grates to the Isolation Hospital, Carr Gate, Lofthouse, Mr. W. Watson, of Wakefield, being the architect.

CRIMINAL PROCEEDINGS, under the new Merchandise Act, will be instituted against any person falsely representing any form of ventilator to be a Self-acting Air-pump Ventilator, said title being registered and our Trade-Mark, applicable only to ventilators manufactured by us. Any infringement renders the person infringing liable to two years' imprisonment. ROBERT BOYLE & SON, LD.

## CONTRACTORS TO H.M. GOVERNMENT.

INTERNATIONAL HEALTH AND OTHER EXHIBITIONS—MEDALS AWARDED FOR

# LEGGOTT'S PATENT ADJUSTMENT

CONTINUOUS OPENER.

SILENS.

THE SILENS, for Fanlights, Skylights, &c. Is admitted to be the best ever put before the Public. Can be adapted to any kind of window. Size and height of window no object.

From 4/3 each.

The WILMOS is worked with a rod or endless cord. It is extremely neat, and can be fixed to open either top or bottom, inwards or outwards; no cutting away of frame required. When worked with a rod is most efficient for Public Buildings, as the key can be loose. For Price Lists, Illustrations, and Testimonials, write as below.

For Continuous and other Lights, Estimates given.

WILMOS.

NO CUTTING AWAY OF FRAME REQUIRED.

### TESTIMONIAL.

SIRS,—I have pleasure in testifying that I have used Leggott's Silens Adjustments for various buildings to high skylights, fanlights, and top parts of windows, and in every case they gave satisfaction.

They are secure in whatever position, whether the window is open or closed, and are quite simple and workable in their action. I prefer them to any other that I have seen or used for the above-mentioned purposes.

Messrs. W. & R. LEGGOTT, Bradford.

I remain, yours obediently,

R. DAVIES, Architect.

BANGOR: N. Wales: Sept. 14, 1885.

Considerably Reduced Price List, November 1, 1887.

ALL WORK ENTRUSTED TO US GUARANTEED SATISFACTORY.

W. & R. LEGGOTT, General Brass and Ironfounders and Finishers, Makers of Patents and Specialities,

## TRADE NOTES.

THE green slates for the roofing of the mansion for the Earl of Sefton, K.G., at Abbeystead, Wyresdale (illustrated in *The Architect* of last week), were supplied by the Elterwater Green Slate Co., Ambleside.

AN award by Sir Thomas Martineau, the president-arbitrator of the Midland Iron Trade Wages Board, in the question lately raised by the ironworkers' application for the advance of 12½ per cent. in wages, is to the effect that puddlers' wages, which govern those of other classes of operatives, shall be raised on and after the 20th inst. from 6s. 9d. to 7s. 3d. per ton. This is an advance of 6d., or nearly 7½ per cent. This is subject to one month's notice on either side. At the meeting of the Midland Iron and Steel Wages Board, held at Birmingham on Monday, to consider the provisions for the establishment of a sliding scale to govern wages in the iron and steel trades within the area of the Board, Mr. B. Hingley, M.P., who presided, referred to the wages question just settled, and expressed a hope that the operative members were now convinced that the employers did right in referring the question to an arbitrator. The masters did not wish to throw any impediment in the way of operatives, though they had now the worst of the bargain, having made all their contracts for the next three months. With regard to the sliding scale, it was agreed that accountants should ascertain the figures for October, November, and December of all classes of iron, excluding charcoal iron. The names of about eighteen firms were then put forward, and the question of selecting those whose books should be inspected was postponed.

LARGE orders for steel for bridgework for the Bengal and Nagpur and another Indian railway have been received in Staffordshire. The Steel and Ingot Iron Company, Bilston, have booked four thousand tons, consisting mainly of plates, angles, ties, and bars. Also a Scotch bridge engineer has sent

## HOLDEN &amp; CO.'S ZINC &amp; COPPER ROOFING

orders into Staffordshire for large steel bars and angles for Indian bridge construction instead of buying in Scotland.

THE Goldsmiths' Company have resolved to contribute an endowment, out of their corporate funds, of not less than 2,500*l.* a year towards the maintenance of a Polytechnic Institute to be established at New Cross, on the site now occupied by the Royal Naval School.

A MANCHESTER Scotchman, writing under date of October 6, says:—Up to and including Saturday last, the Glasgow Exhibition had been open to the public 125 days. The figures relating to the Manchester Exhibition, quoted below, represent the attendances during precisely the same number of days, and also the corresponding days of the week:—

	Admissions by Pay- ment.	Season Ticket- holders.	Exhibitors and Attendants.	Total.
Glasgow .	1,952,940	1,978,982	328,817	4,260,739
Manchester	2,230,246	882,592	332,649	3,445,478

It appears, [therefore, that the] turnstiles have registered 815,261 more attendances in Glasgow during the period named than in Manchester. The season ticket-holders during the first three months were most faithful in their attendances. During August, however, they evidently retired "down the water," to recruit their energies, but in September they appear to have returned with redoubled force, for whereas a month ago their visits exceeded by 809,139 the corresponding attendances in Manchester, they have now sprung to 1,096,390 in excess. Some 47,000 season tickets have been issued in Glasgow, against 35,000 in Manchester. In Glasgow, therefore, each season ticket-holder has, on an average, paid 42 visits to the Exhibition, as against 25 in Manchester. Up to September 29, 277,306 more persons had paid for admission to the Manchester Exhibition than to Glasgow.

At the meeting of the Bridgnorth Town Council last week the committee appointed to superintend the repairs of the town hall reported the lowest tender to be that of Messrs. Bradney & Co., Wolverhampton, out of five contractors who sent in estimates. The above firm also secured the contract for carrying out the work proposed by the Jubilee Committee. In addition to the proposed alterations now being carried out, stained-glass windows will replace the old ones, the funds for this having been subscribed by private individuals. The report was adopted.

MESSRS. D. & T. STEVENSON, engineers to the Scottish Fishery Board for Harbours, have completed their survey of the shore at Auchmithie, near Arbroath, and furnished a preliminary sketch plan of the harbour which it is proposed to make there, which would cost about 4,000*l.* It is proposed to run a protection wall or pier along the inner line of rocks, enclosing the present beach, which is to be excavated.

IN their timber trade circular, dated the 4th inst., Messrs. Mackay, of Liverpool, say that the long-expected revival of trade has set in, and its effects are being experienced throughout Great Britain, Europe, and America. Shipping, both steam and sailing, is in demand for import and export trade, and rates of freight for all kinds of cargo have risen proportionately. For timber, particularly spruce deals, the demand has been during the past month a fair one. The imports during this period have not been large. The policy pursued by shipowners in now requiring "extravagant" rates of freight has had the effect of checking shippers from sending goods to this country. Unfortunately the freight rate seems still increasing.

THE Birmingham School Board has authorised the raising of a loan of 18,665*l.* for providing a site and school buildings in Cromwell Street, Duddeston. The schools are to accommodate 1,080 children, and the cost of the land, containing 5,150 square yards, is 7,500*l.*, and the builder's tender amounts to 10,083*l.*

THE two domes of the Palace of the Liberal Arts on the Champ de Mars, Paris, are finished, and only await the ceramic tiles on the roof, to the number of 100,000. These are of varying dimensions and colour, there being 630 sorts. The work will have the aspect of mosaic, the bricks not being superposed, but fitted into one another.

IT is proposed to introduce a system of heating by hot water for the church at Queensferry, N.B.

At the meeting of the Metropolitan Board of Works on Friday the following recommendation of the Building Act Committee was approved of. The committee reported, with reference to the letters from Mr. S. F. Clarkson, district surveyor, and the Vestry of Chelsea, relative to the erection of bay windows and balconies at No. 63 Cadogan Square, Chelsea, in despite of the refusal by the Board of August 10 last of their consent to the erection in question; and recommended that the Vestry be informed, in reply to their letter that they can take the necessary proceedings in the matter, and that Mr. Clarkson be so informed.

MESSRS. F. & H. FRANCIS, the architects of the Albert Palace at Battersea, call attention to the fact that all the interior fittings of that structure, including the great organ, are to be sold by auction next week, under distraint for rent, by order of the Office of Works, and have entered a protest against the prospective break-up of the interior of the palace at a time when a movement has been started to secure the building as one of the South London Polytechnics.

ON Tuesday possession was formally handed over to the Richmond Vestry, Surrey, of the Castle Hotel there, the gift of Sir John Whittaker Ellis, M.P.

A COLLECTION of photographs, chiefly picturesque subjects of a rustic or marine character, by Mr. Frank M. Sutcliffe, of Whitby, is being exhibited at the Camera Club, 21 Bedford Street, Covent Garden. The exhibition is the first of a series. Effects of twilight, moonshine, mist, wind, calm, sunlight, and shadow are depicted with most satisfactory results.

MESSRS. E. E. CROUCHER & CO. advertise a sale by auction of peculiarly choice sites of freehold building land at Crouch End, having frontages to Weston Park and other roads. This land, being close to three stations and surrounded by houses of a high class, will no doubt command considerable competition.

ALTERATIONS have been made to the Great Assembly Hall, Mile End Road, London, embracing the ventilation, Messrs. Robert Boyle & Son's latest improved patent self-acting air-pump ventilator being used for the extraction of the vitiated air.

THE Sanitary Committee of the Bradford Town Council intend to visit Leeds and other places, in order to inspect refuse destructor works, in view of erecting new works at Bradford.

AN inquiry will be held by the Local Government Board, on the application of the Scarborough Town Council, for sanction to borrow 10,000*l.* for works of street improvements, for providing stabling and a pinfold, and for purposes of public pleasure-grounds.

THE Carpenters' Company Free Lending Technical Library, containing the best works on carpentry and joinery, is now open every day from ten till four and Friday evenings from five till eight P.M., at the Company's Hall London Wall. Catalogues and full particulars may be obtained by application to the librarian.

THE wrought-iron opening casements for the residence, Abbeystead, illustrated last week, were made by Messrs. Burt & Potts, of York Street, Westminster. The stone and wood-carving were done from the designs of the architects, Messrs. Douglas & Fordham, by Mr. J. J. Millson, of Manchester.

A LYCH-GATE has been erected at the parish churchyard, Charlton Horethorne. The gates are about 3 feet high, hung with wrought-iron hinges, fitted with wrought-iron ring handle, latch, bolt, and Chubb's lock. The ironwork, including five hundred screws in the roof rendered rust-proof before being used, was supplied by Messrs. Priest & Sons, Bristol. The work has been carried out by Mr. Oliver Keeling, Timsbury, from the plans and under the personal superintendence of Mr. J. Spencer, architect, of Green Hill, Timsbury, Bath.

THE heating and ventilation of St. Paul's Church, Luton, Beds, has been carried out by Mr. John Grundy, of London and Tyldesley.

THE prospectus of the new company, entitled Messrs. Sam Deards & Company, Limited, has been issued. The company has been formed for the purpose of purchasing, continuing, and developing the old-established business of horticultural and hot-water engineer, carried on by Samuel Deards, and of the patents of "Victoria Dry Glazing," "Champion Coil Boiler," and "Princess Louise Coil Grate."

#### SAFETY OF BUILDINGS IN THE CITY.

AT the meeting of the City Commissioners of Sewers on Tuesday, Mr. Moore drew attention to the serious subsidence of property in King William Street and Arthur Street West, which was alleged to be due to the construction of the subway under the Thames to Southwark. The premises were all highly rented, and one set was rated at 1,500*l.* It was an extraordinary thing to see such buildings literally held up by crutches. The engineer stated that the subway was being constructed by a company under statutory powers, and the matter was in the hands of the district surveyor. Mr. Moore observed that something ought to be done to protect the occupiers. Mr. Bridgman said he would move that it be referred to a committee to inquire what steps, if any, were necessary to be taken to insure the public safety. The solicitor pointed out that the public safety was in the hands of the district surveyor.

## PROGRESS OF A SCOTCH TOWN.

At the last meeting of the present Town Council of Ayr, held on Monday, Provost Kilpatrick, who presided, said that he did not intend to seek re-election to the Council. He thanked the members of this and the previous Councils for the consideration they had always extended to him during the six years he had been provost of Ayr. In that time work had been done and measures carried through which he hoped would prove of great benefit to the town. In the first year he had been elected provost the question of the new bridge had come up. The Town Council had found that the Bridge Trust was insolvent; and as the bridge would ultimately fall to be taken over by the town of Ayr, the Council had conceived it to be their duty to take up the matter at once, and after many meetings with the County Road Board an agreement had been made whereby the county of Ayr undertook to pay nine-twentieths and the town eleven-twentieths of the debt. This debt had amounted to something like 13,000*l*. They had fifty years to liquidate the debt, and he believed that in two or three years the Bridge Committee would be enabled to reduce the assessment. The next question that had come up before the Council was the question of an additional water supply for the town. For some summers before the new scheme was promoted there had been a scarcity of water, and it had to be shut off the town during the night. The Council of the day felt that the matter was urgent. Mr. James Wilson, C.E., Greenock, had been called in to report upon the scheme. Mr. Wilson's report was against the extension of the old works. Recourse was then had to what are known as the Straiton Lochs, and Loch Finlas was eventually recommended as the source of supply. After getting an estimate of the cost the Council resolved to adopt the scheme and apply for a Bill. If they had not done so, for the last two years during the summer months the town would have virtually been without water. Although the assessment had been raised during the next eight or ten years, the water rate would be as low, if not lower, than before. They had been able to carry out the scheme without any Parliamentary opposition, and he believed they had constructed a scheme at less expense than any other scheme of a like magnitude in the country; and he believed that it would be found to give an ample supply of water to the town for many years to come. Without this new scheme building must have inevitably come to a standstill, as with the old scheme they would have been unable to supply many of the buildings in the town with a water supply. Then in promoting

this water Bill they had included in it a scheme for the improvement of High Street and Kyle Street. The properties necessary for the carrying out of this scheme had now been nearly all acquired, but there was still work to do in the carrying of this scheme to completion. Another feature of the Bill was the obtaining of the extension of the burgh, which feature he thought was a most important one. The burgh was now nearly double the size that it was before the passing of the Bill; and although at present it had not probably done them much good as far as rating was concerned, he looked forward in the course of the next twenty or thirty years, in the expectation that the extension of the boundaries would materially lessen the rates in the burgh. But the paramount object they had in view in the extension of the burgh, he might mention, was to enable the Council to carry out the drainage of the town properly. But though this much had been done, there was still work to do. There was the completion of the improvement scheme, the new cattle market to be laid out and constructed, and, though much had been done in the repairing of the streets and roads within the town, there was still much to do.

## THEATRE EXITS AND FIRE RISKS.

APPLICATION was made on Monday before a Court of Justices by Mr. Cecil Beryl for renewal of the license of the Grand Theatre, Glasgow, in the name of Mr. Augustus Harris, of Drury Lane. Mr. Dunlop, of Tollcross, presided.

Mr. Angus Campbell, who appeared for Mr. Beryl, in submitting the application, said that Mr. Beryl had held a license for a theatre in Glasgow for nine years, without any exception being taken to his management or the slightest complaint being made against him. The Grand Theatre had been altered and reconstructed so as to satisfy the requirements of the Court and of the Master of Works. Mr. Harris's lease expired in November, but Mr. Harris had no objection to the license being made out in Mr. Beryl's name. He submitted that there should be some slight modification of the regulation relating to the number of firemen in a theatre. A reduction, he thought, might be effected without any disadvantage to the public and with considerable advantage to Mr. Beryl. There were at present in the theatre four firemen and constables, at an expense of 3*l*. 15*s*. per week for the whole. Half that number was sufficient. The theatre was quite close to the Northern fire and police stations.

And by an  
Adhesive & Preservative Mastic  
Speciality: OAK AND DARKENED OAK.

The Chairman said that on a former occasion some discussion took place as to the power of the Court to deal with overcrowding. They must, in the interests of the public, have some control in this matter, and if there were no rules upon the subject in the Act of Parliament, then the Court must make rules, and attach them as conditions to the granting of the license. He asked Mr. Beryl if he objected to the rules which the Justices had drawn up against fire.

Mr. Beryl: No, I do not.

The Chairman remarked that Mr. Harris had objected to them.

Mr. Campbell submitted that Mr. Harris did not object to these rules; but he was brought into a criminal court, and there had a right to state any technical objection.

The Chairman said there was another rule which ought to be enforced: that against crowding in the passages.

Mr. Campbell: The rule is undoubtedly in the license.

The Chairman said he understood Mr. Beryl objected to it.

Mr. Beryl said that on the occasion to which the Chairman referred the case against him was never called.

The Chairman: I recollect you perfectly well. You said it was a very serious matter to you, because if the rule was enforced it would be the loss of so many hundred people.

Mr. Beryl: I don't recollect saying that.

Mr. Campbell said that on the occasion spoken of he appeared for Mr. Harris. What Mr. Beryl said then was, with all deference, that he had special leave in the South-Side Theatre for people to stand at the back of the pit; Mr. White said there was standing room. Under the rules applicable to his late theatre, Mr. Beryl had special permission for some 300 to stand behind the pit, and that was to be taken away when the license was renewed.

The Chairman: That will be taken away now, then.

Mr. Campbell: But this is a different theatre under different rules. We accept the rules and regulations laid down by the Court for the government of the Grand Theatre in their fullest integrity.

Mr. Gray (assessor): Yes, but with this addition. Rule 10 is—"No chairs or other loose article, or other obstruction, shall be placed in the lobbies, passages, or stairs." I understand the chairman to suggest that no person or persons shall be seated or allowed to stand there.

The Chairman: Yes.

Mr. Beryl: I quite agree to that.

Mr. Gray: Then Mr. Campbell has suggested that the number of firemen and constables should be reduced from four to two.

Mr. Campbell stated that at the Grand they had the largest permanent staff of any theatre in Glasgow.

The Chairman said that the payment of the firemen and constables was a very serious tax upon the lessee of the theatre, and he did not know that so many men added much to the safety of the public. If they had one practical fireman, and were so close to a fire-station, he did not think they wanted more.

The license was granted, under the additional restriction suggested by the chairman, and at the same time permission was given to reduce the number of policemen and firemen by half.

#### SHEFFIELD SHIP CANAL.

THE preliminary survey in connection with the scheme for the construction of a canal from Sheffield to Goole is practically completed, and the report of the engineers will be shortly made. The chief promoters of the scheme have had a meeting with the engineers at Goole, and went over the Aire and Calder system, starting at Ferrybridge and going down to Goole. There the docks were carefully inspected, as well as the various appliances for the prompt shipment of coal. Proceeding along the Ouse and Trent to Goole, they inspected the shipping accommodation, and afterwards followed along the Goole and Stamford canal system to Doncaster, and the canal system between Doncaster and Sheffield. A general agreement was formed, not only as to the practicableness of the scheme and the route the canal should take, but also that it could be carried out at a moderate cost. The fund for defraying the preliminary expenses amounts to 1,725*l*.

#### A VIENNA THEATRE.

THE perfection of theatre building has been attained in Vienna, if the opinion expressed by the Emperor of Germany on occasion of a visit just paid to the building can be relied on. Since that visit a Vienna correspondent of the *Daily News* has furnished the following account. It may be thought at once be pointed out that in the last lines of the letter the design of the structure is credited to the architect, as the correspondent at the outset creates an impression that architects had to be set aside and the hospital doctor called in to do the work:—

The new Burg Theatre at Vienna, says the correspondent, is a marvel in many respects. Its beautiful situation, its unrivalled architectural beauty, the wealth of its decorations, the perfect taste of all its arrangements, are but on a level with all that has been done for the safety, the wellbeing, and comfort of the public. Opinions may perhaps differ, as people's tastes differ, whether the new Burg Theatre is to be called the most beautiful theatre in the world, but all must agree that it is the best lighted, best ventilated, and safest of all theatres that have as yet been built. When almost twenty years ago the Vienna Opera House rose on the bastions of the ancient city, the Emperor of Austria consulted first of all, not architects and artists, but the director of our great hospital as to what he thought the public wanted most when it sat for hours in a crowded house. At that time a new system of ventilation was tried, which succeeded so well that it has long been a saying in Vienna that there was no better way of spending an insupportably hot summer evening than by going to the Opera. The excellent system of ventilation has been improved upon, and may be said to have reached perfection in the new Burg Theatre. Three storeys below the auditorium and stage runs a broad, vaulted corridor of great height, which leads to a circular cistern through which the outer air is sucked from the Volksgarten. A strong current is blown into the subterranean gallery, where it passes over six hundred tin trays filled with water, and through damp flannel screens, so that it enters the inner corridors purified of dust, and quite damp.

The current is formed by a kind of windmill, a circular wheel with shovels, through the centre of which passes horizontally an enormous regulator, having the shape of a torpedo, which prevents the air from whirling in the wheel, and directs the current to a circular room, where it blows up against a wall, in the centre of which is a sharp projection which divides the current into two halves, one for the use of the stage, the other for the auditorium. The air now enters cylinders, which are kept warm by steam-engines. In the storey above the warm and cold air are mixed by an enormous tube, and when it is the right temperature it passes through a great number of tubes with valves into the auditorium. The greatest marvel is the inspection-room, with its handles and taps, its telephone and measuring instruments. With a slight movement of the hand it is possible to regulate from this room the current of air that enters the house, by means of chains to the doors below; to increase or decrease the heat and dampness, and to give

more or less ventilation to every seat or box in the house. Nearly one hundred thermometers and anemometers are in use for the perfect regulation of the beautifully-ventilated house. There are ten boilers and three large steam-engines, the latter for the exclusive use of the ventilator. The pure air reaches to the very top of the house, and the current escapes by a circular gallery in the roof, which on the outside is masked by a gilt iron railing.

The theatre is lighted with electricity throughout, and much thought has been given to the elegance and variety of the candleabra. In all there are 5,000 incandescent lights within the house, besides the great arc lights outside. The electric light is not produced in the theatre, but at the works of an English company in the Schenkenstrasse close by, and the electric current is led to the theatre underground. All over the theatre are distributed in small intervals red lanterns holding wax candles which are long enough to last through the evening, and which are sufficient to give light in case the electric light should by any chance be extinguished.

The theatre faces the Ring in its handsomest part, and is semicircular in front, square at the back. The semicircle forms in four storeys the entrance and three foyers, embracing the four tiers of boxes and the parterre. The square part at the back forms the stage. Two wings projecting on either side of the semicircle are entirely taken up by the staircases, under which are two private entrances, one for the Emperor's and the other for the Archduke's carriages. The public drive up under a covered doorway at either wing and at the foot of the great staircases. The occupants of the stalls and circle enter by the front, through nine large doors. The staircases at either side are lofty, broad, and entirely of marble, with railings of wrought and gilt iron. The staircase ceilings are divided into four great central pictures, showing the development of scenic representation from its first beginnings to the present day. At the top of each staircase there is a vestibule, separated from the former by two open niches, in which stand beautiful sculptured marble groups. On the staircases there are eight marble figures in niches, the portraits of the most famous actors of all times and nations, represented by Thespis, Kallipides, Quintus Roscius, Richard Burbage, Sebastian de Prato, Maria Calderon, Jean Baptiste Poquelin (Molière), David Garrick, Caroline Neuber, Friedrich Schröder, Conrad Eschhof, Wilhelm Iffland, Ferdinand Fleck, Ferdinand Esslaire, Louis Devrient, Carl Seydelmann. In the gable over the doors of the vestibules there is a marble group representing Bacchus and his train on one side,

COVENTRY.

London Address:

398 Fulham Road, S.W.

and Apollo on the other; and along the ceiling of the staircase there are twenty allegorical figures by Düll, and six ideal heads by Bager. The ceilings of the vestibules have two theatre scenes—one the Passion Play of Oberammergau, the other a modern theatre, both by Karger. There are four niches in each vestibule holding the life-size marble statues of Josef Talma, Edmund Kean, Rachel Felix, and Adelaide Ristori, being the most famous actors and actresses of all, and four celebrated directors of the old Burg Theatre—Sonnenfels, Schreyvogel, Laube, and Dingelstedt. Marble figures of children holding emblems and the Imperial arms are placed above the doors of these vestibules, which on one side lead to small circular refreshment-rooms, the walls of which are of polished marble, whilst the semicircular spaces above are painted with lovely children, flowers, and birds in delicate colours, by Robert Russ; and the ceilings, representing the fruits of the earth, by Hugo Charlemont, which in contrast seem rough and out of place. The refreshment-rooms at the two corners of the house lead into the great foyer, which takes up the whole front and forms part of a circle. This is a most splendid apartment, which may successfully compete with the galleries of Versailles and Herrenchiemsee. The walls of polished marble, with brass ornaments, are adorned with elaborate paintings of famous actors and actresses of the Burg Theatre in the costumes of their favourite parts. These portraits were found in Imperial lumber-rooms, and have been repainted, and as they are all quaint and original the effect is very good. But the chief beauty of the foyer is the three colossal pictures which adorn the ceiling, and in one of which Edward Charlemont, who painted all three, has given us a masterpiece. In the centre is Apollo with the Muses; to the right the Drama, being pictured by Iphigenia in Aulis; to the left Comedy, as shown in a "Midsummer Night's Dream." It is this picture which will attract connoisseurs long after the Burg Theatre will have ceased to be a novelty. In a wonderful moonlit landscape, which has nothing theatrical about it, move all the quaint or beautiful figures from the Dream, personified in so delicate a manner as to enchant both the eye and the heart.

The passages leading from the foyer to the large Court box and to the galleries behind the boxes in the first tier are lined with pictures of past actors, all found in the old Burg, and now looking quite handsome in panellings of carved oak. The passage to the Imperial box first leads to a reception-room daintily furnished with rococo embroidery and damask in pale

colours, that look as if a century at least had toned them down. The carved doors on this floor are also worth seeing, as models of a new industry of Vienna. The upholstery of the Court box, as indeed that of the whole theatre, is crimson plush with gold embroidery, but the woodwork in the boxes is not gilt, but carved oak. After the staircase and the foyer, the theatre appears small at the first glance, until we remember that it is exclusively devoted to drama, and cannot for reasons of acoustics be any larger. The ceiling is decorated with a wealth of paintings, and is divided into four fields by plastic groups representing the four essential qualities of human nature.

So much for the beauty of the new Temple to the Muses; now for the safety. Iron and stone are the two materials used almost exclusively. On the stage nothing but the thin flooring is of wood; everything above and below is of iron, of which two million kilogrammes have been used. For the shifting of the scenes ironwork is exclusively used. The stage is in reality 31 mètres broad, nearly 100 English feet, but 20 feet are taken up by the side scenes. It can be pushed backwards and forwards, raised and lowered, and the change of scenery is effected by slight movements, and without the least noise or danger. Hydraulic power is used. If as much iron as possible was used in the audience-room, nothing but iron is the material forming the stage and its complicated apparatus above, below, at either side, and behind. It would be impossible to set fire to this part of the theatre. The decorations for the different scenes are not kept here, but at a dépôt some distance from the theatre, whence they are fetched in enormous carts. The iron curtain, a *sine qua non* in Vienna theatres since the burning of the Ring Theatre, is as clever a contrivance as was ever invented. It is double, and if let down gently falls without the slightest noise, but if the handles are turned with a jerk it fills itself with water. Of course the firemen are acquainted with its qualities, but even if they were not, there is every probability that in case of a fire it would not be handled gently. The curtain is painted as a wrought-iron gate, through which Vienna is visible. The large curtain is the work of the painter Fua, and represents the human passions and likings as they are represented on the stage. For use between the acts an old curtain of the Burg was widened and renovated. It is by Fuger, and represents Apollo and the Muses.

The actors have every cause to be grateful to the builders of the new theatre. Their dressing-rooms are lofty, bright, close

to the stage, and furnished with every comfort that could be placed in a limited space. Polished maplewood is the chief feature; and mirrors, wardrobes, cupboards, paint-drawers, are all fixed in the walls and open in unexpected corners. Yet there are old *habitués*, men closely connected with the theatre and its actors, who say they will not play so well in the new as they did in the old house, who think the halo which shone so brightly over the poky old Burg in the Michaelerplatz will disappear for ever under the dust of the stones as they are pulled down one by one. The new Burg Theatre is the work of Baron Hasenauer, who drew the plans for it as long as twenty years ago, some of them together with Semper, who is dead now, and who designed the museums, the new Burg Palace, the theatre, and many more monuments of architecture for his younger partner Hasenauer to complete. Among the able staff of architects and engineers who aid him in the arduous task is Victor von Weymann, who, when he speaks of the opening of the new Burg Theatre—not a stone of which has been fixed in its place except under his vigilant eye—speaks like a mother who is about to see her firstborn married and lost to her for ever.

#### MINING INDUSTRY IN BRITAIN.

ON Tuesday Professor Arnold Lupton delivered a lecture at the Yorkshire College, Leeds. He began by stating that coal mining was by far the most important branch of mining in Great Britain, and also the most recent. Five hundred years ago coal mining was hardly known. At the present time, out of the total mineral production of the United Kingdom, valued at, say, 60,000,000*l.*, 40,000,000*l.* was in coal. Metal mining was more ancient than the earliest records. The mining of metals was mentioned in the Book of Job, but there was no reference to coal mining. Great Britain was endowed with a store of mineral wealth which embraced nearly all the metals and minerals for which the earth was mined. There were a few notable exceptions, such as quicksilver, platinum, diamonds and rubies, and other precious stones. But gold, silver, tin, copper, lead, arsenic, iron, manganese, coal, cannel, jet, gypsum, salt, slate, freestone, fire-clay, and many other minerals were found and mined. Mining could be done on the whole as cheaply in Great Britain as in any other country, because we possessed the skilled labour, the fuel, the water power, and the machinery that were necessary. Gold was mined in Wales in

the time of the Romans, and at intervals since then. Within the last thirty years a good deal of gold had been got from quartz veins in the neighbourhood of Dolgelly, upwards of 40,000*l.* worth having been got out of one mine, and there had been periods of excitement and speculation, but all the mines were closed again. Quite recently Mr. Pritchard Morgan had reopened a mine in the Mawdach river, and had found a vein which undoubtedly contained some very rich ore. Describing the mines at Northwich, he explained that they were worked like mines of thick coal, but had the advantage of a very good roof. Brine was pumped from abandoned salt mines, causing eventually great subsidence of the surface and destruction of buildings; but the people of the salt districts well understood that "their prosperity is founded on the abstraction of their foundations."

#### THE THEATRE ROYAL, DUNDEE.

THE old Theatre Royal at Dundee was destroyed by fire on Saturday. It had been used as a music-hall for several years, and was undergoing extensive renovation preparatory to reopening this week. The fire broke out shortly before 2 A.M., and raged fiercely until four o'clock, by which time the building was entirely gutted. The houses immediately adjoining the theatre are thickly tenanted, and widespread alarm was caused among the occupants. The total damage done is calculated to amount to about 6,000*l.* This theatre was long the principal house in a city which appears to have been distinguished in very early times by its hospitable reception of companies of actors. Though partly reconstructed about fifty years since, the structure was erected in the first decade of the present century, and was a commodious house for a country theatre of the time, being capable of seating 1,400 persons. Mr. Samuel Bell, architect, prepared the plans in 1808.

#### THE SANITARY INSTITUTE.

THE first meeting of the Council of this Society, which has recently been incorporated, was held at the Parkes Museum on Friday. Sir Douglas Galton, K.C.B., F.R.S., was unanimously appointed chairman of the Council, and Mr. G. J. Symons, F.R.S., the registrar. The institute is founded to carry on the objects of the Amalgamated Sanitary Institute of Great Britain and the Parkes Museum, and it was decided to hold the insti-

## GRUNDY'S PATENT WARM-AIR VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

#### TESTIMONIALS.

9 Victoria Chambers, Westminster, S.W.  
SIR.—I have much pleasure in testifying to the efficiency of your patent warm-air fire-grate. It has been very successful, and given every satisfaction where I have used it.  
Yours, &c., JAMES WEIR, F.R.I.B.A.,  
To Mr. Grundy, 6 John Street, Bedford Row, W.C.

From ARTHUR W. BLONFIELD, M.A., Esq., Architect,  
24 Montagu Square, London, W.

Mr. Grundy, of Tyldesley, near Manchester, has carried out his plan of warming in several churches built under my direction, and in each case it answers remarkably well, and has given great satisfaction.

From Professor W. B. ROBERTSON, M.D., West Dulwich, S.E.,  
September 1, 1887.

DEAR MR. GRUNDY.—I value your apparatus very highly indeed. I regard it as the greatest comfort I have in this house.

From Rev. A. FERGUSON SMYLY, Dean of Derry, The Deanery,  
Derry, September 16, 1887.

DEAR SIR.—I cannot refuse to give you a few words of commendation as to the apparatus you supplied for heating Derry Cathedral. Not only is the air of the Cathedral quite pure and pleasant to those attending the services, as it must be from the fact that most of the air heated is taken from the outside, but I find the building itself is so much benefited, as formerly it was damp and smelt damp, but now it is very dry and free from any musty smell. I find that, although the Cathedral is now much larger, the cost of firing is much less.

To Mr. John Grundy, 30 Duncan Terrace, City Road, London.

From Hon. and Rev. G. G. C. TALBOT, M.A., Withington,  
Cheltenham.

DEAR SIR.—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.

Mr. John Grundy.

tute's first examination for local surveyors and inspectors of nuisances on November 8 and 9. A programme of lectures for the winter session is in course of preparation. A letter was read from the Charity Commissioners saying that they considered that the new institute was likely to prove a powerful means for the diffusion of sanitary knowledge, and promising to grant facilities to the institute to deliver lectures in the various buildings which the commissioners proposed to establish in different parts of London.

#### CHEADLE AND GATLEY MAIN DRAINAGE.

THE scheme of Mr. J. B. Everard, M.Inst.C.E., of Leicester, has been placed first in the competition for the main drainage of Cheadle and Gatley, near Manchester; that of Messrs. Brierly & Holt, of Manchester and Blackburn, second; and that of Messrs. Landsborough & Preston, of Bradford, third. We understand that Mr. James Mansergh, sanitary engineer of London, has been called in by the Local Board to advise them in making the award. The amount of the estimate for the successful scheme was 23,300*l*.

#### TEACHING OF DESIGN FOR INDUSTRIAL WORKS.

AN address in connection with art teaching in relation to technology, entitled "Pictorial and Decorative Art," was given by Mr. C. Stephenson at the opening of the general art classes of the Yorkshire College, Leeds, on Friday evening last.

Mr. Stephenson began by saying that the difference between pictorial and decorative treatments was not sufficiently understood. Decorative designs were constantly criticised by the principles of pictorial painting, even by people who had a fair knowledge of pictures. But what was much worse, one often heard works of art criticised according to what people called their "fancy." This was very unfair to the artist. Pictures should be criticised according to certain principles just as much as other things, and we should educate ourselves by a right study of these principles, in order that we might appreciate what was acknowledged to be good in art. It was to the Middle Ages that we must look for the finest gems of decorative art, when were built those fine churches and palaces, enriched with matchless stained-glass windows, and adorned with splendid carvings in wood and stone, the like of which had

never since been equalled. Easel pictures—those that were framed and hung on our walls—were then almost unknown, the nearest approach being the altar pictures. In the present day everything was turned out by piece-work. The artist and decorator or designer were now two different persons. Easel pictures were the outcome of modern ways of living. In the olden times our forefathers who were in a position to build houses of their own could count on living in them for the rest of their lifetime. Consequently they decorated them with paintings let in as panels in the walls. Social changes now took place so rapidly that paintings were placed in frames and made portable. To produce a work of art the qualities of mind required were two—the power of imitation and the power of design. Some artists had the faculty of design more strongly developed than that of imitation, and would naturally devote themselves to decorative and imaginative work. He should define a picture as a rendering by means of colours, in black and white or relief, of some object without any reference to where the picture would be placed, or to what its surroundings would be. It was usually placed in a frame to isolate it from its surroundings, and it was in this isolation that the chief difference lay between the pictorial and decorative treatments. A decorative work might be a representation of the same object, executed in the same materials; but it was usually rendered in a more or less conventional manner, and should in all cases be executed with a regard to the surroundings it would have in order that everything might be in perfect harmony. It was in our own homes where we could best indulge our taste for art, and it was desirable that something should be known about ornamental art as applied to domestic decoration. It was not the designer's aim to give a realistic imitation of any object; that belonged to pictorial art. An exact imitation was, he believed, out of place. Not long ago it was a common thing to see carpets, the designs of which were composed of huge bouquets of flowers in gaudy colours. The object of the designer seemed to have been to rival the artist who painted on paper or canvas. But however much he seemed to imitate nature it was a bad attempt on account of the coarse material he had to deal with. It was better for the designer to confine himself to flat conventional forms, without light and shade. Then, again, there was fitness in things. The idea of walking on a number of bouquets of flowers was not a pleasant one. In recent years carpet manufacturers had been beneficially influenced by the large importations of Persian carpets. In these the sense of propriety was never outraged. In wall-papers again, flatness was desirable, though not to such

a great extent as in carpets. In all cases the colour should be quiet and subdued, because the wall-paper was only intended as a background for the other objects in the room, and should therefore be retiring. The interest in a design should be in proportion to ingenuity and artistic feeling it displayed, and not in its imitation of nature. Pictures might be divided into three classes—the idealistic, the historical, and the realistic. The idealist painter was akin to the decorative painter. He went to nature for his subjects, and beautified and enriched them by his imagination. In the historical picture one expected to see an event portrayed with all attendant details, and with attention to truth. It must also be presented with force and dramatic feeling. In the realistic school, the pictures were little more than transcripts from nature. The subjects chosen were usually those of everyday life, and the artist did not attempt to idealise his models, but copied them as he found them. He recommended them to study the collection of pictures at the Leeds New Art Gallery. They would also find in the gallery a choice collection of decorative works, mostly from the South Kensington Museum.

#### HARVEST FESTIVAL AT THE ALEXANDRA PALACE.

THURSDAY, the 18th inst., promises to be one of the most brilliant days which has been witnessed at the Alexandra Palace during the season. The general manager is arranging an Harvest Festival at the Alexandra Palace which will eclipse all the Bank Holiday programmes, and offer a day's treat such as can be experienced at no other place of entertainment in the Metropolis. The most elaborate preparations are being made to render the enjoyment of those who attend complete. We understand that there will be harvest decorations in the Central Hall, with trophies of corn, fruit, flowers, and vegetables. The small stage of the Central Hall will be the scene of two of the best variety entertainments that have been given at the Palace, many celebrated artistes having been secured for this occasion. We believe that there will also be arranged a grand ballad concert, to be given in the theatre, and at which a number of the leading vocalists who have appeared at the Palace grand concerts will give their services. The concert will take place at 5.30 P.M., and terminate at 7.30 P.M., after which Messrs. Pain & Son's grand representation of the Last Days of Pompeii—which has been already witnessed by over a million of people—will be produced on a

scale of unexampled grandeur, and will be followed by a magnificent display of fireworks, concluding what will undoubtedly prove to be the best day's enjoyment ever organised at the Palace. Besides the special arrangements for the day, there will be the attractions of the International Circus, the Picture Galleries, and the Life-saving Exhibition. Many new appliances for saving life from loss by shipwreck or fire have now been added to this exhibition, and the whole is now rearranged in the enormous hall known as the bazaar. An inspection of this exhibition alone amply repays a visit to the Alexandra Palace, for there is now an excellent display of life-saving apparatus, from the ancient appliances of our forefathers to the most advanced scientific ones of the present day. Of all the exhibitions of the present year, none are more interesting and valuable than this one, whether the visitor is a seeker of pleasure, whether interested in humane work, or animated by a desire for instruction, and it may well be borne in mind that the object of bringing these inventions together is to promote the saving of human life from loss either by drowning or being burnt.

#### EARLY SMITH'S WORK.

A LETTER appears in the *Times* of the 6th inst., in which the writer says:—When many years ago I used to go sketching about this fine old church (St. Albans Cathedral), there was a door in the south transept, covered with ironwork of early date and beautiful design, which was a favourite subject among architectural students. Last Bank holiday I revisited the abbey church, and noticed that the old door was gone and a new plain one of oak in its place. Afterwards, in walking round outside the south wall of the nave, I observed lying among some builders' rubbish a fragment of an old door, which, from the markings on it and remains of pieces of rusty iron still clinging to nails, I at once recognised as a piece of the famous door of the transept, which used to be regarded as one of the "choice bits" in the church.

#### DUBLIN SCIENCE AND ART MUSEUM AND LIBRARY.

THE outside of the museum is now, the *Irish Times* says, completely finished, the materials of which it is composed being Mountcharles cut stone, with dressings of granite from the Bessbrook quarries, as well as from Dublin and Wicklow, and

PATTERN BOOKS ON APPLICATION.

the effect is highly pleasing, viewed from the courtyard of Leinster House. A number of men are still engaged working at the annexe, which will shortly be finished. Inside of the museum all the plastering work of the building has been completed. The interior of the rotunda dome contains enriched pilasters, caps, and bases, and there is a gallery supported on marble columns, with bases of Bath stone, carvers being at present engaged on a marble hand rail at this point. All the ground floor is finished with mosaic tiles in figured designs. The principal stairs leading to the first floor are of Portland stone, and on these stairs the first landing is supported on marble columns with Bath stone arch. The first and second floors are laid in oak, and the carved walnut doors are fine examples of artistic skill. Messrs. Musgrave & Co., of Belfast, have supplied the heating apparatus for the museum, and for the library a similar service has been rendered by Messrs. Hodges & Son, of Dublin.

The chief Irish marbles used in the buildings are black Kilkenny, red Midleton, red Little Island, green Lisslaughter (County Galway), Moneen, Glenowen, Rosksa, Mitchelstown, Erne fossil, and Bessbrook, and there are several examples of foreign marbles from Brescia, Sicily, Verona, Genoa, Sienna, and Belgium, the latter being a handsome black-and-gold pattern. Some Derbyshire spar is also used. Messrs. Doolin & Robinson, of Belfast, executed the marblework in a superior way, and the granite columns have been extremely well done by Messrs. Flynn, of Bessbrook. Irish firms have got a considerable share of the fittings required at the museum and library, though a good many contracts were placed at the other side of the Channel. The steel decking floors of the library were manufactured by Messrs. Lindsay & Co., of Paddington, London, and the pavilion floors were made by Messrs. Homan & Rogers, of Manchester, while the central court gallery floors are the work of Messrs. Dennett & Ingle, of London. The curved girders of the long galleries have, however, been executed by Messrs. Stephens & Co., of Dublin, who have also done the ironwork of the domes, while Messrs. Young & Co., of the Eccleston Works, London, have furnished the ironwork of the central court, and the mosaic flooring is by Messrs. Oppenheim, of Manchester. Messrs. De Groot, Sharp & Emery, of Dublin, have executed some splendid work in stone-carving, and altogether the contracts entrusted to Irish firms have been carried out in the most admirable manner, competing creditably and successfully with the best work of the same kind done in any part of the world.

### ANTIQUE CLOCKS.

AN interesting collection has been bequeathed to the British Museum by Mr. Octavius Morgan, who since 1830 had been a Fellow of the Society of Antiquaries. For fifty years Mr. Morgan continued to increase and improve his collection, which included clocks and sundials as well as watches, and it may fairly claim to illustrate all the varieties of mechanism which many generations of inventive craftsmen have applied to these useful instruments. These are now exhibited with the other objects of the same kind in the Mediæval room. Of the fifty clocks in the collection the most important, as it is the largest and most elaborate, is the complicated instrument made in 1589 by Isaac Habrecht, one of the two ingenious brothers who made the famous clock at Strasburg. Although it is only from 4 to 5 feet in height, and can bear no comparison as to size with its gigantic prototype, yet in detail many of the parts betray the same hand. The general design is the same as that of the left tower of the Strasburg clock, and on the sides of both are figures of the three Fates, Clotho, Lachesis, and Atropos, and both are surmounted by a figure of the cock of St. Peter, which at the stroke of the hour flaps its wings and crows. The quarters are struck by four figures representing the ages of man, and the hour by a figure of Death. On a lower balcony is a seated figure of the Virgin and Child, before whom passes a circle of angels, who, as they are set in movement by the striking of the clock, are caused to make an obeisance in front of the Virgin. Below this the gods of the days of the week perform their circuit, each driving in a chariot, while two dials on the lower stages fulfil the more useful functions of indicating the hour, the phases of the moon, the feasts of the Church, &c. The case is of gilt copper, with well-engraved figures and ornamental designs, perhaps by Tobias Stimmer, who was employed to decorate the original clock at Strasburg. The history of this clever piece of mechanism is somewhat curious, though it rests upon slender foundations. It is stated that Pope Sixtus V. was so pleased with the Strasburg clock that he ordered Habrecht to make one of the same kind. This one was made, and remained at the Vatican for 200 years. Its next appearance was in Holland, where it was in the possession of the King; from Holland it came to London, and was exhibited about 1850. A pamphlet was printed giving a description of the clock, and recounting this somewhat apocryphal history. After some vicissitudes it came into Mr. Morgan's possession a year or two later. Many of the other clocks in

# KALLKOLITH.

## NEW PATENT PRIMING AND STAIN.

Acknowledged by experts of nearly every country to be one of the most important inventions of the Nineteenth Century.

PATENTED IN  
England,  
Belgium,  
France,  
Germany,  
Italy.

PATENTED IN  
Austria-  
Hungary,  
Denmark,  
United  
States  
of America.

**KALLKOLITH** is one of the most marvellous inventions of the present age, and is used as a priming in place of the now almost obsolete oil-colour. It produces an exquisite smoothness, combined with great durability, and amalgamates thoroughly with wood, iron, cement, stone, plastering, &c.

**CHEAPNESS.**—It saves at least 100 per cent. in comparison with any other priming now in use, being less than half the weight.

**ECONOMY** is manifested by the fact that one 14-lb. tin of **KALLKOLITH** goes further than three times the same quantity of oil-colour.

**DRYING POWERS.**—It dries within one to two hours, thereby greatly facilitating the quick dispatch of labour.

**DURABILITY.**—Where **KALLKOLITH** is used it imparts an amount of durability to all oil-colours used upon it which has never yet been obtained, and one of the most important advantages in its use is that the paint put upon it does not blister.

**PAPER-HANGING.**—Walls prepared with **KALLKOLITH**, thinned with seven parts of water, give a great additional advantage to the hanging of all descriptions of papers.

### TESTIMONIALS.

21 New Bridge Street, London, E.C.: February 23, 1886.  
I have had some trials made with the **KALLKOLITH** during the past few weeks, the results of which are very satisfactory. The **KALLKOLITH** is to be used as the first coat of paint on wood and other substances, and is of such a nature that the ordinary work in preparing for paint is considerably lessened, and the usual number of coats now given reduced, and, once fairly introduced in the market, I am certain there will be a large sale.  
J. WM. STEVENS, Architect and Surveyor.

75 Newman Street, Oxford Street, W.: Feb. 15, 1887.  
We are pleased to tell you that the **KALLKOLITH** supplied to us has been fairly tried, and we find that it answers all that you claim for it.  
CAMPBELL, SMITH & CO.

Price per case of 8 Tins of 14 lbs. each, net 40s., packing included. Special terms to Wholesale Buyers and Shippers.

Address—**KALLKOLITH CO., 175 STRAND, LONDON, W.C.**

the collection are of unusual merit, and illustrate the endless variety of design which characterises this branch of industry. Mr. Morgan paid considerable attention to the mechanism of clocks and watches, and he gave an account of his discoveries in this direction in the "Archæologia" for 1848. The outer cases, both of the clocks and the watches, are often deserving of as much attention as the internal mechanism. The common form of the sixteenth century—a square tower of metal, closed on all four sides—admitted of the most lavish decoration, and much of the work is of quite as high a quality as the silversmith's work of the same time, and, in fact, in some instances proceeded from the same workshops in Augsburg or Nuremberg. The series of sun-dials, which accompanies Mr. Morgan's other collections, forms an interesting addition to those already in the museum—no inconsiderable number. They are for the most part of German manufacture.

### PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Cassell, Consulting Patent Agents, 43 Southampton Buildings, Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

#### APPLICATIONS FOR PATENTS.

13950. Joseph Addey Fawcett, for "A new or improved key, handle, or crutch for taps, valves, vents, spills, &c." September 28, 1888.

14001. William Bradley, for "Improvements in the construction of cocks or taps." September 29, 1888.

14006. James Marshall, for "Improved bow or swinging crescent, for automatically operating crane buckets." Sept. 29, 1888.

14014. William de Lacy-Perry, for "A simplex burglar-resisting window-fastening." September 29, 1888.

14069. James More, for "Improvements in the construction of fire-extinguishing apparatus, and in vessels for generating and retaining carbonic acid gas." October 1, 1888.

14119. Francis Elliott Stuart, for "Saving life from fire, the domestic fire-escape." October 1, 1888.

14137. Thomas E. Bickle, for "A safety-catch for lifts, hoists, cages, skips, &c." October 2, 1888.

14138. Henry Vincent White for "Repairing and forming the surface of roads and streets for a permanent way." October 2, 1888.

14146. Francis Joseph James Gibbons, for "An improvement in espagnolette bolts for fastening casements, applicable also to other analogous purposes." October 2, 1888.

14156. William Young Hardie, for "Improvements in the precipitation and the mechanical, chemical, pneumatic, and electric treatment of town sewage and the utilisation of the solids therein, as well as the preparing from town refuse a deodorising and purifying powder, which is also applicable for other purposes." October 2, 1888.

14158. David Clohesy, for "Undercutting or dovetailing in any size wood, stone, iron, steel, or any other substance into which another is required to be let, fastened, or permanently inserted." October 2, 1888.

14159. Norris Rhodes Epworth, for "Improvements in the construction of shop-fronts." (Complete specification.) October 2, 1888.

14179. James George Killey, for "An apparatus for inspecting the interiors of pipe-sewers, &c." October 2, 1888.

14262. James Reid, John Peacock, and Duncan Walker, for "Improvements in and relating to the valves and valve-fittings of baths, sinks, lavatory basins, and the like." October 4, 1888.

14286. John W. Ransome, for "Improvements in the manufacture of artificial stone and concrete blocks." October 4, 1888.

14293. Emma Osborne, for "Automatic household fire-escape steps and ladders." October 4, 1888.

#### PROVISIONAL SPECIFICATIONS ACCEPTED.

11250. Thomas Carpenter Dowd, for "Improvements in casement-fasteners and lift-catches." August 3, 1888.

11466. Charles Southon, jun., for "An improved chimney-cowl." October 8, 1888.

12408. John R. B. Rashleigh, for "Improvements in means or devices for facilitating the insertion of nails, screws, and other fastenings into brickwork, concrete, or other masonry, and for insuring the retention of same therein." August 28, 1888.

12675. Ferdinand Dick Butler, for "An elevating table or hoist, applicable also as a builder's or decorator's scaffolding or the like." September 3, 1888.

## Wilson's Patent Dioptrical Pavement Lights.

WILSON & CO. beg to call the attention of Architects and others to the superiority of Wilson's Patent Dioptrical Lenses for pavement and floor lights. These Lenses are constructed on strictly scientific principles, and have been approved by some of the highest authorities on Light. They are made of the Best English White Flint Glass of high refractive power, and transmit more light than any other form of Lens yet introduced. The reflecting surface being spherical, the rays of light are distributed in every direction.

Wilson's  
Patent Lenses  
for  
Floor Lights,  
Deck Lights,  
and  
Pavement  
Lights  
of every  
description.  
Sample Lenses  
on  
application.

Wilson's  
Patent Lenses  
for  
Stall Boards,  
Cellar Flaps,  
Ornamental  
Tile & Glass  
Pavements.  
Safety Coal-  
Plates.  
Plans, Prices  
and Estimates  
Free.

Fig. 1 shows how the ordinary prism or semi-prism, by receiving the rays on a plane reflecting surface, throws them forward at one angle only, in parallel lines close to the ceiling.

Fig. 2 represents the Patent Dioptrical Lens, and shows by comparison how the rays of light, striking on the curved inner surface, are reflected forward through the face of the lens in every direction, filling the whole angle of 90°, thus illuminating the apartment from floor to ceiling and from wall to wall.

From the above diagram it will be seen wherein consists the advantages claimed for Wilson's Patent Lenses. The objection to the semi-prism is that it reflects the light, as shown in Fig. 1, at such an angle as to be of little use, and more especially if the line of the ceiling is below the line of the pavement; then the value of the semi-prism as a light projector is entirely lost.

It will be seen also, on reference to the above diagrams, in Fig. 1 that the first row of semi-prisms obstructs the rays of light from each succeeding row, whereas in Fig. 2 the bulk of the rays of light are projected at such angles as to pass unobstructed into the room.

The correctness of these illustrations can be practically demonstrated to any architect desirous of testing them.

PRICE LISTS AND ESTIMATES ON APPLICATION TO

WILSON & CO., Bridge House, 181 Queen Victoria Street, London, E.C.

12676. De Fonblanque Pennefather, for "Improvements in apparatus for ventilating rooms, chambers, buildings, and the like." September 3, 1888.

12701. Oliver Imray, for "An appliance to window-sashes to prevent shake." September 3, 1888.

12729. George Heinrich Otto Böklen, for "Improvements in metallic roofing." September 4, 1888.

13096. John Edward Rogers, for "Improvements in flushing cisterns or waste water preventers." September 11, 1888.

13185. James King, for "Improvements in the construction of metal cisterns, tanks, and other such vessels." September 12, 1888.

13432. John M. Siddell, for "Improvements in filling, or devices to be used in connection with outside blinds for shop windows and for analogous purposes." September 17, 1888.

#### COMPLETE SPECIFICATIONS ACCEPTED.

Notice is hereby given, that all persons interested in opposing the grant of a patent on any one of the undermentioned applications may, at any time within two months from the date of the official *Journal*, give notice at the Patent Office in the prescribed form of such opposition.

14068. Jonathan Hurn Faulkner, for "Improvements in mechanism for allowing locks, more particularly those of gates or doors, to be operated on the insertion of coins, and for securing, when applied to waterclosets, the closing of the door after each payment; also applicable to automatic sale apparatus and the like." October 17, 1887.

15996. William R. Lake, for "Improvements in devices for preventing the slamming of doors." (Henry E. Russell, United States.) November 21, 1887.

16262. Francis Napier Seyde, for "Improvements in metallic lathing or backing for plaster or cement partitions and ceilings." November 26, 1887.

16375. Alfred Dongill, for "Improvements in baths or combined hot-water tank or cistern and bath." November 29, 1887.

16507. Frederick Howard Collins, for "Improved indicator for door fastenings." December 1, 1887.

574. William Joseph Balk, for "Improvements in street gullies and traps." January 13, 1888.

3197. William Morier, for "An improvement in the manufacture of whitewash and distemper brushes." March 2, 1888.

10706. George Evans, for "Improvements in construction of window frames and hanging the sashes." July 24, 1888.

#### PATENTS SEALED, OCTOBER 5, 1888.

11044. Benjamin Waldron, for "Improvements in boxes for stopcocks and other analogous purposes." August 12, 1887.

12362. Proctor Barrett, for "Improvements in means applicable for the counterbalancing of window sashes." September 13, 1887.

12872. Mark Henry Blanchard, for "Improvements in bricks for wells and such like purposes." September 22, 1887.

8245. George Anslow, for "Improvements in locks and latches for house doors." June 6, 1888.

#### ABRIDGMENTS.

"Certain improvements in spring catches for doors, &c." No. 14776. 1887. S. Timmins & S. Hill, 23 Great Hampton Street, Birmingham.

*Claim I.*—Making the bolts of spring catches or fasteners for doors, gates, French windows, or the like capable of an outward swinging motion as described, in combination with the usual sliding motion, so that the bolt will automatically pull the door, &c., into its closed position after it has been opened through a short space, substantially as set forth.

"Improvements in the manufacture of blue bricks, tiles, and fire-bricks, and the like." No. 17967. 1887. Benj. Gregory, Carlton Hill, Carlton, Notts.

*Claim I.*—The use of iron ore to blue the blue bricks, tiles, and the like.

*Claim II.*—To make the blue bricks, tiles, and fire-bricks without using "blue clay" or "fire brick."

"Improvements in arrangements and apparatus for ventilating halls, &c." No. 5931. 1888. D. J. Hoey, 196 St. Vincent Street, Glasgow.

*Claim I.*—In arrangements or apparatus for ventilating halls, rooms, &c., providing dado spaces or equivalent reservoirs with tops, wire gauze, or perforated sheet metal, and with several inlets for the purpose of distributing the entering air over a considerable extent of space along the walls, as hereinbefore described.

TO INVENTORS.—Patents for Inventions, Trade-marks, and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CASSELL, Patent Agents, 43 Southampton Buildings, Chancery Lane.

# THE "THOMAS" LAMP.

Lighting Power with  
ordinary London Sixteen-  
Candle Gas, from tests  
taken by Professor Wm.  
Foster, M.A., L.R.C.S.

No.		
10.	11.4	Candle-power per foot.
11.	12.5	" "
12.	12.5	" "

These Lamps are made in three  
sizes, Nos. 10, 11, 12.

These Lamps can be obtained through Gasfitters, Ironmongers and  
Merchants. Foreign Orders through Merchants only.

The advantages of this Patent  
over other existing Lamps  
are:—

Small consumption of Gas  
with great Illuminating power.

No possibility of the Burner  
corroding or getting out of  
order, as is the case with other  
generative gas lamps.

The Lamp can be fitted by  
any gasfitter. No fine per-  
forated metal, gauze, or other  
obstructions are used in this  
Patent, as in other lamps which  
are liable to become choked  
through imperfect combustion,  
rendering the lamps smoky and  
useless.

FOR FURTHER PARTICULARS, APPLY TO

**Ridsdale's Railway Lamp & Lighting Company, Ltd.,**  
**55 & 56 MINORIES, LONDON, E.C.**

# The Architect.

## THE WEEK.

MR. THOMSON offered an opportune suggestion at the meeting of the Glasgow Institute of Architects on Tuesday when he proposed that a part of the surplus of the Glasgow Exhibition should be assigned for founding a chair of architecture in the Glasgow University. When he said that the success of the exhibition was in a great measure owing to the building, Mr. THOMSON was expressing a general belief; but, on the other hand, the authorities may point out that the designer of the building, the late JAMES SELLARS, was not taught in a university, and we believe at no time was he a pupil in an architect's office. He attained his skill in design and knowledge of ornament in the local art school, and it may be said that the same route is open to every youngster. Although Glasgow has not a professor of architecture, it is not lacking in able architects. However, benefits would follow from the establishment of a chair of architecture to others besides professional students, and the executive will do well to consider Mr. THOMSON's suggestion. One of the most interesting items in the report read at the meeting related to the travelling studentship, which was awarded in last December to Mr. W. J. ANDERSON. The Council say that Mr. ANDERSON, in fulfilment of the conditions of competition, made a sketching tour in the spring and early summer of the year, and spent fully twelve months in Italy. On his return he submitted the sketches and drawings which he had made, together with a memoir descriptive of his travels. The trustees had every reason to be satisfied with the competition and its results. At the election which followed the meeting Mr. GORDON was elected President and Mr. LEIPER Vice-President.

THE list of subjects for papers issued by the Institution of Civil Engineers suggests the widening of the profession. Not satisfied with what has been done already, the first subject proposed is "The Utilisation of Unused Sources of Power in Nature." New powers suggest new causes of mischief, and, accordingly, the third subject proposed is "The Influence of Sea Water upon Portland Cement, Mortar, and Concrete," which will allow of an opportunity to discuss the difficulties which have of late put the harbour authorities in Aberdeen to much expense. Another subject which is useful is "Standard Specifications for the Materials Used in the Construction of Engineering Works;" a paper on it may lead to uniformity of practice. Uniformity is no less needed in architectural specifications, but apparently a century will elapse before the Institution is awakened to recognise the importance of subjects relating to practice. The Council of the Institution also propose an investigation of "The Working Strength of Iron and Steel as affected by the amplitude, the frequency, and the time-rate of the stress variations," thus indicating that our knowledge of the strength of beams is not complete. Another subject which relates to architects is the one described as "The Effect of Wind upon Structures, as influenced by their superficial area; the form or position of the exposed surfaces; the shelter of adjacent bodies; and the dynamic action of sudden gusts." They have also an interest in the thirty-seventh subject, which is "The best combined System of Warming, Ventilating, and Lighting Large Buildings." It does not follow that the only use of the suggestions for papers is for members who intend to work upon the subjects. The list awakens thought, and enables many to recall all they know about a subject, and to discover how much they have to learn.

THE Special Committee on the work of the Works Department of the London School Board have an onerous task before them, if they consider all the allegations which are brought forward. For instance, one letter-writer says he can show how a surveyor of the School Board invariably received three payments upon the large amounts

included in the estimates as provisional sums. This operation, it appears, was conducted by the following strategy:—1st. His commission included a percentage upon provisional accounts, and was paid from the first instalment received by the contractor. 2nd. When adjusting the accounts, a deduction was made of all the provisions and  $2\frac{1}{2}$  per cent. was claimed upon the deduction. 3rd. Another charge was made upon the net amount expended out of the provisions. In this way the surveyor is said to have netted 50 per cent. more than other surveyors. It is also charged against him that, instead of taking out his quantities, he let them on the sweating system. It is easy enough to make rash statements like the foregoing at a safe distance, but it is hardly probable that the author of the indictment will have the courage to appear and uphold his words.

THE Edinburgh Town Council have introduced the plan of dealing with sculptors as if they were architects. It appears that Prince's Street is to be adorned by statues of WALLACE and BRUCE, which are to be 14 feet in height, standing on pedestals 15 feet high. Sculptors are accordingly invited to send in models of the figures 3 feet 6 inches high, or one-fourth the scale of the contemplated statues. The prizes are to range from 20*l.* to 5*l.* It is stipulated that the statues and pedestals are to be supplied and erected for the sum of 2,750*l.*, and that the bronze is to be not less than  $\frac{3}{8}$  inch thick at the thinnest part. Here is what a competitor says of the bargain:—"It is found that the bronze casting by a good firm will cost 1,400*l.* for the statues. The pedestals will cost about 600*l.*; the foundation say 100*l.*, but as the ground is forced one may drop several times that amount in the hole; framework material and casting in plaster for the models, 150*l.*; transits and cases, 100*l.*; rent and taxes, 100*l.*; assistance and incidental expenses, say 100*l.* These are close figures of certain expenditure, which may easily be exceeded, and the total is 2,550*l.*, leaving a balance of 200*l.* for the artistic work and the full-size 14 feet models, and the risk, care, and attention of the work for a period of at least eighteen months." We trust the northern sculptors will have the shrewdness to investigate the subject before they enter on the competition. It is true that some of the items appear rather high, such as 600*l.* for two pedestals, but enough remains to reveal the hard conditions offered by the Council.

THE jury appointed to examine the second series of designs submitted in the competition for the façade of Milan Cathedral have awarded the first prize of 40,000 francs to M. BRENTANO, of Milan, who is to be entrusted with the execution of the works. Prizes of 5,000 francs each are obtained by Messrs. DEPERTHES, of Paris; BELTRAMI, of Milan; and NORDIO, of Trieste. The winners of 3,000 francs are Messrs. DICK, of Vienna; WEBER, of Vienna; MORETTI, of Milan; and LOCATI, of Milan. The prizes of 2,000 francs are given to Messrs. DAVID BRADE, of Kendal; BECKER, of Mayence; HARTEL ET NECKELMANN, of Leipzig; CESA BIANCHI, of Milan; AZZOLINI, of Bologna; and FERRARIO, of Milan.

M. FEYEN-PERRIN, who died a few days ago, was one of the painters who most felt the influence of MILLET. He did not attempt to impart the sadness of MILLET to all his works, but he tried to suggest that he possessed equal sympathy for labourers. Like MILLET, he was a pupil of DELAROCHE, and began with historical painting, but the success of his *Grève* and *Vanneuse* revealed to him his true powers. Of the latter work he made several replicas. He was one of the painters who were attracted to the shores of France, and the Government showed discrimination when his *Retour de la pêche aux huîtres* was selected for the Luxembourg. He was an excellent portraitist. At one time M. FEYEN-PERRIN was wealthy, but he lost all his savings through an unwise speculation. His school in Paris was much frequented by ladies.

## THE HOLY PLACES OF JERUSALEM.\*

IT is not difficult to understand the reasons for the uncertainty of our knowledge about the ancient topography of Jerusalem and the positions of the Holy Places. If the old landmarks were forgotten it was owing as much to the progress of Christianity as to the destruction of the city under TITUS.

As Christianity had its origin in Jerusalem, it might be supposed by one of the early disciples that the city was to become a veritable "centre of the world," and that the visions of the prophets were to be realised in the multitudes of strangers from the ends of the earth who were to enter through its gates. We may imagine that many among the first converts to Christianity were sorely tried in their faith when they discovered that Jerusalem was overthrown. If the statement of TACITUS can be accepted as credible, one of the objects sought by TITUS in the demolition of the temple was to give a final blow to Christianity as well as to Judaism. It was not supposed that either of the sects could survive when it was found that no battalions from above came to resist the Romans. The story seems confirmed by an historian of the second century, who describes the efforts of TITUS to dispel the terrors of the soldiers who were ordered to enter the temple. The thoroughness of his destruction, indeed, suggests that TITUS was thinking of other enemies besides those in the city. When he left Jerusalem it was a heap of ruins, over which the tenth legion was placed in order to prevent all attempts at rebuilding by Jews from distant regions. Under the circumstances, there was no likelihood that any care would be taken to preserve a record of the places which were hallowed by the sufferings of CHRIST.

During the period which followed there were influences at work through which Jerusalem lost all claim to the supremacy which appeared to belong to it. M. RENAN, when lecturing in London, argued that, if the Temple of Jerusalem had survived, the development of Christianity must have been arrested; it would be recognised as the holiest spot in the world, and whoever presided in it would hold the highest place in the Church. It is maintained, however, that under those conditions the ritual of Judaism was destined to prevail, and with it a hierarchy composed of one family. In the course of events the Church of Jerusalem declined, and more than a century appears to have elapsed in which there is no trace of a pilgrim from Europe to the city.

After CONSTANTINE had given freedom to the Christians of the empire, there was evidently a desire to take part in pilgrimages to the Holy City. In A.D. 333 an itinerary was composed for pilgrims (including Britons and Indians) between Bordeaux and Jerusalem. GIBBON relates with a sneer that for the visitors the clergy "fixed by unquestionable tradition the scene of each memorable event." But, to satisfy people of a later age, something more than tradition is sought. Much has been done by the Palestine Exploration Fund in increasing our knowledge of what still exists above and below the soil of Jerusalem; yet in the most important places nothing has been discovered which will enable us to supplant the old traditions by something like certainty. All the exploration has failed hitherto to determine the scene of the Crucifixion. We have no more than a substitution of new guesses for some which have age in their favour.

The interesting book by Mr. HAYTER LEWIS suggests the difficulty of the problem. As becomes an architect, the author does not seek to evade difficulties, or to throw dust in the eyes of his readers. Setting aside legends, he depends upon a close examination of the remains, and where the problem to be determined is one of the age of a building, Mr. HAYTER LEWIS endeavours to discover evidence by a comparison of the work in Jerusalem with what is found elsewhere. It would be vain to say that in every case the writer proves his point, for a good many years must pass before there is an agreement on anything relating to Jerusalem; but every one will recognise his skill in marshalling proofs, and the love of truth which inspires the book.

\* *The Holy Places of Jerusalem.* By T. Hayter Lewis, F.S.A. London: John Murray.

The first question suggested by the volume is the difficulty of determining the lines of the walls of Jerusalem. A plan showing those laid down by various inquirers might be taken as a sample of what follows. FERGUSON'S "first wall" overlaps a great part of the "second wall" of WARREN, CONDER, WILLIAMS, and others; on the Sakhrab, CONDER'S line is outside FERGUSON'S; and the existing wall, which is mainly the "second" of FERGUSON, is the third of WARREN. The lines are of much importance in relation to the position of the Holy Sepulchre and Calvary. Excavations are in progress, and every one is familiar with the sketch of the lofty wall on the cover of the *Quarterly Statement*, which was about 150 feet in height. Mr. HAYTER LEWIS suggests its greatness, by asking us "to imagine a massive wall of stone some 30 feet higher than our Duke of YORK'S column."

The Haram Area, or Noble Sanctuary, which was supported on three sides by the wall, forms the subject of a large part of the book. It was on that site, according to some authorities, the Temple of Jerusalem was erected, and on the spot where the Dome of the Rock, or Mosque of Omar, now stands. The traditions of the Jews correspond with that view. The late Mr. FERGUSON maintained that the building was the Church of the Holy Sepulchre, erected by CONSTANTINE, and that the scene of the Crucifixion was about 150 yards from the north-west angle of the building. According to Mr. FERGUSON, the building is essentially a tomb-house, and in beauty surpasses similar works between Rome and Delhi. It could not be a mosque, he said, as the chief entrance is on the south, and the worshipper would have to turn his back on Mecca. The dome is admittedly Mohammedan, but the ceilings of the side aisles are Roman, and, architecturally, says Mr. FERGUSON, the building belongs to the age of CONSTANTINE.

Mr. HAYTER LEWIS takes up all Mr. FERGUSON'S statements in turn and refutes them. In the first place it is shown that the building is not a mosque, but "an oratory built over the Rock to protect the pilgrims who prayed there," and is comparable with the Dome of the Books in the Damascus mosque or the fountain in the mosque of Amru at Cairo. It is suggested that the existing solid walls of the octagon did not form part of the original design, and, in that case, the building would consist of two arched open colonnades. This arrangement is suggested by a description of the ninth century, which speaks of the structure as hung round with curtains of brocade. It is supposed by Dr. CHAPLIN that the Arabs did not anticipate so much coldness in Jerusalem, or the drifting of the snow into the shrine, and the wall was made as a protection. Mr. HAYTER LEWIS considers the subject of the details of the capitals and columns, and shows how they "were reconstructions of older buildings of various dates which had been partially destroyed, and whose materials had been put together in after times, together with others worked at the time by a skilful architect." The sketches of the capitals indicate a free interpretation of Corinthian or Composite, but there is, it appears, much bad carving among them. There seems to be little doubt about Mr. HAYTER LEWIS'S conclusions; and, if so, what are we to say about the infallibility of Mr. JAMES FERGUSON when we find him saying:—"There is no proposition connected with the topography of Jerusalem, to my mind, so clear and indisputable as that the buildings, popularly known as the Mosque of Omar—more correctly as the Dome of the Rock—and the Golden Gateway, are two of those described by EUSEBIUS as being erected by CONSTANTINE in honour of the death and resurrection of the founder of the Christian religion." It would be well if this were the only instance of an excess of confidence which Mr. FERGUSON displayed.

Mr. HAYTER LEWIS next considers whether the building from which the columns were taken belonged to CONSTANTINE'S time. After comparing drawings of them with examples in Syria, Rome, Spalato and Constantinople, he believes that "the capitals of the columns are in general executed in a style which is more debased than in any known example of CONSTANTINE'S time; the greater number, at least, of these columns must have belonged to buildings erected after his time, then ruined and re-erected at the Dome of the Rock. The columns are surmounted by dosserets, a peculiar form not known to have been used elsewhere until the sixth century."

The theory of Professor SEPP, who assigns the whole of the work of the Dome of the Rock to the Emperor JUSTINIAN, is next set aside by Mr. HAYTER LEWIS, but, as in the case of Mr. FERGUSON, with a gentleness which is not common in controversies on an archaeological or architectural subject. His own belief is "that the Dome of the Rock was the work of Arabs, designed for them by a Byzantine or Persian architect, and with Persian or Byzantine workmen, before the Arabs had developed any style of their own, and that it was built with the capitals, bases and columns ready to hand, being derived from the remains of churches and other buildings destroyed by CHOSROES and other invaders." It is to be hoped that this conclusion will settle the question.

A chapter is devoted by Mr. HAYTER LEWIS to the Mosque El Aska, which by some writers has been described as the great church erected by JUSTINIAN, and dedicated to the Blessed Virgin. But neither the style of the work nor the records will support that theory. The building was occupied by the Knights Templars for a time, but that appears to be its only connection with Christianity, unless we suppose that some of the materials were taken from St. Mary's Church.

The Golden Gate has nothing in common with the structure which RAPHAEL introduced in one of his cartoons. It is difficult to realise its original appearance, as the ends are blocked up; but Mr. HAYTER LEWIS says, when "seen through its length, the effect of the open double archway, with its light streaming through it at its ends, and leaving the centre part in shadow, must have been charming." He considers it to be a work of the time of JUSTINIAN.

The buildings belonging to the Church of the Sepulchre are described, and a reduction of the Ordnance plan is given. Mr. HAYTER LEWIS says the subject is a favourite with him, and he goes at great length into what he believes was the history of the building. He differs from the scheme of the original arrangement proposed by Professor WALLIS, and the plan in the book shows a much larger building as CONSTANTINE'S.

The final chapters are on Jeremiah's Grotto, which is by some writers taken as being near the place of the Crucifixion (Bishop GOBAT supposed the site to be more to the east), and on the Pool of Siloam.

There are, it will be seen, several most interesting questions discussed in this volume, but although mainly architectural, they will also be found attractive by biblica students. The illustrations are from surveys and photographs, and can be accepted as accurate.

#### WORKING IN GLASS.\*

By AUGUSTUS W. FRANKS.

THE Egyptians, if not the inventors of making glass, were great workers in that substance, and applied a vitreous coating to pottery, and even stone. The Egyptian specimens in the Slade collection are not so numerous as those in the Egyptian collection, but include an elegant vase in the form of a papyrus sceptre, made for holding the antimony or *stibium* to be applied to the eyelids, and a very remarkable amulet with the prenomen of Nuantef IV., a monarch of the eleventh dynasty, placed by Lepsius between B.C. 2423 and 2380. The glassworks of Egypt must have been in full operation under the Ptolemies; and during the Roman dominion they produced very elaborate specimens, especially some minute mosaic patterns, of which there are good examples. These were made by arranging in the required patterns a number of slender rods of glass of various colours, fusing them together, and then drawing them out, so as to reduce the whole uniformly; transverse sections of the rod thus obtained would each exhibit the same pattern. To the Phœnicians may in all probability be referred the numerous little vases of brilliant colours which are found in tombs throughout the borders of the Mediterranean. They exhibit everywhere the same technical peculiarities, and as they differ somewhat in form and make from unquestionably Egyptian specimens, it is probable that they are the products of the only other great centre of glassmaking, the celebrated works at Sidon. The forms are more Greek than Egyptian, frequently *alabastra*, *amphora*, and *praefericula*. The colouring is striking, generally in zigzag patterns of yellow, turquoise, or white, relieved by blue, brown, or green grounds. There are many fine vases of this kind in the collection, as well as one of the gold stands made to support them. To a later

period of the Sidonian workshops may probably be referred a number of small bottles of various forms, blown in moulds, and which have been chiefly found in Syria and the neighbouring islands. The specimens are in the shape of dates, grapes, heads, &c. Two of the vessels have on them the names of their makers, Eugenēs and Ennion. Several handles, once forming parts of small cups, are stamped with the name of the maker, Artas the Sidonian, in Greek and Latin letters.

The making of glass at Rome is said to have been introduced by Egyptian workmen, and must have been much practised there, as specimens of Roman glass are very numerous. The material was applied to a great number of uses, and the processes seem to have been quite as varied and well understood as in later times. The common clear glass has generally a greenish or bluish hue, though sometimes it is as white and brilliant as rock crystal; this latter kind was much valued by the Romans; the other transparent colours generally found are various shades of blue, purple, yellow, and green. A delicate pink is supposed to derive its colour from gold. The opaque colours are less commonly employed singly, but they occur in shades of yellow, blue, green, and black. The beautiful iridescence with which many vases are covered is not intentionally produced, but is the effect of time, which has partially decomposed the surface of the glass.

The simpler vases are only blown, with handles, feet, or ornamental fillets subsequently added; others are blown into moulds, and exhibit various designs in relief; some of the bowls have projecting ribs, and have been termed pillar-moulded. On some vessels, chiefly belonging to a late period, shallow engraving, executed on the wheel, has been added; others are cut in regular patterns. Sometimes a coloured ground was coated with white opaque glass, which was afterwards cut away, so as to produce a cameo, as in the celebrated Portland Vase, exhibited in the Ornament Room, and in the Auldjo Vase. In other instances a number of different colours were employed, sometimes, as in the Egyptian specimens above noticed, forming regular mosaic designs, sometimes blended into a mass of scrolls, rosettes, &c., and at others imitating onyx, agate, madrepore marble, or porphyries and other hard stones, though generally in more brilliant colours. Of these designs the variety is inconceivable, as may be seen by several bowls and numerous polished fragments. Occasionally gold-leaf was introduced, and at a late time the insides of cups and shallow bowls were decorated with patterns in gold-leaf, sometimes on the surface, sometimes enclosed between two layers of glass. To this class belong the fragments with Christian designs found in the catacombs of Rome, as well as the remains of a large disc from Cologne, on which, though much broken, eight Christian subjects may be distinguished. The mosaic glass, and especially that imitating various stones, was much used to line the walls, or to form the pavements of rooms. Very clever imitations of gems were made, and the glass intaglios and cameos have preserved to us designs of some of the greatest gem engravers, being generally moulded from gems, and not themselves engraved. After the fall of the Roman empire the glass works of the West must have gone to decay. In the East glassmaking was still continued, probably in the neighbourhood of Damascus. There are in the collection some very fine specimens, all decorated with enamel and gilding, including six mosque lamps of the fourteenth century, and two bottles with elaborate ornaments, as well as a number of Persian and Chinese specimens.

The oldest known specimens of Venetian glass are of the fourteenth century. The earlier examples seem to have the forms of silver plate, and are frequently massive and richly gilt and enamelled. One of the largest examples in the collection is a covered standing cup, with gilt ribs. Two of the earliest, and also most elaborate specimens, are a green goblet with portraits, and a blue cup with a triumph of Venus. The vases of brown glass are frequently very elegant, especially those in uncoloured glass; the stems are very often decorated with knots, and wings, and other fantastic additions in blue glass. Vases were also made entirely or partially of coloured glass, generally blue, purple, or green; sometimes a milky opalescent colour was produced, due, it is said, to arsenic; also an opaque white, derived probably from tin, which is further diversified with splashes of other colours. Another kind of variegated glass, which was called *calcedonio*, exhibits the streaky hues of the onyx, and was occasionally sprinkled with aventurine spots. Great use was also made by the Venetians of rods of glass enclosing threads of opaque white glass (*laticinio*), arranged in various patterns. Thus was produced the elegant lace glass (*vitro di trina*), in which Venice was unrivalled. Another variety (*à reticelli*) is ornamented with a network of opaque white lines, enclosing at the intersections bubbles of air. A goblet of this kind has in the foot a half sequin of Francesco Molino, Doge of Venice in 1647, marking the period at which it was made. The opaque white decoration is sometimes applied in parallel lines, sometimes in a wavy pattern, and exhibits endless variety. The Venetians were great makers of beads, with which, for many centuries, they supplied the world,

\* From the new Guide to the British Museum.

These were very often formed from sections of rods, with mosaic designs. Such sections were also sometimes worked up into vases (as by the ancient Romans), thence termed *vasefiori*. Of these there are good examples in the collection.

In France, glassmaking was long practised, but it is difficult to distinguish the productions of that country. A remarkable goblet has on it the names of Jean and Antoinette Boucicault, as well as their figures and device in enamel. It was probably made about 1530. The earliest dated specimen from Germany in the collection is of the year 1571; it is a large cylindrical cup (*Wiederkom*) with the imperial eagle, bearing on its wings the arms of the states, towns, &c., composing the German Empire. The German specimens are heavy in form, and often richly enamelled with heraldic devices and figures. Some specimens are painted in grisaille or colours, like window glass; such is a goblet dated 1662, on which is represented a procession in honour of the birth of Maximilian Emanuel, afterwards Elector of Bavaria. The engraved specimens are well executed, one of them is signed Herman Schwinger of Nurnberg. The ruby glass for which Germany was renowned is said to have been invented by Kunckel. In Flanders, glass seems to have been made in early times. In the sixteenth century many glass vessels (whether of native make or not is uncertain) were etched with various designs. Some of the specimens in the collection have portraits of historical personages, such as Philip IV., king of Spain, William II. of Orange, his wife Mary of England, Olden Barnevelt, and others. At a later time a delicate etching in dots was introduced; of this there are specimens signed by F. Greenwood, and several attributed to Wolf. Some of the Dutch engraved goblets are well designed, and show much richness of pattern. The earlier Spanish examples resemble closely the Venetian; the later are coarse and of no great technical merit. Drinking-glasses seem to have been made in England in the sixteenth century, the manufacture having been apparently then introduced by foreigners into Sussex and Surrey. Later, there were works in and near London, and the glassworks of Bristol attained some reputation. Of these last some characteristic specimens are in the collection, which is not, however, very rich in examples of English glass.

#### TECHNICAL EDUCATION.

ON the occasion of the opening of the Dundee Technical Institute, on Monday, an establishment that owes its existence to the liberality of the late Sir David Baxter, an address was given by Mr. Swire Smith. In the course of his remarks, after referring to the Royal Commission on Technical Instruction, he said:—"The English people—or at least, next to the Americans—are the largest buyers in the world; they have the most money, and the greatest amount of leisure in which to spend it. What is the consequence of all this? Our people, and particularly the ladies, are becoming more and more highly educated in matters of taste, and, as they are able to indulge their preferences, the time has literally come when, in dress at least, it may be said that 'the toe of the peasant touches the heel of the courtier.' Let me turn for a moment to the factories and other works visited by the Technical Commissioners, in which the superior goods so largely exported to the United Kingdom were being made. With the evidence before us, we were compelled to come to the conclusion that the import to this country of the overwhelming proportion of what may be called finished products is due neither to the low wages nor the long hours of our rivals, but to theoretical and practical instruction in science and art obtained in schools and applied to manufactures. How comes it to pass that there is a lessened demand for British plain goods on the Continent than in years gone by? This is caused mainly by the determination of Governments all over the world to render themselves independent of foreign imports. We must make up our minds to the fact that the manufacturing countries under protection are manufacturing for themselves the goods which they previously obtained from England, and that never again shall we supply to them the staple products of their consumption. But with increasing wealth there will be a growing demand in every country for novelties and artistic productions, and, whether we like it or not, if we are to keep our people employed and pay for the foreign food and raw materials which in such prodigious quantities we annually buy, we shall be compelled to cater more and more for the superior and attractive things which the people everywhere demand."

Having given some statistics, that in our imports and exports to neutral markets we had more to fear from foreign skill and taste than from foreign cheapness, Mr. Swire Smith continued:—"For my part, I have the greatest objection to the foreigner, because of his science taking the bread and butter out of the mouths of our own hungry people; but we shall have to submit to this folly of buying the product of the scientific skill of the German until we train the scientific

skill of the Englishman, the Scotchman, and the Irishman. Until, by connecting this Institution with University College, Sir David Baxter's trustees secured such a union of educational forces as should render possible the organisation of a complete scheme of instruction in science for the mechanics and craftsmen of the town, it may well have appeared to many that one thing was lacking still. I confidently anticipate that before long all classes of the community will unite in recognising the benefits which will flow from this union to those whom Sir David intended to benefit, and in commending the wise foresight which designed and carried it into effect. You have now in the union of the two Institutions an agency which unites science and art with practice, which supplies effective means whereby the workmen, foremen, and employers, or the young men from whose ranks these leaders and directors in industrial enterprises spring, can, for example, apply their chemical knowledge to dyeing, bleaching, or other operations having a chemical basis, their artistic and designing faculties to the pattern paper and the loom, and their problems in engineering and mechanics to the practical applications of the physical laboratory and the workshop. Without these or some other efficient means of enabling you on the one hand to carry science and art to the workshop and factory, and on the other to bring your workshop and factory difficulties to the laboratory, the designing studio, or the technical classroom, you would still have remained greatly inferior in equipment to those foreign manufacturers of whose competition I have given you such formidable examples. Happily, through the generosity of the late Sir David Baxter and the wise arrangements of his trustees to meet the altered educational conditions of the town, a completely graded scheme of scientific and technical education is now made possible, and Dundee is to be congratulated to-day upon the exceptionally superior equipment which you now possess for developing to the fullest capacity the intellectual resources, not of one class, but of all classes of your people.

"In the Continental towns, which are so lavishly supplied with educational institutions such as you now possess in Dundee, the expenditure is met in nearly every instance which I remember entirely from the rates and taxes compulsorily levied upon all classes according to their means and property. Our great country can boast of illustrious benefactors who, by their noble sacrifices for the welfare of others, have practically relieved some of our most fortunate communities of many of their responsibilities. As to the furnishing of your Institute, especially the textile department, I cannot point to you any Continental models for your exact imitation, but nothing is more easy for you than to profit by the experience of such schools as Bradford, Leeds, and Manchester. In Dundee you are mainly engaged in the spinning and weaving of jute and flax, but there is no reason why your students should not have facilities afforded them of studying the manipulation of other fibres with which you are less familiar, and if new branches of textile industries should thereby be introduced into your district, so much the better for your population. A variety of manufactures tends to give stability to a town, not only by extending the demand for labour, but as affording a natural protection against periods of depression which sometimes visit with exceptional severity those centres which rely mainly on one branch of industry. The object of your technical institute should not be to teach trades, but rather to impart instruction in the principles underlying trades. Regarding your textile department, I will undertake to say that there is no deficiency in the knowledge of plain weaving in Dundee. What you are more likely to be deficient in is in the manufacture of saleable fancy goods. Your weaving department should be first and foremost a school of design applied to weaving. In its main essentials the great utility of the school will turn upon the influence which it may exercise upon the production of artistic and novel designs and their application on commercial lines to the loom. And so if we may consider that if the chief aim of your weaving department will be to cultivate the application of designs to textile patterns, so the pure chemistry, which is being taught so efficiently in the splendid laboratory of the University College, will now be applied to dyeing, printing, bleaching, or to any other local industry in which such chemical knowledge is required. It is impossible for me to do justice to the wise arrangement which secures to the students of your Institute the advantages of the chemical, physical, and other appliances connected with the University College, with their splendid apparatus, models, and machinery; but it is quite evident that in these departments the greatest facilities will be afforded for the practical application of science in its varied forms to the many problems affecting your local industries, which cannot be solved in the workshops alone. I find that there is an impression among some of your business men that a technical school can do very little for Dundee, because your jute and linen trades are what are called 'plain trades,' and that the great bulk of your goods are not affected by fancy designing. There is no reason why you should be bound down eternally to the plain trades, and it appears that Sir David

Baxter's trustees are determined, if possible, to lift some small proportion, it may be of your jute and flax trades, out of the ruts, so that new developments may be attempted, and that Dundee shall be able to hold its own against any town or country in the manufacture of such goods as are wanted, not only in cheapness, but in quality and design."

### ART MUSEUM AT THE EDINBURGH UNIVERSITY.

THE room under the new dome of the Edinburgh University has very appropriately, the *Scotsman* says, been handed over to the Professor of Fine Arts, who has converted it into a museum, small but admirably arranged, of comparative sculpture. Circular in form, the room is 30 feet across and about 20 feet high. It is lighted on what may be called its four sides by large three-light windows, from any one of which a splendid view of the city and its surroundings can be obtained. The walls, lined with wood, are painted a flat Indian red. The frieze is in terra-cotta, the cornice in green-yellow, and the ceiling in grey-green. The warm tone of the room affords a pleasing relief to the sculpture it contains.

Round the walls of the Museum is carried a continuous shelf, and on it is arranged a small, well-selected collection of casts chronologically arranged, so as to illustrate the chief variations of Greek sculpture. On the walls above are photographs, chromos, and drawings of representative pieces of statuary, affording a glimpse of some of the other important forms of Greek and Roman art, while on a table in the centre are reproductions of bronzes, and of small terra-cottas chiefly recovered from the tombs of Tanagra in Boeotia.

Just on the left of the doorway is placed a small Egyptian portrait bust, dating from at least 3,000 years B.C., and beside it are specimens of Egyptian and Assyrian relief, included among the latter being a fragment from the palace walls of Assur-banipal, on which is sculptured a representation of that puissant king killing a lion, his armour-bearer being behind him with bows and arrows. The Oriental influence which was exhibited in early Greek sculpture is shown in a series of reliefs—one being a cast of a bronze panel from Olympia with eastern designs in repoussé work. In contrast to this we see in a small relief the earliest rude attempts at purely native art—the marble exhibiting clear traces of the earlier technique of the carvers of wooden statues. In this connection may be mentioned a fragment of the earliest extant pediment composition from the Treasury of the Megarians at Olympia, which belongs to the sixth century B.C. The ripe Archaic style, with all its decision and severity, is represented by casts of heads from the *Ægina Marbles* at Munich, their date being probably about 470 B.C., while the transition from Archaic to perfect art is illustrated by a head from the metopes of the Parthenon, on which was sculptured in high relief the contest between the Centaurs and Lapithæ—a favourite legend with Greek artists.

Following on some specimens of the ruder sculpture from the Temple of Zeus at Olympia, there are specimens of Pheidian work from the pediments and frieze of the Parthenon, including a fragment of the torso of Poseidon from the centre of the western pediment, showing powerful anatomical modelling, as also casts of the spirited horses' heads in the angle. There is a Victory loosing her sandal, noteworthy for the beautiful study of drapery which it presents, and Professor Baldwin Brown has also been fortunate in securing a fine cast of the Venus of Milo, the most exquisite of all the ancient statues, in which are combined feminine grace and softness without any sacrifice of the dignity of the "grand style" in sculpture. The work of the later schools is represented centrally by that of Praxiteles—the sculptor *par excellence* of ideal beauty—chief of which are a cast of the Hermes of Olympia, which was discovered by the Germans in their excavations in 1877—the "Genius of the Vatican" and the "Demeter" from Cnidos. There are also casts of a bronze head of Sleep from the British Museum, and the beautiful smiling head of a faun from Munich, both Praxitelean in character. Opposed to the beauty and refined expression of Praxitelean work, we have that of the realistic schools, led by Lysippus, which is here illustrated by a powerful but somewhat forbidding bronze head of a boxer from Olympia.

Later works, like the well-known Psyche torso from Naples, show the continued influence of Athenian refinement of feeling, while the sculptures from Pergamon represented by a magnificent head of a giant from the great altar of Zeus on the Acropolis of this ancient city, show to how late a date (second century B.C.) lasted the living inspiration of the great realistic schools of Asia Minor. Belonging to the period after Alexander, we have a portrait bust of a Greek girl in a freer and more homely style. Attic tomb reliefs of about the fourth century B.C. are represented by several selected examples, of

which one is a sympathetically treated seated figure of a Greek lady in an attitude of grief, with her handmaid standing beside her. There is also a fine terra-cotta slab for wall decoration with figure of Hercules from the Louvre. The frames on the walls contain a chronological series of photographs of statuary, including the well-known metopes of Selinus, portions of the Elgin marbles, as also chromo-lithographs showing the use of colour on Greek buildings and sculpture. One of these is a most artistically executed print by a firm in Copenhagen, showing the possible appearance of the Parthenon façade and frieze, which it is known was decorated in that way. Representations of beautiful Greek vases, enlarged photographs of coins and gems, jewellery, Roman and Pompeian wall-paintings, and other artistic decorative works have also been secured. There is also a very interesting set of drawings—published in *fac-simile* by the German Archaeological Society, which were made by a French artist about the end of the seventeenth century, before the Parthenon was blown up. The originals, which are in the National Library at Paris, are the most authentic record extant of the appearance of the Parthenon before that catastrophe. It may be added that in the dome room has been placed a bust in marble of the late Mr. Robert Cox of Gorgie, who bequeathed the funds for the completion of this part of the University. A tablet underneath speaks of him as a "just and generous man, a learned author, and an enemy of ignorance and superstition."

### DESIGN AND COLOUR IN TEXTILE FABRICS.

THE inaugural address in the Textile Department of the Yorkshire College, Leeds, was delivered on Wednesday last week by Professor Beaumont, who took for his subject "Design and Colour in Fancy Vestings." To the student of fancy weaving, as well as to the designer and manufacturer of various classes of textile fabrics, the vesting texture, with its varied ornamentation and colouring, he said, afforded an interesting field for investigation and study. When the manufacture and designing of that fabric were successfully effected, there were ample facilities for the display of the weaver's ingenuity and the designer's executive skill, and that fact partially accounted for the production of those elaborate masterpieces of woven pattern which had marked the vesting epoch, and which were still invaluable examples of ornamental weaving, combining in their manufacture technical skill with artistic knowledge. Within the narrow limits of the sample styles now applied to woollen and worsted fabrics, practically there was comparatively little scope for the invention of novelties either in colouring, texture, or design. Although the vesting trade was not yet a complete nonentity in the West Riding of Yorkshire, where it had once formed an important branch of the staple textile trade, still it had ceased to be extended or developed as its capabilities deserved. The vesting fabric, when considered in all its relations and technicalities, probably required in its execution a more complete knowledge of weaving than any other class of loom production. An artistic taste for form and colour was but one qualification of the vesting designer, for as the development of his art design was dependent on its accurate adaptation to the loom, he must, in order to be successful in the work, be conversant with the technicalities of the weaver's craft. Woven design required distinct treatment from other species of decoration; it was not simply surface ornamentation, but a constructing of a suitable texture for developing the pattern and for the purposes to which it was intended to be applied. Every description of textile designing had, in a word, a twofold relation, for it was both utilitarian and ornamental. In order to develop the integral parts of woven design by imparting appropriate prominence to certain sections and subordinating others, a knowledge of structure of textile fabrics was indispensable. The fancy vesting designer, as a rule, displayed that technical skill in his productions whether judged from a weave or an ornamental standpoint. The vestings of from forty to fifty years ago, notably those known as quiltings, were masterpieces of ingenuity and manufacturing skill. Having given illustrations of the chief characteristics of fancy vestings—(1) the weave, (2) the design, and (3) the colours, Professor Beaumont said that one of the principal lessons to be learnt from a study of those interesting cloths was that a thorough mastery of the capabilities and technical details of the weaver's craft was at the basis of successful textile designing. Admitting that there were certain principles of form and colour common to all decorative arts, still, if proficiency in producing woven patterns was the goal before them, it was imperative that an experimental knowledge of the nature of the materials of manufacture and of the structure of the article to be produced and ornamented should be acquired. Economic and novel woven effects were only obtained in proportion as those matters were taken into consideration. Such conditions compelled them to recognise that textile designing had both its theoretical and practical rela-

tions, involving a study of those changes in fabric and design which the loom, when skilfully controlled, could be made to produce, and also of the province of colour and of materials in pattern construction. By devoting attention to those technical details, and by systematic experimental research and investigation, new and more economic processes of manufacture might be devised, and also novel principles of intertexture originated, resulting in an extension of the great textile industries of the country, whose prosperity not in a small measure affected the well-being of the whole community.

On Friday evening Professor Hummel, at Leeds, gave a lecture on "Fast and Fugitive Dyes," being the last of a series of free public lectures in connection with the Yorkshire College Evening Classes. The stability and permanence of colours, he said, was a matter of great importance to the artist who used them and to the public who admired and bought the artist's productions. It had been noticed, however, that the water-colour drawings of certain artists had very materially faded, and it became necessary that the whole list of water-colours at present employed should be thoroughly examined. This had recently been done, with the satisfying result that, although there were a great many fugitive colours employed, there still remained a good range of permanent colours available to the water-colour artist. Although the art of the dyer was not to be compared with that of the painter, he was responsible for the production of real works of art in the shape of tapestries. But when they saw with regret the faded tapestries of Hampton Court and Holyrood, it became necessary to consider whether the colours used in modern tapestries were better or worse in point of stability than those formerly employed. Of course, the most important use of the dyer's art was in the ornamentation of textile fabrics used for clothing. In discussing the subject of fast and fugitive dyes, it was necessary to define the meanings of the terms. As at present employed, they had a very wide and indefinite signification. Fast colours to one person implied that the colour would not fade when exposed to light and atmospheric influences, to another that it was not impoverished by washing, and to a third that the colour would withstand the action of certain manufacturing processes. No colour, however, was absolutely fast, and it was not necessary to demand absolute fastness from any colour. For all practical purposes it was enough to consider as a fast colour one which did not suffer from those influences to which, in the natural course of its uses, it was submitted. And the word "fugitive" had also an indefinite meaning until a qualifying statement gave it precision. Colours were faster on some fibres than on others; they were fastest on wool and silk, and most fugitive on cotton. With most colours it was probable that the fading was due to oxidation, since the air and moisture played such important parts in the matter. The fastness of a colour, however, was sometimes influenced by the mode of application, and it was necessary in order to produce the most perfect colours that the colouring matter and mordant should bear a definite relationship to each other. Having referred to the operation of "milling," or "fulling" in manufacture, in which the dyed fabrics had to withstand the action of soap and friction, Professor Hummel concluded by saying that the dyer should be thoroughly cognisant of the properties and sensibilities of all colours, and, by experiments, he should find out the best method to apply them, so that he might be able to choose those colours and those methods which gave the fastest colours to light, milling, and other influences. That was exactly the kind of work which was being taught in the classes at the Yorkshire College, and if the art of manufacture was to increase, more attention should be paid to the advantages offered to young dyers.

#### COLOUR APPLIED TO ORNAMENTAL DESIGN.

LAST week a lecture was given by Mr. Charles Stephenson in connection with the Art Department of the Yorkshire College, Leeds, on "The Theory of Colour as applied to Ornamental Design." After illustrating by diagrams and experiments the effects of simultaneous contrast of one colour upon another, the lecturer showed how they could be practically applied. Bright colours, he said, could not be formed into harmonious combinations. They should only be used in combination with broken or neutral tints, and never by themselves, otherwise the contrast would be too crude. There are two kinds of harmony—harmony of contrast and harmony of analogy. The harmonies of contrast are combinations of colours that are the farthest removed in the chromatic scale. Harmonies of analogy are combinations of the colours nearest allied. The easiest way of composing a harmonious assortment of contrasting colours is by choosing colours which have an admixture of other colours. Analogous colours are much easier to harmonise, but with these colours there is always the danger of producing dinginess, and the best way of avoiding this dinginess is to have at least one of the colours lighter in tone than the

others. Most of the patterns for woollen cloths for wearing apparel are harmonies of analogy. In these cloths great care should be taken to avoid dinginess, and especially for men's wear. In designing a cloth, this smartness or newness should never be lost sight of. Concluding, the lecturer said that anything relating to art could not be bound by rules: it would at once cease to be art. Rules can never take the place of taste or imagination, more especially in colour, but the proper observance of the laws of contrast will facilitate choice and keep imagination from being too capricious.

#### EDINBURGH ASSOCIATION OF SCIENCE AND ART.

THE first meeting for the session of this Association was held on Monday evening, Sir R. Murdoch Smith, hon. president, in the chair. Mr. John Melrose, builder, of Leith, the retiring president, gave the usual address. The membership, he said, was now 291, against 265 last year. Much attention had been given to subjects in connection with sanitary science, especially in relation to the drainage of dwelling-houses. The movement of population was in these days towards the large towns, and the changed conditions for country people in respect of atmosphere and surroundings made sanitary science of increasing importance. It was therefore proper that an Association such as theirs, which numbered among its members many mechanics and others connected with the building trades, should seek to instruct them scientifically and technically in what pertained to the means of preserving and improving public health. Other subjects to which attention had been given included important departments of art and science, photography, Persian art and industry, the iron industries, pattern-making, &c.

#### TESSERÆ.

The Renaissance Influence.

B. M. RANKING.

IN Italy, the school and the home of Mediæval art, there arose about the middle of the fifteenth century a great revolution. For five hundred years the whole art realm had been under the rule of a mighty and beneficent despotism; the North had given laws to men as to princes. But now in the fulness, or rather in the over-ripeness of time, this rule was beginning to lose those characteristics by which it had won dominion, and established its right thereto. Gothic art had fallen from its first strength and manhood into a specially terrible form of dotage, an imbecility which retained just such faint recollection of old nobility as impelled men to go on trying at repetition of what had been great with ever-decreasing power; necessarily decreasing, since at the best there was only imitation now of what had been spontaneous, and soon there was only imitation of imitation. But, though the right hand had just lost its cunning, the heart had not lost its life; it was asleep, not paralysed. To its awakening there came a voice from the ages, from those old times when Greek bowed down before the beauty he had made, because he believed in the beauty which his image sought to shadow forth; and when Roman tried to copy Greek, seeing his idea to be the noblest, there was a great rising as of the sea, that truest and most glorious emblem of humanity, and the old realm was swallowed up like a second Lyonesse, not to be forgotten, but to leave its towers gleaming up through the waves of thought and learning, as the buried abbeys shine through the waters of the Irish lake, and its memories calling to men's hearts as their muffled bells ring at the Angelus. Gothic art had become false to the world and to itself, and the heart of man, craving for truth, began to look elsewhere for its ideal. In the revival of old Classic forms truth was found, or what had been truth. Perhaps the hot-hearted seekers forgot that what was right to the ancients, because they believed in that from which it took its rise, was not right to them since their faith was different. I say this because to me, the earlier period at its best, and I think we have no right to judge of it by its decadence, is immeasurably grander than anything which has succeeded, as much finer as those all conquering Celts and Teutons were than the Southerners whom they dispossessed; but still it was a search and a yearning after truth, and therefore there came of it noble results. One special and most important form of truth there was, upon which the thinkers of this time particularly dwelt—the belief in man. In man, as a living, breathing, noble existence, not as the mere dust of the earth: in man, as the noblest thing known, as the image of that God after whom they, in their search for truth, were dimly seeking. The Mediæval mind, forgetting the old tradition of manhood, and misreading the text by which they sought to guide their actions, had come to despise this beautiful body of ours, as if it were something

to be ashamed of instead of to glory in, that man is the grandest of created beasts. This the spirit of truth could not away with, and again in the old myths there was the fitting reverence found; so in this, as in other respects, they were held unimpeachable, and the Renaissance gained ground.

#### Pietra Dura Mosaic.

C. H. WILSON.

The mosaic work of Florence differs entirely from Roman mosaic, being composed of stones inserted in comparatively large masses; it is called work in *pietra dura*. The stones used are all more or less of a rare and precious nature. In old specimens the most beautiful works are those in which the designs are of an arabesque character. The most remarkable specimen of this description of *pietra dura* is an octagonal table in the Gabinetto di Baroccio, in the Florence Gallery. It is valued at 20,000*l.* sterling, and was commenced in 1623 by Jacopo Datelli, from designs by Ligozzi. Twenty-two artists worked upon it without interruption till it was terminated in the year 1649. Attempts at landscapes and the imitation of natural objects were usually failures in former times—mere works of labour, which did not attain their object; but of late works have been produced in this art in which are represented groups of flowers and fruit, vases, musical instruments, and other compatible objects, with a truth and beauty which excite the utmost admiration and surprise. These pictures in stone are, however, enormously expensive, and can only be seen in the palaces of the great. Two tables in the Palazzo Pitti are valued at 7,000*l.*, and this price is by no means excessive. These are of modern design on a ground of porphyry, and ten men were employed for four years on one of them, and a spot is pointed out, not more than three inches square, on which a man had worked for ten months. But Florentine mosaic, like that of Rome, is not merely used for cabinets, tables, or other ornamental articles; the walls of the spacious chapel which is used as the burial-place of the reigning family at Florence are lined with *pietra dura*, realising the gem-encrusted halls of the Arabian tales. Roman mosaic is of great value as an ally to art; but Florentine mosaic can have no such pretensions, and time and money might be better bestowed. The effect is far from pleasing in the chapel I have alluded to, and I think that the art might be advantageously confined to the production of small ornaments, for which it is eminently adapted. An imitation of the *pietra dura* is now made to a great extent in Derbyshire, where the Duke of Devonshire's black marble, said to be quite equal to the famous Nero antico, is inlaid with malachite, Derbyshire spars, and other stones; but the inlaying is only by veneers, and not done in the solid as at Florence. This, with the softness of the materials, makes the Derbyshire work much cheaper.

#### The Use of Caryatids.

W. H. LEEDS.

The current legend respecting the adoption of caryatids in Greek architecture may be true or may be false; but at all events it is not necessary in order to account for pillars being shaped to resemble human figures, such figures being frequent in the Egyptian style—of course with very wide differences as to taste and design, the fundamental idea being nevertheless one and the same. Far more to the purpose is it to consider the æsthetic effect of such statue-columns, and their value in architectural composition. That while they greatly extend the resources of the latter, there is direct classical authority for them, and that in an example fraught with the most exquisite taste, is undeniable; notwithstanding which, the propriety of the taste so displayed has been called in question, or rather has been peremptorily condemned. It is contended that such figures both suggest painful ideas and partake of the preposterous. With regard to the first of these objections, it is difficult to understand wherefore statues performing the office of pillars should excite any idea of pain if they themselves express no such feeling—which of course they ought not to do—but stand calm, immovable, and indicate perfect ease and tranquillity. As to the preposterousness of employing human forms for offices which living human beings could not possibly perform, if there be absurdity in that, it is of a species which extends itself—or I might say, incorporates itself—with a very great deal of both architectural decoration and ornamental design generally. It has been said that whatever is contrary to common sense is contrary also to good taste. The validity of such dictum depends very much upon the latitude allowed to the term "common sense." If we are to understand by it merely the knowledge based upon actual experience, a very great deal that has hitherto been regarded as manifesting refined taste must be set aside altogether, and pronounced to be in very false taste. If caryatids are to be condemned as inconsistent with good taste because they represent the human form contrary to what we know by common sense it is capable of, the same authority of common sense must pronounce statues

employed as pinnacles and acroteria on pediments or elsewhere to be equally repugnant to good taste, they being placed for a continuance where real persons—if they could stand there at all—could remain for only a few minutes, and that at the peril of their necks and limbs. Again, how can we reconcile with plain common sense such classical monstrosities as arabesques or human and animal figures terminating in foliage? Nay, is there anything of common sense—that is, of plain, honest, matter-of-fact common sense—in the cramming a crowd of figures into a pediment, where half of them are perforce crouching down? Or what shall we say to such conceits as corbel-heads, or to statues fixed in between the mouldings of the head of an arch, in such manner that some of them are nearly in a horizontal position? If common sense is not startled by them, it may surely excuse what are less at variance with it, namely, caryatids, which last are at once so picturesque and elegant in effect, that their being so rarely employed may well excite our wonder. Their being frequently employed is not to be looked for, on account of their expensiveness as compared with other pillars of the same dimensions; still, what prevents their becoming too common by being applied on ordinary occasions should operate as a strong reason for introducing them where magnificence is affected, and cost becomes a secondary consideration.

#### Water Supply of London.

SIR J. RENNIE.

Spring water was formerly conveyed to public reservoirs in the City of London by leaden pipes from various springs in the vicinity, viz., from Tyburn in 1236, from Highgate in 1438, from Hackney in 1535, from Hampstead in 1543, and from Hoxton in 1546. For these useful works the citizens were indebted to the munificence of several lord mayors and other individuals, but those of Hampstead and Highgate are the only ones now remaining. The open watercourse or conduit from Dartmoor, 24 miles long, for supplying Plymouth with water, commenced by Sir Francis Drake in the reign of Elizabeth, and the New River for the supply of London, 39 miles long, 28 feet wide, and 4 feet deep, falling 3 inches in a mile, by Sir Hugh Myddelton, in 1613, are considerable works of the kind, and were planned and executed at the cost of those distinguished individuals. Myddelton was, in fact, ruined by it, and adopted the profession of engineer and surveyor to obtain a livelihood. London Bridge Waterworks were commenced by Morrys, in 1582, with water-wheels turned by the flood and ebb current of the Thames, passing through the purposely-contracted arches of Old London Bridge, and working pumps for the supply of water to the metropolis; it was the earliest example of public water service by pumps and mechanical power which enabled water to be distributed in pipes to dwelling-houses. Previously water had only been supplied to public cisterns, from whence it was conveyed, at great expense and inconvenience, in buckets and watercarts. In addition to the London Bridge and New River, several minor establishments of the same kind were afterwards erected on the banks of the Thames, to supply separate districts in their immediate vicinity. Some were worked by water-wheels on the sewers which discharged themselves into the Thames; others, by horses; and one by a windmill. That at Broken Wharf in 1594, at Shadwell and York Buildings, worked by horses, and at Chelsea by water-wheels, may be mentioned. Early in last century, when the old cisterns had nearly disappeared, and water was supplied to the dwellings, a great improvement took place by the application of the steam engine (which had then begun to develop its extraordinary powers) to the York Buildings Waterworks by Savery, in 1710, and afterwards by Newcomen in 1730. Newcomen's engines were subsequently applied at Chelsea Shadwell, Stratford, London Bridge, and the New River Waterworks. As soon as Watt had brought his improvements into operation for pumping water, his engines were applied at each of the above waterworks by degrees, in addition to the old engines.

#### The Metaphysics of Art.

VICTOR COUSIN.

Art is the free reproduction of the beautiful, and not of natural beauty only, but of ideal beauty such as the human imagination conceives it by the help of the data which nature furnishes. The ideal beautiful envelops the infinite: the object of art is, therefore, to produce works which, like those of nature, or in a still higher degree, have the charm of the infinite. But how and by what conjuring to draw the infinite from the finite? Here lies the difficulty for art, but it is also its glory. What carries us up towards the infinite in natural beauty? The ideal side of that beauty. The ideal! See there the mysterious ladder by which the soul ascends from the finite to the infinite. The artist must, therefore, devote himself to the representation of the ideal. Everything has its ideal. The first care of the artist will therefore be, whatever he does, to

penetrate the hidden ideal of his subject, for his subject has one in order to render it more or less striking to the senses and to the soul, according to the conditions which the materials he employs impose upon him, be they stone or colours or tones or words. Thus, to express the ideal, the infinite, in one way or another, this the law of art: and all the arts are such only by their relation to the sentiment of the beautiful which they awaken in the soul, by means of the supreme quality of every work which is called expression. Expression is essentially ideal: that which expression attempts to make felt is not that merely which the eye can see or the hand touch, it is evidently something invisible and impalpable. The problem of art is to reach the soul through the body. Art offers to the senses forms, colours, sounds, words, so arranged as to excite in the soul, concealed behind the senses, the ineffable emotion of beauty. The expression is addressed to the soul as the form is addressed to the senses. The form is an obstacle to the expression, and yet at the same time it is its imperious, its inflexible, its sole and only means. It is, therefore, by working with form, bending it to its service by force of care, of patience, and of genius, that art comes to convert an obstacle into a means.

#### The Author of "Vitruvius Britannicus."

F. EAST.

Up to the sixteenth century architecture was less definite in outline, less studied in symmetry—you were awed by the mass, or were charmed by the intricacy of its parts—you were arrested, it is true, but then the whole was after all only an agreeable perplexity. It was reserved for Jones and his followers to turn the stream of taste and to transplant the graces of Italy. But the followers of Jones had not very much of their master's sentiment. They seem to have followed the fashion of the time, as much as the sentiment of Palladio. Hence we find Hawksmoor and Vanbrugh easily catching the precise feeling of Grecian rule, to the prejudice of the Italian. Campbell, however, as a follower of Jones, and as a Palladian architect, seems more deserving of attention, though whether he features the original or only staggers after him is a question. In his mansions (so many of which grace our land) the sentiment of Palladio and the style of Jones seem both affected. Still you are conscious at the first glance of a stiffness in the design. You feel if an important part is to arrest that it becomes very often unpleasantly independent of the remainder; or if a change of features are successively to please, that you are not led to them by approaches sufficiently easy. The eye is not courted, it is forced. Sudden changes, too, often occur from the horizontal to the vertical, in that part where altitude is the aim; and very often in the front a sudden depression of the sides, disuniting to a certain extent the centre from the rest, and destroying in a measure the harmony of relations by a want of unity. It seems as if the artist occasionally leapt into his parts; as if notwithstanding his apparent study of every subordinate feature in the Palladian style, and of the principles of Italian arrangement, the stiffness of the copy must remain rather than the freedom of the original. It is true that you are looking at the design of a Palladian architect; that there are dispositions of the void and enriched, of the depressed and the elevated; that there are the same segmental and triangular windows in mutual relief; that balustrades crown the void, and that turrets, cupolas, columns, figures, &c., prevent you dwelling on the breadth: but then you see too much of a studied arrangement. You can almost detect the labours of the artist; you can almost discern the process by which the features of his design are apportioned; you see the architect as much as his edifice. When he introduces ornament he makes you to revel very often in a part where the eye should not remain, or he encloses a free figure in some stiff panel and destroys its expression. The decoration is not such that the part would look bare without it, or that the proportion would become affected if it was not there. You see not as in Jones the ornament as identified with the mass, but only as a part of it. You detect too much of the hand which placed it there, and too little of its relation to surrounding objects. Contrasting him with Jones, whom he imitates, or with Palladio, whom he affects, we at once see that his very study makes him miss the careless beauties of the former, whilst his caution prevents him soaring into the grand simplicity and rich excellence of the latter. Campbell thus, although of the Palladian school, is only of such in its leading characteristics. That quick perception of grace and of beauty ever necessary to relieve the huge superficies is not his. His sensibilities seem dull upon the lesser auxiliaries, so useful to design. He is not grand in his comprehension, and yet at the same time minute in his care; or if he does descend to minuteness, he does not change from the greater to the less, from the grand to the inferior with the care of a genius, but creeps into his parts with the fear of a copyist. Finally, he seems to have wanted more quickness of apprehension, more fertility of thought, and more liveliness of fancy, to have in any way equalled his originals.

#### The Royal Academy.

J. P. DAVIS.

The artists of England assuredly have done their duty. They have manifested at intervals, and by individual efforts, talents which sufficiently refute that charge of national incapacity with which foreign criticism has not scrupled to assail us, and this they have done at enormous disadvantage, for art in this country has been ridden by an incubus which has stifled its energy and crushed its independence; nor will it ever, until divested of that incubus, erect itself into the fulness of its stature and be seen in its true dimensions. I allude, of course, to the Royal Academy, an institution which differs little from others of the same sort, when and wherever established, except that it has developed in more than ordinary luxuriance the corruptions natural to such bodies. The whole history of State academies bears witness to the fact that they have invariably tended to frustrate the objects which they were meant to promote. The greatest masters of art, those especially who in the fifteenth century carried it to such supreme perfection, were no scions of academies; but, subsequently, princes and statesmen, laudably anxious that their own times should reflect something of that splendour which irradiated those of their predecessors, endeavoured to call forth new races of great artists by patronage and premiums; they instituted academies, with all the pompous paraphernalia of presidencies, professorships, lectureships, and all sorts of ships which turned out miserable craft, useless for everything but show. These forcing-houses of excellence proved in the experiment to be nurseries of mediocrity, schools of intrigue, hotbeds of pretension, and graves of talent. In the train of academies come public exhibitions, which in their character and consequences have been fatally injurious to public taste. Hundreds of pictures are got together at a given signal, and, after the managers have appropriated the best places to their own works, subjects the most anomalous, effects the most discordant are jammed together in ridiculous juxtaposition and suffocating contact. Exhibitors soon discover that amidst such a *melée*, any attempt at the refinements of art is worse than useless. Stare and glare, therefore, become the order of the day. No trick is thought contemptible provided it entraps attention, and, as it happens at a Christmas pantomime, the greatest buffoon is often the greatest favourite.

#### St. Stephen's Abbey, Caen.

E. A. FREEMAN.

It is well known that the original parts of St. Stephen's, the nave and transepts, are among the grandest, though also among the plainest, examples of the matured, though still early, Romanesque of Normandy. The church which William founded, and of which Lanfranc was the first abbot, is in every way worthy of the men who reared it. Grand in proportion, simple and severe in style, but as far from rude or unfinished work as any building can be, it is exactly the sort of church which we should expect that William the Conqueror would build. It forms a marked contrast to the rich work of the sister minster, Matilda's church of the Holy Trinity. Of course, it is not fair to compare St. Stephen's with the latter Romanesque work at Trinity, but the contrast between St. Stephen's and the earliest parts of Trinity, the parts which are doubtless due to Matilda herself, is still very striking. Matilda's church, far more elaborate in point of ornament, is built on a much smaller scale, and the composition of its interior altogether lacks the grand simplicity of St. Stephen's. The contrast between the work of William and the work of the next age at Bayeux is yet more striking. Yet we do not believe that it is merely a question of date. St. Stephen's, to our mind, bears on every stone the impress of the character of its founder. It is built in the most advanced style of the day. It shows none of those traces of an earlier style of Romanesque which hang so thickly about Bernay, and to a considerable extent even about Jumièges. It is pure and fully-developed Norman. It is grand and plain, simply because William's taste decreed that it should be grand and plain. The feminine tastes of his wife as naturally preferred a building far more enriched, but incomparably less stately. Besides its connection with the Conqueror, St. Stephen's has also another point of attraction for Englishmen in its connection with Lanfranc. The great scholar and reformer was moved from Bec to Caen, and from Caen to Canterbury. He had much to do with building at all three places, and the three minsters were consecrated in one year. The church of Bec has perished; the last traces of Lanfranc's church at Canterbury vanished hardly a generation back; but we know that Caen and Canterbury were built on the same model, and as nearly as possible on the same scale. We may fairly guess that Bec was something very much of the same kind.

The Southampton Art Society will open their third annual exhibition on the 31st inst.

## BUILDING IN OXFORD.

AN exhaustive account is given in the *Oxford Chronicle* of the principal building operations and architectural improvements that have been begun or completed in Oxford during the past year. Our space will not at present, however, allow us to make more than a brief abstract. The increase of buildings during the past century will be seen from the following table:—

Date.	Houses.	Increase of Houses.
1789	1,816	—
1801	1,878	62
1811	2,081	203
1821	2,551	470
1831	3,402	851
1841	4,335	933
1851	4,736	401
1861	5,147	411
1871	5,844	697
1881	6,588	744
Increase of Houses, 4,772.		

In the previous three centuries Oxford could have very little increased in size, as no new churches were erected in the city. In the last sixty years as many churches, exclusive of chapels, have been built and endowed as in the previous eight hundred years. The greatest increase of inhabited houses and population is between 1821 and 1841, owing to St. John's College destroying the last remains of Beaumont Palace and laying out the Beaumont Closes (now Beaumont Street and St. John's Street) and other property for building purposes in 1821, when the average number of inmates per house had risen from 4.6 in 1789 to 6.1. This was the beginning of the great building movement in the north of Oxford which led to the removal of many old close courts and alleys, and has since covered St. Mary Magdalen, Jericho, St. Thomas, St. Ebbe, Holy Trinity, Osney, St. Paul's, St. Barnabas, Summertown, St. Clement's, the Cowley district, Grandpont, and New Marston with their multitude of houses, providing better accommodation for all classes of society. The rate of increase slackened from 1841 to 1861, but was reinvigorated by the establishment of three building societies, founded in our midst during the last thirty years, encouraged by the free trade tariff of Sir Robert Peel, which took off the heavy duties on bricks, glass, timber, and other building materials. The increase in the number of houses is due in some measure to an enlarged area, but chiefly to new houses in the new and old city boundaries. Of the original 1,816 houses which existed a century ago few remain, and we cannot fully appreciate the architectural improvements, the increased and improved house accommodation in Oxford and its suburbs, without calling to mind, or endeavouring to realise from this description, the vast number of wretched old houses, alleys, and courts which have been removed in that period.

One of the important works at the University is the new Mansfield College, now approaching completion, from the designs of Mr. Basil Champneys, B.A., of which an account is furnished by Mr. S. Kemp, the clerk of works.

The buildings are grouped, forming three sides of a quadrangle, having a handsome tower with a flanking octagonal turret. The president's house and library block, which are connected by an octagonal staircase turret, forms the west wing; the lecture-room block, tower, and dining-hall block form the south side, having a frontage of about 180 feet, the tower being nearly central; the chapel forms the east side of the quadrangle. The whole of the stone for the exterior elevation is Taynton, from Messrs. Groves's quarries at Milton; for inside dressings Corsham Down has been used. The slating is by the Naunton slates, and harmonises well with the stone-work. Messrs. Parnell & Sons, of Rugby, are the general contractors.

There has been an extensive restoration to the stone-work on the north and south side of Merton College Chapel, and the porter's lodge has undergone considerable repair and alteration. Mr. Jackson is the architect, and Messrs. Symm & Co. executed the work.

Repairs and alterations have also been carried out at Exeter College, and two stained-glass memorial windows have been fitted in the north side of the College Chapel. At University College the roof of the west side of the large Quad has been stripped of the old worn-out stone slates, and has been reslated with the Westmoreland sea-green slates. The old library has also been reslated partly with stone slates from the Launton Quarries. Messrs. Symm & Co. were entrusted with the work.

The new tutors' residence in connection with this college has just been completed. The house is built adjoining the College Library, and faces Grove Place, rather out of sight of the rest of the College buildings. The house contains all the usual accommodation of a large well-arranged private residence, and is built of local red bricks, with freestone dressings to the openings, &c. The design of the house is simple and well-proportioned, the entrance doorway, and some other features, being treated with good detail and ornament, bearing evidence that the design has been carefully carried out. Messrs. Wilkins & Sons, of Oxford, executed the building work, Mr. Moore, of Oxford, being the architect.

The new president's house at Trinity College has been completed. The principal doorway is in the centre of the south front. The chief doorway has a friezed pediment, and the spandrels are filled in with traceried carving. The two leading features of the south front are bays flanked with fluted pilasters with carved capitals at either end, carried right up to the gables which terminate with three ball ornament finials. On the north front three gables break the skyline, and these, like the others on the south, are carried up to the roof ridge. At the east end bays are carried to the stringcourse above the first floor, forming five sides of an octagon, and looking into the lime-tree walk. The gables here are varied with the scalloped ornament conspicuous in several of Mr. T. G. Jackson's (the architect) recent works in the city—notably in the east front of the new schools in the High. The extent of the house over all is 90 feet by 43 feet. There are six rooms on the top floor. Clipsham stone, with Doulton dressings, has been employed for the exterior walls, and the roof is covered with Colley-Weston slates. Homan & Rogers's patent fireproof material is used in the basement and ground floors. The principal staircase is of wood, and that for the servants of stone. At Magdalen College, the residence of the president has also been finished, and was occupied a few days since.

At Brasenose College considerable progress has been made with the new block facing High Street between Ratcliffe Lane and Amsterdam Court, the roof timbers being already *in situ*, and when finished it will be a striking addition to the architectural features of High Street. The present structure consists of a new house for the principal and five sets for undergraduates, an imposing tower being placed at the west end, beyond which there will eventually be an extension. The front elevation may be described as fifteenth-century Perpendicular, and will be 42 feet in height from the ground line to the roof-ridge. In the portion eastward of the tower there are four gables. The oriel windows on the first floor have a double light in front and a single one at each side, and they have a carved parapet and moulded finials. On the ground floor two and three-light windows are inserted alternately near the tower, while at the other end there are three of two lights. In the gables the windows are of four lights, the gables having moulded copings and carved finials. At the south-east angle the oriel has six lights, and an octagonal crotched spire will be carried nearly to the roof-ridge, adding considerably to the dignity of the building. In the east façade the windows of the ground floor are of three lights, while those in the first storey and gable are of two lights. The tower will be 62 feet in height, and under it is the main entrance formed with a fine Tudor archway, with a groined roof, leading into Amsterdam Quad. At the south-east angle there will be a turret, in which will be the staircase. The front door of the principal's house is in High Street, and on the groined floor are entrance hall, dining-room, and study. On the first floor there are two drawing-rooms, six bedrooms, dressing and bath rooms, and on the top floor seven more bedrooms. The premises extend some distance northwards, where the kitchen, servants' hall, and other offices are situated. All the north-west angle of the principal entrance under the tower is the porter's lodge, and access to the undergraduates' rooms is by the turret staircase. The scouts' rooms are in the basement. The stone used for facing is Handborough, while Clipsham and Doulton are used for the dressing. The cost is estimated at about 12,000/. Mr. T. G. Jackson, of London, is the architect, and Mr. Dobson, of Colchester, the contractor.

The work of the enlargement of Hertford College has been going on during the past year, and great progress has been

made. The new building is of Classic architecture, corresponding with the old wings on either side of it, being, however, more elaborate in design. The front entrance gateway is well designed. There are fluted columns with carved capitals on each side. The ornamentations are worthy of inspection, that on the right being a little boy carrying a basket of fruit, while on the other side there is a little boy carrying a boar's head. Above the doorway is some open tracery with a shield in the centre. The external elevation is designed so as to allow the steps inside to take the line of the window-sill. The outside arches are of a pear shape, and the strings and cornices take a raking line the same as the sills below it. At each angle of the octagon the fluted balusters have moulded bases and capitals running the whole height as far as the top cornices. Above this there is a battlement of inverted arches. The first floor storey is of rustic ashlar up to the string, and from this flooring rise four columns of moulded bases, surmounted by Corinthian capitals, the carving here again being very elaborate. Immediately above this there is a carved figure extending between the windows which light the hall in the common room. The carving represents stags running right and left, with foliage filling in the groundwork above. Above this there is some heavy balustrading, with balusters between each pedestal. Upon entering the archway into the quadrangle we find upon turning to the left a beautifully-designed staircase, which is very unique, and octagonal in shape, while on the right and left of the entrance archway leading from the quadrangle into Catherine Street is a column with moulded bases and capitals with pedimented head. Clipsham and Doulton stone have been used for the exterior of the building. The architect is Mr. T. G. Jackson. The builders are Messrs. Symm & Co., Oxford, Mr. E. Long being the clerk of the works.

A new lodge has been erected from designs furnished by Mr. Moore, architect, of Oxford, in the museum grounds adjoining the parks. It is built of stone to correspond with the other buildings, and proves a picturesque little building. The style varies rather from the Venetian character of the museum buildings, partaking more of English Gothic feeling. It is built of freestone, with red tile roof, and the work has been very carefully executed by the builders, Messrs. Colston & Plumridge, of Oxford.

The handsome building adjoining the new examination schools, erected for the delegacy of unattached students, has been finished. It consists of basement, ground floor, and two storeys above, 66 feet long, facing the High, and 35 feet over all from north to south. In the basement are porter's lodgings, a day room for non-collegiate students, lavatory, kitchen, offices, &c. On the ground floor are examination-rooms for the Oxford Local Examination and the delegacy, with a clerk's room. The largest of these is 35 feet by 15 feet, and the smaller 26 feet by 15 feet. The first floor is mainly devoted to the library, which is approached by a wide and handsome staircase, the dividing wall being opened by arches with circular heads. The library itself is 31 feet by 35 feet, and is divided by an arcade of three bays, with fine pillars on moulded bases, and the arches resting upon boldly-moulded caps. The remainder of the space is occupied by a censor's room, 24 feet square, and on the top floor there are tutors' rooms, the largest 23 feet by 24 feet. The elevation, as has been said, is certainly an improvement on that of the adjoining building, with the exception of the gable finials. At the extreme end of the High Street front the windows are of three lights with moulded mullions and transoms, the lights themselves with segmented heads of the Jacobean order. The spandrels are sunk. On either side of the entrance the windows are of a single light, of the same character. Above the doorway, and immediately below the first stringcourse, is a finely-carved frieze, running the whole length of the building, and between the first and second strings is a handsome arcading in the wall of three tiers, in the centre of each bay between the windows being carved shields. The windows on the first floor are pedimented double-transomed, and each of two lights, the spandrels below each transome being sunk. The three gables are carried up almost on a level with the roof-ridge. The King Street front is certainly effective, the leading feature being the octagonal oriel at the south-east angle. The lights are three, two, and single, but on the first floor there is a large pedimented four-light window, which effectively relieves the others and lends lightness to the gables. On the left flank in the top storey is a very handsome pedimented window with carved head and three lights double-transomed. The head over all the lights is circular, pear-shaped openings filling it, and on either side in the way are carved shields. The gable above the window is a carved finial, and immediately under the pitch of the roof is a carved frieze. The circular oriel rises from the angle on an octagonal corbel, and is covered with a handsome cupola and finial similar to those in the High Street front of the school. The chimney-stacks have moulded caps. Caen and Gibraltar stone with Corsham and Doulton have been employed, and the roof is covered with Naunton slates. The architect is Mr. T. G. Jackson. The old building which obstructed the view of the

east front of the school has been removed, and a low stone wall with moulded coping surmounted by wrought ironwork erected.

### DANGEROUS DUBLIN.

THE fall of a house in North Cumberland Street, Dublin, by the falling out of the back of the structure, which took place last week, has given rise to much comment. In reference to this, Mr. Thomas Drew, R.H.A., has written a letter to the *Irish Times*, as there seemed to have been suggested a want of due vigilance on the part of the municipal authorities.

Mr. Drew says:—May I, as one well acquainted with old and dangerous Dublin, offer an opinion that our municipal officers at least do their best under unprecedented difficulties to reduce the number of dangerous structures. In an immediate emergency they usually act with promptness, judgment, and experience, gained by long familiarity with as crazy and ill-built a city as could be found in the kingdom. The fact is that the evil of dangerous buildings has grown to be so widely extended, and is increasing at so alarming a rate, that it has already outgrown the ordinary capability of a municipal authority to deal with it.

What is the problem that the public officer of health and the city surveyor have to face? That if they were to condemn as widely as they ought in the case of every more or less risky old house, they must unhouse half the working population and poor of Dublin. Setting apart the public buildings, most of old eighteenth-century Dublin is on its last legs. Flimsily and ill-built as it was, one hundred years is an extreme limit of safe old age for an average house to run to. Even of houses built in this century many have already reached the last stages of decrepitude, and are unworthy of repair, risky, or absolutely dangerous. Old Dublin, as we have it, was chiefly built between 1750 and 1800. We are in the era when it is drawing near to universal dissolution. For every one dangerous house that existed a dozen years ago we have now ten. In five years we shall have twenty. In ten or fifteen years hence it is appalling to think of the risk to human life, not to speak of the misery of existence to many in this city that is impending, unless extraordinary remedial measures are adopted soon.

The city surveyor could not possibly acquaint himself with a tithe of the houses which are risky in some degree. They are numbered by thousands, and are not all in the poorer and neglected parts of the city. Many are in the leading streets, and occupied by well-to-do business people, and are fair enough to the outside as paint and putty and stucco, or a new front, can make them. He only who knows what is behind this in many a case has a conception of the widespread craziness, of the shaken and fissured side walls, the rotten rear walls with their rotten window-frames and sashes, and the unpaired, undrained, and unlighted cellars, with their accumulations of unsanitary horrors. To enter on house-to-house espionage of all this you must be prepared to face a sort of social rebellion, an outcry against inquisitorial and coercive measures from a class hitherto exempt from much control. In leading streets it has been a reprehensible practice in converting old domestic houses into shops, to cut away the supporting walls of the ground floor, and prop up the heavy superstructure of the front and rear walls and the chimney-breasts on a few miserable sticks of timber, which generally are soon decayed at their bearing near the ground. In the lower parts of the city rapid dissolution has set in in the foundations of houses in the last twenty years. The disuse of thousands of domestic pumps since the Vartry water was brought to Dublin leaves a large area of the city water-logged. The black calp stone in the foundations relapses under water to its original condition of soft mud. Such were the conditions, for instance, under which a house fell in Grafton Street not long ago.

I often think if the line of houses in the leading thoroughfare could be stripped for one day of their shop sashes, sign boards, and pilaster facings, which dress up but do nothing for the support of the structures, what a panic would set in when it was revealed to an ordinary observer what narrow margin exists in many cases between stability and catastrophe. It is true that much danger is averted by the jealousy of neighbours in watching other neighbours' fissures and signs of collapse which may affect themselves, and the skill of Dublin builders, familiar with risky structures, averts many a catastrophe at the last moment. Of course riskiness should never be let to run to be so near a thing as this, and municipal authority should absolutely prohibit the carrying of superstructures on dangerously insufficient piers or timber props, even by those who can afford to pay for emergency repairs. The case, however, of the old and rickety houses in poor streets, with impecunious owners and occupiers, still remains a more serious problem to embarrass municipal authority. It will so remain until for one thing legislation steps in to secure a better tenure and interest, and simplification of title and transfer to the occupiers of town holdings. Further, the problem of dealing with hundreds of

houses in Dublin, such as the one that fell in Cumberland Street on Monday, should be dealt with in an exceptional and urgent way, if within every year to come there is not to be increasing loss of life and misery to the poorer dwellers in this city. Special legislation alone will meet it. Risky houses must be more widely and unsparingly condemned. Hardships on impoverished owners of such properties, dangerous to the community, must be borne by some—title, tenure, and transfer of house property must be simplified. Powers should be given to the municipality to take possession of all derelict and waste places, inclusive of any which squatters with unprovable title have attempted to occupy in the olden city. Under such an exceptional condition of things means should be devised for a more rapid and wholesale housing of the poor dispossessed by demolitions. All that private enterprise and the working of existing Artisans' Dwellings Acts can do is wholly inadequate to meet the emergency in Dublin where such a crisis of houselessness is impending. To leave the administration in this heavy matter to the ordinary machinery of an official public officer of health, a city surveyor, and an inadequate staff of ordinary "inspectors" would be useless, in face of the facts that the evil has already gone beyond their ability to cope with it, and they have other and manifold routine duties already too onerous.

A special commission of high skill is wanted to deal with a great and exceptional social evil, and it should be armed with such legislative powers as have not yet had a precedent in any town of Great Britain or Ireland.

Mr. W. R. Maguire, writes:—My experience both as a sanitary engineer and as an old citizen agrees with this startling testimony. My business during sanitary inspections requires me specially to note the condition of the subsoil, the foundations, and the structure of houses. Every house should be capable of standing firm, erect, and independent on its own foundations. That such is not the case in Dublin may be aptly instanced by the fall of a house in Grafton Street (opposite the Provost's and next to Mr. North's premises), which collapsed soon after the neighbouring house had been taken down for rebuilding, and also by the state of my own business premises in Dawson Street about the same period, when we found the walls cut away exactly as described by Mr. Drew, and were compelled to rebuild thoroughly the rear and supporting walls. Our Corporation should possess ample powers and machinery to inspect all buildings, new and old, and to execute promptly all works necessary for the stability of the city and safety of the citizens. That such is not the case may be fairly inferred from the prolonged existence of the dangerous structure or ruin in Stephen's Green, at the corner of York Street. One has only to look from the top back window of any house, even in the best streets, to see the unsafe and rickety back walls of many houses. The present Corporation officials have their hands full. We want a new independent department and additional powers, as explained by Mr. Drew, and at the head of this department a first-class architect should be placed, whose art and experience has taught him to prefer sound building construction before ornamentation or picturesque effect.

Mr. Drew alludes to the fact that the complete cessation of the practice once universal in Dublin of pumping water daily from shallow wells for domestic use has allowed a permanent rise of impure subsoil water under large areas of this city. Twenty years ago, at the period of this cessation, the vast majority of drains under houses were formed of pervious built brick or stonework. Now we have the majority of house-drains formed of impervious pipes with cement joints, which, if properly constructed, provide no escape for subsoil water, nor in the vast majority of cases are any proper means adopted to render the subsoil safe and dry. The old built drains while admitting foul sewer air freely into houses, made some amends to householders by very effectually draining off subsoil waters through numerous defects in brick or stonework, except in frequent cases where drain stoppage occurred, or in low lying districts where the tides backed up and saturated the subsoil with returning foul drainage through leaking drain walls. It is in cases of this description that the bad effects arise which your correspondent "Pro re natâ" mentions and asks a remedy for, as being an evil of greater note than that of crumbling houses. The subsoil is dry and drained, but foul emanations, nevertheless, proceed therefrom, and rise through the house. Many Dublin houses stand on this dangerously drained dry subsoil still, and many more stand on a subsoil saturated with foul stagnant water even in the best parts of Dublin, which are often described in advertisements as having their "drainage perfect." There is a simple remedy for this dangerous condition of the drainage and subsoil which any architect or sanitary engineer ought to be able to provide if applied to in the ordinary way of business, not, however, through newspaper correspondence, which, though drawing public attention to such evils, cannot fairly be asked to take the engineer's place and furnish specifications for works to be done.

As the Lord Mayor and Corporation are about investigating

the constructive safety of Dublin houses, there is one point concerning house-drainage of a technical but extremely practical and important character I again beg to draw attention to specially. I have already done so more fully in a paper read before the Sanitary Congress, which can be still obtained. Here I shall only say that the connecting pieces or junctions on the main sewers are wrongly placed opposite the hall-door steps and scullery in the great majority of Dublin houses, so that it is almost always impossible to provide a straight line of house drain, as it should be laid, from the back area to the front area. It is of very great importance to health that the house drain should pass out across and under the front area straight to the public sewer, instead of, as at present, being carried, with many bends, out under the scullery and hall-door steps. There is not space to explain the reasons or give diagrams, but I believe that if the right course was followed in this simple matter in Dublin, the death-rate would be lowered very remarkably indeed.

#### THE LATE MR. THOMAS S. MUIR.

THE death of Mr. Thomas S. Muir took place on the 10th inst., at Albany Street, Leith. The *Scotsman* says the announcement of the death of Mr. Muir will be received with regret by many readers, not only in Edinburgh, but in the remotest corners of Scotland and throughout the Isles of the Northern and Western Seas. Born on January 1, 1803, he has passed to his rest at the ripe age of eighty-five years. He received a good education, and during the early part of his life mixed in the best society, when it was the fashion for gentlemen to go out to dinner in a sedan-chair, and place their own spice-boxes by their plates at table. But as he came to maturer years he relinquished social enjoyments, and became absorbed in the one pursuit which was ever afterwards the passionate devotion of his life. He was not an antiquary in the ordinary acceptance of the term, and he had no special regard for the dry-as-dusts as a body; but he was possessed by an intense desire to popularise the subject of ecclesiology in Scotland, and to this object he steadily devoted his means and his leisure for more than forty years. With an inborn love for ecclesiastical architecture, he made the remains of the early Scottish churches his peculiar study, and was the first to systematise and make plain to the popular understanding the distinctive features of the different styles and periods in Scotland.

The little volume, now rarely to be met with, entitled "Notices of some of the Ancient Parochial and Collegiate Churches of Scotland," which was issued by Messrs. Parker, of London, in 1848, was his first literary venture. It was succeeded by a second essay, published by J. Lendrum, Hanover Street, Edinburgh, in 1855, and entitled "Notes on Remains of Ecclesiastical Architecture and Sculptured Memorials in the South of Scotland." Neither of these ventures succeeded to his anticipations, but in 1861 a third work, wider in scope and better illustrated—"The Characteristics of Old Church Architecture on the Mainland and Western Islands of Scotland"—was published by Messrs. Edmonston & Douglas, and met with a much more cordial reception. In the meantime, he had given himself to the task of visiting every undescribed ecclesiastical ruin in the country—no matter where it was, or whether there was anything left in the way of architectural characteristics to be described. However inaccessibly placed it might be, it had to be seen, and if it had nothing else, it had a ground plan, or part of one, which could be placed on record for comparison with others. The utterly neglected and unknown churches in the remoter districts of the Highlands and islands had a peculiar attraction for him. Although they were rudely constructed, their plans often exhibited features which gave rise to unsolved questions as to the succession of typical forms in the history of ecclesiastical architecture, while in almost every case their graveyards were studded with monumental sculptures. Wherever he went—and he went everywhere—he left no ruin undescribed and no monument unnoted. Of the better preserved ruins he made carefully measured plans, and of the more ornate monuments he made equally careful rubbings. His sketches of ruins and monuments, whether with pen or pencil, are faithful and full of character. When on these journeys, usually in the months when the days are long and the twilight lengthens into day, neither stormy weather, sea-sickness (to which he was occasionally subject), nor semi-starvation could deter him from his purpose. Many an adventurous boat he launched by the persistency of his persuasive tongue, when the unwilling boatmen would fain have waited for a better day; and many a droll scrape he and they got into, with the weather, and the tide, and the fading daylight, and the improvidence of trusting to be back in time for supper. He went twice to North Rona and the Sule Skerry; the Shiant Isles, the Hannan Isles, St. Kilda, Foula, and Fair Isle, all tempted him in turn; and in

the years between 1850 and 1872 there was not a nook in all the Highlands, nor an islet in the Northern and Western Seas that was likely to retain a trace of an ecclesiastical ruin that he had not visited. His journeys were always made alone and on foot, in his annual holidays—all too brief for the objects to be crowded into them before the return to business.

Perhaps there was nothing more characteristic of the man than the ease with which on these occasions he shook off the impeding habits of a town life—taking whatever kind of food he could get as the opportunity presented itself, sleeping under any shelter or none, and foregoing the customary solace of a pipe, which was a quite regular habit in his ordinary life. Stranger than all, he did occasionally provide for the possibility of being cast away on some lonely isle, and laboriously carried with him to the most outlandish places a barrel packed with eatables, delicacies in due proportion, and drinkables on similar terms—a bottle or two of choice Madeira or claret—which were after all most carefully brought back again. Readers of his inimitable little sketches knowing this will read into some of them “the fun of the thing,” as he himself occasionally saw it. On such excursions he was a most interesting companion to meet with, though he sought no companionship he could readily avoid. No one could make much of him till his object for the day had been attained; but he was always cheerful and chatty in the evenings, whether he found shelter in the shieling or the hut, in the manse or in the mansion-house, as sometimes happened. Yet, after such delightful intercourse, which might have been expected in many instances to ripen into warmer friendship, he was off like a shot in the morning on some other outlandish expedition. Thus, although many were attracted by his peculiarly lovable and interesting character, he was shy of forming friendships on general terms, and it was only given to a very few to know the sweetness and light that lay concealed under the hesitancy and reserve of his ordinary manner.

The results of these solitary journeys of exploration were embodied from time to time in a series of booklets, nine or ten in number, now well known to collectors. These he wrote and printed privately as the spirit moved him, sometimes illustrating them with woodcuts made with special care and supervision from his own drawings, sometimes with etchings by himself; and at other times the booklet was printed with blank spaces in the type for certain illustrations which could neither be entrusted to the woodcutter nor to the etching-plate, but were afterwards filled in with drawings in pen and ink. They were mostly limp quartos, sometimes covered in black glazed cloth, and sometimes in unbleached canvas, and as they were occasionally limited to an impression of twenty-five copies, the appearance of one or other of them at rare intervals in an auction-room, and the competition for them at such fabulous prices as they brought, afforded him no small delectation. These were all collected in one volume, with an introductory chapter, not previously printed, giving a *résumé* of the whole of his wanderings among the islands, which was issued by Mr. David Douglas in 1885.

Apart from their scientific value, Mr. Muir's sketches are full of character, enlivened by the genial sayings of one “who, instead of worrying you to his theme, simply woos you to it, and leaves you to worry out for yourself what it is like and what it is worth.” Child-like himself, he delighted in the company of children. It gives a curious insight into this phase of his character to note how he hit upon that singular conjunction of his two favourite enjoyments which led him to appear before the public—the very last thing that he would ever have thought of had it not been for an object so dear to his heart. Admitting no one to his confidence but his small and very familiar friends, he made the boldest venture of his life—a public exhibition of his far-gathered “Rubbings.” The idea was that there would be a rush of antiquaries and other curious people to “the show,” and a big bag of shillings to be carried in triumph to the Sick Children's Hospital. So in November 1871 he took one of the public halls, pinned up his exhibits in black-and-white with anxious care, printed a catalogue—a really valuable monograph of the subject—advertised in the newspapers, and waited the result, which he afterwards described so humorously in one of his sketches as “not precisely a failure.”

It is also a characteristic indication of his extreme modesty that his name does not appear on the title-page of any of his books except the last, and in this case not by his own desire.

During the greater part of his life he was bookkeeper to Walter Cockburn, West India merchant, Edinburgh; afterwards for a few years to his son, Isaac H. Cockburn, Leith; thereafter he managed the estate of Melville Hall, in Dominica, the property of the late John Whyte Melville, of St. Andrews. A small legacy from his old master and what he earned sufficed for the wants of a very frugal life, in which all his spare means were devoted to the expenses of his many journeys and his little books.

#### KIRKSTALL ABBEY.

AT the meeting of the Leeds Town Council, on Thursday last week, Mr. E. Wilson proposed a resolution that the Council should purchase Kirkstall Abbey and the enclosure, containing about twelve acres of land, subject to the existing lease to the late Mr. Butler, provided they could acquire it for 6,000*l*. There was no one, he said, in Leeds who was not well acquainted with Kirkstall Abbey, but possibly there were many so well acquainted with it that they did not recognise what a splendid ruin they had in their midst. There were not more than two of the ruined abbeys in Yorkshire which could be placed before Kirkstall in order of merit. There was no one present, he was sure, who would not raise his hand against any suggestion that Kirkstall Abbey should be in any way destroyed or prejudiced, and yet it was a fact that from neglect that ruin was perishing day by day. Those who had been to see it, and had compared its appearance now with what it was when they were younger, were struck to see how rapidly it was decaying. Something must be done; for, under the present ownership, little or nothing was likely to be done. Mr. Butler had taken a lease which would last till 1893. They were told that the abbey was going into the market, and in all probability it would change hands. It had therefore occurred to him, and he hoped the idea would be supported by every member present, if the ruin was to change hands, the Corporation of Leeds were the proper persons to own it. They had been urged for some time past to provide a recreation-ground on that side of the town, though whether it was a suitable place for the erection of swings and other popular institutions he did not know. He had for a long time been in negotiation for the purchase of the abbey, with a view to being able to offer it to the Corporation, and he had arrived at a price with the agent. But a committee of gentlemen, who also were endeavouring to secure the abbey, on learning from him of the arrangement made, had gone to the agent and offered 500*l*. more, so that it had been decided to bring it to the hammer. He did not know how that might strike them as commercial gentlemen. He did not know now whether the abbey could be acquired for 6,000*l*.; but it would be foolish to go prepared with a less price, because that sum had already been offered, while it would be unwise to suggest a less sum.

Mr. A. Cooke seconded the resolution.

Mr. John Gordon expressed his opinion that they would be unable to purchase the abbey by private treaty. He and a number of other gentlemen had been endeavouring to purchase another portion of the Cardigan estate, but the trustees had laid down a strict line and declined to have any negotiations, being determined that it should go to the auction sale. He had not the slightest doubt that they would get the estate for 5,000*l*.; the only fear was that some one might come and keep them out of it. The public of Leeds would give them a free hand and keep out of their way, and all they had to be afraid of was the speculator. Still he did not think any man devoid of sentimental feeling would give as much as 6,000*l*. merely as a speculation. He suggested that the necessary steps towards completing the purchase should be left in the hands of Mr. Wilson.

Mr. Arnold Lupton seconded the suggestion.

Mr. Wilson said the owners of the estate attached, or desired to attach, to the sale some obligation to preserve it. He did not mean to say the property was to be kept exactly in its present state for ever, but that the land was not to be built upon, and that the ruin was not to be destroyed.

The resolution was adopted, with the understanding that Mr. Wilson, Sir E. Gaunt, and the town clerk should be authorised to make arrangements for the purchase.

#### EXHIBITION OF DECORATIVE HANDIWORK.

SOME months ago it was suggested, the *Scotsman* says, that the cause of artistic handicraft in Edinburgh and in Scotland generally might be usefully advanced by the holding of an exhibition of decorative work in its various branches. It was pointed out at the first meeting held to consider the project that there is little or no help available for the craftsman who wishes to improve the artistic character of his work, and to advance beyond the limits of ordinary workshop practice. Though he may have gained in early life some artistic knowledge and skill at the School of Art, when he settles down to the business of his craft he is left pretty much to himself. It was felt that a useful stimulus would be given to his efforts if he were afforded the opportunity of displaying what he could do in really artistic work when freed from the moment from the mere pressure of trade demands, while he might be further aided by bringing under his notice standard examples produced in the best periods of the past. To evoke
